No Milestones in Timeline Model

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The ClarisImpact box states: "...Manage projects using Gantt charts with customizable plan/actual task bars, milestone markers..."

ClarisImpact 1.0 does not contain a milestone marker feature, and the terms "milestone" and "Gantt" are not used in the product's electronic help. Although "Gantt" is not listed in the index, the ClarisImpact User's Guide describes Timelines beginning on page 8-2 as follows: "ClarisImpact creates simple timeline charts that are suitable for scheduling and tracking a wide range of projects. Timelines, also called Gantt charts, represent task durations as bars on a time scale."

A milestone, as described in the Claris MacProject Pro manual, marks a phase of a project. "Milestones typically mark the beginning and end of a project and any interim goals for a phase of the project or a set of tasks. They serve as visual clues for significant progress points along the way."

To create a simple milestone in ClarisImpact, it is possible to define a task with zero duration. This will appear as a small shape (diamond, circle or another shape that you might select) in the timeline, not as a line like other tasks.

Claris Applications: Palatino Font Clipping when Printing

eWorld 1.0 (a software application for accessing eWorld, an online service from Apple) installs a different version of the Palatino font.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The eWorld 1.0 Installer disk places a TrueType Palatino font suitcase into the System during the course of the installation. Unfortunately, the font is corrupt, and the inter-character spacing is different than the spacing of the Palatino font that is replaced. This will result in text clipping in any documents that had been previously created using the system installed Palatino font. Apple Computer is aware of this problem.

The only workaround is to reinstall the old Palatino font.

ClarisWorks: Printing White Text With A Colored Background

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Seeing through bitmapped graphics when you print them on a LaserJet 4?

If the printer driver's graphics mode is set to Raster, any objects behind your bitmap will show through. Your bitmap will also show through any objects placed on top of it. To print opaque bitmapped graphics on a LaserJet 4, open the control panel, click on setup/options. In the graphics mode box, select HP-GL/2 instead of raster. This will also improve your printing speed.

What is HP-GL/2? HP-GL/2 is a vector graphics language that basically turns your printer into a plotter. The HP-GL method of printing requires less memory on the printer and prints faster than raster. The HP-GL feature was added to the PCL language in PCL level 5, and is supported in Hewlett Packard LaserJet 4 printers.

ClarisWorks: Changes And Fixes In The Windows 3.11 Upgrade

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Windows 3.11 does NOT include any new features. This is an update to standard Windows, and is separate from the Windows for Workgroups 3.11 software package. The Windows 3.11 upgrade fixes some driver issues and adds additional support files for Novell Netware.

The following is a list of the updated drivers in Windows 3.11:

PSON9.DRV
EPSON24.DRV
FINSTALL.DLL
FINSTALL.HLP
HPLJIV driver
HPDSKJET.DRV
HPPCL.DRV
HPPCL5E.DRV
HPPCL5E.HLP
HPPCL5E1.DLL
HPPCL5E2.DLL
HPPCL5E3.DLL
HPPCL5E4.DLL
HPPCL5E0.DRV
HPPCL5MS.DRV
L100_425.WPD
L300_471.WPD
L300_493.WPD
L500_493.WPD
L200230&.WPD
L330_52&.WPD
L630_52&.WPD
PAINTJET.DRV
PSCRIPT.DRV
PSCRIPT.HLP
UNIDRV.DLL
V7VDD.386
V7VGA.DRV

In Windows 3.11 upgrade some of the core files were updated to fix some minor problems listed below.

COMMDLG.DLL - was modified to allow Windows-based programs on diskless workstations to use the common dialog boxes provided by this DLL

GDI.EXE - was changed to help programmers using graphics calls, especially those calling the "draw rectangle" function.

KRNL386.EXE - was slightly modified to prevent problems that may occur when third-party software calls for windows to shut down before focus returns to Program Manager.

PSCRIPT.DRV and UNIDRV.DLL- were updated to eliminate a problem that occurs in Windows 3.1 when a word processor uses more than 60 fonts in a single document.

VTDA.386 - solves a timer- related problem that sometimes occurs when you start an MS-DOS-based application on a Novell NetWare network. This problem occurs a very small percentage of the time under Windows 3.1, and shows up usually as Windows crashing to a black screen with a blinking green bar in the top left corner. This problem is also referred to by Novell and Microsoft as the "Black Screen of Death".

Microsoft Windows: Workgroups 3.11 Compatibility List

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This document provides a list of components that have passed the Microsoft Compatibility Test for Microsoft Windows for Workgroups version 3.1. This list is not comprehensive and is subject to change.

Products that are excluded from this list have not been tested by Microsoft, and may or may not be compatible with Windows for Workgroups. In addition, the manufacturers of these components may have updated the hardware since this list was compiled, causing products to no longer to be compatible with Microsoft Windows for Workgroups.

This list is divided into the following four sections:

- Hardware Compatibility List for Computers
- Hardware Compatibility List for Network Interface Cards (NICs)
- Hardware Compatibility List for Microsoft At Work PC FAX (AWFAX)
- Hardware Compatibility List for Remote Access Services (RAS)

Windows 3.1: Must Use WinFax Pro v2.0 Or Later

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In order to use WinFax Pro with Windows 3.1 you need version 2.0 (dated 11/28/91), or later.

If you are running Windows 3.1 and FaxPro 2.0 on a 286 it may take a long time to send or receive a fax. Along with this you may encounter missing characters.

FIX: Remove all terminate and stay resident (TSR) files from your AUTOEXEC.BAT and CONFIG.SYS files. If you are running MS-DOS 5.0 you will need to add the line DOS=LOW to your CONFIG.SYS. Next you will need to open the SYSTEM.INI with a text editor and add the following line to the [Standard] section: FasterModeSwitch=1

If when you are running WinFaxPro the system hangs while you are running in 386 Enhanced mode, you will need to add the following lines to the [386Enh] section of your SYSTEM.INI file:

COMBoost Time=15
COMxProtocol=XOFF
COMxBuffi=1024
COMxAutoAssign=0

NOTE: The x after COM in the last three lines represents a valid COM port. Be sure to substitute the correct COM port number when you add the lines to the SYSTEM.INI.

There is another potential problem with version 1.0 of Berkeley Systems' After Dark screen saver. When running After Dark while using WinFaxPro, After Dark may interfere with fax transmission.

FIX: Turn off After Dark when using WinFaxPro.

Delrina also recommends that you do not run either of the two programs form the LOAD = line in the WIN.INI file.

If you are experiencing problems running at 14.4Kbps, contact Delrina about an update to fix this particular problem.

NOTE: A number of computers currently ship with OEM versions of WinFax. If this is the case with your computer, please contact the hardware manufacture concerning problems with its version of WinFaxPro. Version 4.0 can be obtained by contacting:

Delrina Corp.
6830 Via Del Oro
Suite 240
San Jose, CA 95119
(408) 363-2345

WinFax is now owned by Symatec Corporation which can be reached at 408-253-7234.

Banyan VINES 5.52 (5): Using With Windows For Workgroups 3.11

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Bulletin Number: 300
Date: 22 April 1994
Summary: NetBIOS and Windows for Workgroups
Server: All
Software Version: VINES 5.52 (5) and greater, Windows for Workgroups 3.11
Category: Windows for Workgroups, NetBIOS

***** When trying other setups, remember that Banyan DOS NetBIOS requires the use of LANA0, but can share it with VINES and perhaps other protocols.*****

Introduction

This technical bulletin describes using Banyan's DOS NetBIOS implementation with Windows for Workgroups to enable enterprise-wide file sharing.

The scenarios described in this bulletin work only with Windows for Workgroups 3.11.

Communicating over Banyan DOS NetBIOS

Banyan site-specific patch 5.53(6)-VNS-KG-1 updates Banyan's DOS NetBIOS client software. This software patch allows Windows for Workgroups to ignore the single LAN segment restriction normally imposed by other implementations of NetBIOS.

All users in a workgroup who connect to the same Banyan NetBIOS naming service can share resources as specified by Windows for Workgroups regardless of physical location. They can also share resources with machines on the same LAN segment which are only using Microsoft's NetBIOS (such as Windows NT or NTAS workstations).

Modifying your workstation configuration involves:

* Configuring the workstation's network setup
* Editing the AUTOEXEC.BAT file
* Editing the PROTOCOL.INI file

Configuring the Workstation's Network Setup

Use the Network Setup applet in the Network program group and the Network applet in the Control Panel to configure the workstation's network settings:

1. Double-click the Network Setup icon in the Network program group. The Network Setup dialog box appears.
2. Choose the Drivers button. The Network Drivers dialog box appears.
3. If the IPX/SPX transport with NetBIOS driver appears, select it. If it does not appear, proceed to Step 5.
4. Choose Remove. The IPX/SPX driver no longer appears in the list.
5. Select Banyan VINES.
6. Choose Set as Default Protocol. This sets Banyan VINES as the default protocol.
7. Choose the Close button. The Network Setup dialog box appears.
8. Choose the OK button.

Use the Network applet in the Control Panel to make sure all users who will share resources belong to the same workgroup.

At each user's workstation:
1. Double-click the Network icon in the Control Panel. The Microsoft Windows Network dialog box appears.

2. Make sure the Workgroup text box displays the correct workgroup name.

3. Choose the OK button.

To Edit the AUTOEXEC.BAT File

When you make changes through Network Setup, the workstation AUTOEXEC.BAT file may get modified and leave you with a configuration that may not work correctly.

1. Use a text editor to open the AUTOEXEC.BAT file.
2. Make sure the network commands in the AUTOEXEC.BAT file are listed in this order:

net initialize
cd <vinesdir>
ban /nc
ndisban
net start
arswait
redir <4, all>
z:\\login

where <vinesdir> is the directory containing your Banyan network software and <4, all> are the two versions you can use (either REDIR4, or REDIRALL).

3. Check that the REDIR version is the one you want. In some cases, the setup program adds REDIRALL by default.

4. Save and close the AUTOEXEC.BAT file.

To Edit the PROTOCOL.INI File

1. Open the PROTOCOL.INI file using a text editor.

2. Locate the [Network.Setup] section.

3. Set LANA0 to ban$vines, if it is not already.

4. Locate the [NETBEUI] section.

5. Change the LANABASE entry to match the LANA for ms$netbeui (usually 1) from the network.setup section. If there is no LANABASE entry, add the line:

LANABASE=1 (or the correct number for your setup)

6. Save and close the PROTOCOL.INI file.

This completes the workstation modifications. You must restart your workstation for these changes to take effect.

The next section describes a different scenario, configuring your Windows for Workgroups workstation to use the distributed features of Banyan's DOS NetBIOS implementation for applications only.

Using Banyan DOS NetBIOS

When using Banyan DOS NetBIOS with Windows for Workgroups, keep in mind:

* Banyan DOS NetBIOS must be loaded before WFW starts if you are to use it for sharing.

* The default parameters for PCNETB may not be sufficient. If you receive error messages or notice poor performance, use the following settings for the /nam and /ses settings:

/nam:32
/ses:16

* Depending on how you use the workstation, you may receive a message that NETHEAP needs to be increased. This message gives you instructions and suggests a new value for the NETHEAP setting.

When trying other setups, remember that Banyan DOS NetBIOS requires the use of LANA0, but can share it with VINES and perhaps other protocols.

ClarisWorks: Using SoftWindows

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks for Windows requires a 386 (or higher) CPU, due to the fact that it requires Windows to be running in 386 Enhanced Mode. This is not possible on 286 (and lower) machines, or on any machine which lacks a sufficient amount of RAM.

SoftWindows software from Insignia Solutions allows Macintosh users to run Windows and Windows-based programs on their Mac. However, at the present time SoftWindows emulates Windows running on a 286-class machine and therefore does not support running Windows in Enhanced Mode. Consequently, ClarisWorks for Windows will not run on a Macintosh (including Power Macintosh computers) running SoftWindows.

This will change if/when Insignia Solutions produces a version of SoftWindows which supports Enhanced Mode. In the meantime, customers can purchase ClarisWorks 2.1 for Macintosh (or the native Power Macintosh version).

ClarisWorks: Spell Check May Check the Entire Database

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you have a selected record or group of records and choose Spelling - Check selection, you would expect that ClarisWorks would ignore the unselected records.

Actually, it may go to the first UNSELECTED records and start the spell check from there, including selected and unselected record(s).

The solution is to choose "Hide Unselected" from the Organize menu before beginning the spell check.

Calculating Elapsed Time and Pay Rate (DB)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you have a ClarisWorks database with two time fields (StartTime and EndTime) and you wish to calculate a pay rate based on the elapsed time, here are calculations to accomplish that goal:

If you don't already have the following fields defined, create them:

StartTime (time)
EndTime (time)

Now to calculate the total elapsed time, define the following field:

ElapsedTime (calculation, number result)
=TIMETOTEXT('EndTime'-'Start Time',2)

See TechInfo Brief entitled "Calculating Elapsed Time" for a full explanation.

Next assuming the hourly rate is $20 an hour, create the next field:
PayDue (Calculation, Number result)
=((HOUR('end time')+MINUTE('end time')/60)-(HOUR('start time')+MINUTE('start time')/60))*20

If hourly rate is a constant other than $20, Substitute the last number (*20) for the constant hourly amount.

To provide for a variable hourly rate (different for every record), create another field:
HourlyRate (Number)

The PayDue calculation can then be modified to:
PayDue (Calculation, Number result)

=((HOUR('end time')+MINUTE('end time')/60)-(HOUR('start time')+MINUTE('start time')/60))*HourlyRate.

ClarisWorks:Adjusting Custom Label Layouts that Shift When Printing

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When creating custom labels in a ClarisWorks database, there are four parameters or values that you must consider to ensure that labels maintain proper alignment when printing. Two parameters tune or adjust in the horizontal direction and the other two adjust in the vertical direction.

These parameters are:

*Offset - distance from the edge of the sheet to the edge of the first label
-Vertical Offset - the distance from the top edge of the label sheet to the top of the first label.
-Horizontal Offset - the distance from the left edge of the label sheet to the left edge of the first label.

*Drift - The shifting of the information in relation to the borders of successive labels, which results in the information no longer being properly aligned on the label as the printing progresses.
-Horizontal Drift - Shifting in the Horizontal direction
-Vertical Drift - Shifting in the Vertical direction.

Offset is adjusted in ClarisWorks by setting the Top and Left Margins. Only the top left label is used as a reference for adjusting offset. Using other label positions will make it difficult to properly adjust offset. Offset must be adjusted first before adjusting for drift, otherwise the drift adjustments will be improper and the labels will not align.

Vertical Drift is corrected by adjusting the height of the body. Small movements may result in significant degrees of shift since the results are additive across records. For example, when adjusting one inch labels (10 down on a sheet) a movement of 1/16 of an inch will result in the 10th label moving 5/8 of an inch.

Horizontal drift in ClarisWorks is not adjustable, but is set by accurately entering the Horizontal width of the label when creating the label layout.

Based the above information, the following steps will create a proper label layout using a minimum of steps:

I. Before creating the label layout
A. Be sure your sheet of labels contain a top margin and a left margin. Label sheets not having margins are designed for copy machines, not printers, as printers cannot print to the edge of a page

B. Using a ruler, measure the top margin; left margin; width of the label from the left edge of the label to the left edge of the next label immediately to the right; and height of the label measuring the label by measuring from the top edge of the top label to the top edge of the label below it. It is ok and proper to include any space in the label measurements. If the label in only a single label across, just use the height and width of the label for the label measurements. Do not rely on the measurements printed on the box as they may not be the ones you actually need to set up the labels.

II. Create the Layout
A. Go to Layout mode and choose Layout menu, New Layout.

B. Choose the Labels option, click OK and enter in the Avery Number for a predefined setup or your custom label measurements. Click OK

C. Double-click on the fields on the left side that you wish to be on the labels. Click on them in the order you want them to appear. This will move them to the right side and is faster and better than the Move button as you are not as likely to click the OK button by mistake. When done, click OK.

D. Position the fields as you want them to appear on the label. Slide Objects is automatically chosen for label layouts.

Use the Alignment tool to align the top edges for sliding left to occur properly. Do not allow field handles to touch each other header line, or body line, as this will result in printing issues. You can be as close as 1/72" but not actually touching.

Use the magnification tools to zoom, the size box and deselect Align to Grid to assist you with this.

TIP: the arrow keys will allow you to move the selected fields in a single direction in small increments.

III. Test the label setup
A. Create enough records, if not created already, to print a full page of labels.

B. Print a page of labels by choosing Print under the File menu and printing from page 1 to 1 on a blank sheet of paper.

C. Hold the printed paper to the light with the label paper in back of it to check alignment.

IV. Offset Analysis
A. Compare the test sheet to the label sheet and look at the top left label only.

B. If the top left label is aligned correctly both horizontally and vertically, go to the drift analysis section below.

C. If the label is out of alignment horizontally, adjust the left margin to compensate - i.e., if the field are too far left, reduce the margin

D. If the label is out of alignment vertically, adjust the top margin . Increase the margin size if the fields are too high. Reduce the margin size if the fields are printing too low.

E. Run another test print and check your results again and repeat this operation until offset is corrected.

V. Drift Analysis
A. Compare the test sheet to the label sheet and look at the bottom right label. Top labels will not assist you with this adjustment.

B. If the label is out of alignment horizontally, recheck you ruler measurements as you will have to start over and recreate a new layout to reset the horizontal width. After choosing Layout menu, New Layout and selecting Labels as the type, be careful to enter the correct width for the new label. In the resulting "Set Field Order.." dialog, you will need to place at least one field on the new label layout. However, it can then be deleted and your fields on the previous layout can be copied and pasted into the new one.

C. If the label is out of alignment vertically, correct the issue by adjusting the body line. If the fields printing are too high, increase the label height by moving the body line down a little. If the fields too low into the bottom margin, reduce the label height by moving the body line up a little.

D. Run another test print and check your results again and repeat until drift no longer occurs.

Your labels should now be properly aligned.

Installing PowerTalk on the Power Macintosh with An Upgrade Card (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Version 2.1 of the ClarisWorks program supports sending mail using PowerTalk from Apple Computer (part of System 7 Pro).

If you are having difficulty sending mail in ClarisWorks, you may wish to try sending mail via AppleMail. If that fails also, it's possible that your PowerTalk may need to be reinstalled.

PLEASE NOTE:
It has been reported that a problem was discovered with the installer script on the PowerTalk For Power Macintosh (1.0.3) Install Me First disk, where it would not install properly on systems with Power Macintosh Upgrade Cards. This problem does not exist on the PowerTalk For Power Macintosh (1.0.2) Install Me First disk. Except for the installer script, the software contained within the 1.0.2 & 1.0.3 Install Me First disks is identical. Apple is recommending that customers use the 1.0.2 PowerTalk Install Me First disk when installing PowerTalk on Power Macintosh and Power Macintosh Upgrade Card systems.

Please contact Apple Computer or your Apple Dealer if you feel you need new PowerTalk disks.

"The Document was not created by ClarisWorks" when Attempting to Open a Paint Document (PT)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you try to open(by double clicking) a file that has been saved as a ClarisWorks paint document, you may receive the following error message: "This document was not created by ClarisWorks".

Solution: Check to see if Easy Open is running. To do so, Select Control Panels from the Apple menu and Double Click on Easy Open.

Description: Easy Open is a utility that comes with System 7.1P (for Performas). It is designed to provide seamless translation between many applications. There have been some reports that Easy Open is causing ClarisWorks not to recognize paint documents.

QuickTime and the Power Macintosh Version of ClarisWorks (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Problem:

ClarisWorks recognizes that certain files are QuickTime movies, but it doesn't display the little filmstrip badge and won't play them. There is no movie info item in the Options menu.

Solution:
When using QuickTime movies in applications that have been optimized to run in "native" mode on the Power Macintosh, you must have the "QuickTime Power Plug" Extension in the System Folder, Extensions Folder. If you do not have this Extension in your Extensions folder, simply reinstall it from your Macintosh System disks.

It should be noted that a standard, as Installed, System for the Power Macintosh includes all this properly installed. The QuickTime Power Plug enabler is necessary for any native applications that want QuickTime support, but it is not necessary for non-native applications to use QuickTime.

Ruler Settings and Alignment Issues in the ClarisWorks Paint Environment (PT)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The AutoGrid in Claris Graphics Products is an invisible grid that aligns objects when created or moved with the Mouse. The Autogrid is modifiable. This means that you can turn it on or off as well as set the grid spacing.

The MacDraw, ClarisImpact and ClarisWorks Drawing environment grids are determined by the ruler settings. The maximum value that should be used is 72 divisions per inch, since this number represents the maximum resolution of a Macintosh Monitor and the minimum distance that object movement can be accomplished, which is 1 pixel or 1/72 of an inch.

The ClarisWorks Painting Environment represents an entirely different situation. Setting the divisions in the Rulers command has absolutely no effect on the grid spacing in the Paint Environment. This is because the Paint Environment is bit mapped, or pixel based instead of vector or object based. What does effect the grid spacing is the Grid Size command under Options.

The Grid Size can be set to 2,4,18,16 and 32 pixels. This also is represented as x/72 of an inch. When reduced these fractional measurements become 36th's 18thÕs or 9thÕs of an inch. Note that the selection of a grid size of 1 pixel is not offered as this is identical to turning off the Autogrid.

For this reason the Ruler Settings in the Paint environment default to 9 divisions per inch. The means that the large divisions on the ruler represent a third of an inch not a quarter as normally expected. Setting the ruler to the standard 8th's, 16th's, or 32nd's will make it impossible to align objects to the ruler in the Paint environment when using the mouse or keyboard to create or move objects.

In a mixed Draw/Paint environment Ruler Settings become an even more important consideration. The ruler settings are defaulted by the Drawing environment to 8 divisions per inch. In this situation it will be impossible to align Paint objects to Draw Objects aligned to the ruler with the mouse or keyboard unless the ruler is set by the user to non-standard values (9th's) or the Autogrid is turned off. It should be noted that a Draw environment can't be created in the Paint Environment so having a mixed environment naturally default to a ruler setting of 9th's never occurs. If this is desired, create a blank document and save it as a stationery document.

TIP: How to Make a 3-Column Document Fold Evenly Into a Brochure (WP,DR)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Scenario:
The starting point is a Word Processing or Report document in Landscape Orientation. A folded brochure/pamphlet of three columns is needed. The tricky part is how to get the brochure to fold evenly down the middle of the space between each column while retaining three equal width columns.

Solution:
It is possible to approach this brochure in two ways. EITHER determine the space between each column you desire and then set your left and right margins to half that amount, OR determine the margins first and then make the space between columns double the margins. For example, if you want 0.25" margins then set the space between columns to 0.5".

Exact steps on how to create a 3 Column Landscape brochure:
The following steps walk you through how to create a 3 column Word Processing or Report document in Landscape Orientation with 1/4" margins all the way around the document and 1/2" space between each column. These steps are best used with a PostScript LaserWriter and cover aspects specific to this type of printer. If you have a different type of printer then you may not be able to use such small margins. Check your printer manual for the minimum margins or the maximum printable area and base your margins on this information.

1. Create a new Word Processing or Report document.
2. Choose Page Setup from the File menu. Notice the section for Orientation and change the selection from the person standing up (Portrait) to the person laying on their side (Landscape). Also, click the Options button and check the option for Larger Print Area (Less Downloadable Fonts). Click the Okay button when you are done.
3. If you are in a ClarisWorks 1.0 or 2.x document, then choose Document from the Format menu and change all the margins to 0.25". Click the Okay button when you are done. If you are using a ClarisImpact Report then you will find the Document choice on the Layout menu.
4. Choose Columns from the Format menu and change the number of columns to 3. Also, change the space between columns to 0.5". Click the Okay button when you are done.

What to Do if Blank Fields Leave Blank Space in a Mail Merge Document (WP, DB)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When printing a ClarisWorks Mail Merge document, the program should automatically remove empty fields occurring in multiple address lines. If, for example, you place the fields on your mail merge document in this order:

Name
Address 1
Address 2
CityStateZip

And a record does not contain anything in Address 2, that record should print CityStateZip directly below Address 1 automatically.

If you don't find this to be true, the following is a method of dealing with the problem. It should be noted that this method should not be necessary under most circumstances:

Create the following field:
Full Address (Calculation, text result) =
IF(ISBLANK('Address2'), 'Address1', CONCAT('Address1', CHAR(13), 'Address2'))

This formula checks for a blank Address2 field and just outputs Address1 if Address2 is blank. If Address2 contains data, the calculation outputs Address1, a carriage return (CHAR(13) and the Address2 field. The Carriage Return will not function or display in the ClarisWorks DB layout, but it is there. It will function properly when doing the Mail Merge in the Word processor.

The field Full Address is used in the Mail Merge instead of Address1 and Address2.

Newsletter-Draw Sample: Line Spacing and Frame Links

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In the Sample Files folder installed with the ClarisWorks 2.1v3 software, the Newsletter-Draw sample displays oddly as follows:

1) The paragraphs on the left side of each page have huge line spacing. Clicking into these text frames would display "13pt" in the line spacing, but that is not correct.

To readjust the line spacing:
a) Double-click into the first column of text on page 1.
b) Choose Select All from the Edit menu.
c) Select Paragraph from the Format menu, and change the Line Spacing units to "Lines(li)" so that it reads "1 Lines (li).
d) Click OK, then do the same steps to the first column of page 2.

2) The second column on page 1 wraps around the chart object, but continues to wrap above the object. Follow the steps above to change the line spacing in this column to 1li.

3) Columns 1 and 2 on page 1 are not linked, so text will not flow from one to the other. This can be fixed as follows:

a) Double-click into column 2 of page 1.
b) Choose Select All from the Edit menu.
c) Choose Cut from the edit menu.

d) Select the pointer (arrow) tool.
e) You should now see selection handles (small black squares) around the empty second column. Press the delete key on your keyboard to remove the empty column (do not cut the column, or you will lose the text you took out of the column).
f) Double-click into the first column, then click at the end of the text in that column.
g) With your cursor at the end of column 1, press Return once to move to a new line.
h) Select Paste from the Edit menu. You should see an "x" appear in the bottom right corner of the column. The "x" indicates that text is flowing down beyond the column.
i) Select the pointer (arrow) tool.
j) You should see a black triangle pointing out of the bottom of the column. Click that arrow once.
k) Your cursor should now be an I-beam with a small line through the upper portion of the I-beam. Click and hold your mouse in the upper left position of the second column (you will need to guess where that will be, because there is nothing to indicate where the old column was).

l) Still holding the mouse button, drag you cursor to the lower right position of the second column. When you let go of the mouse button, the remainder of column 1 text should flow into column 2.

MacWrite Pro 1.5 vs. ClarisWorks 2.1

Here are a few things to consider if you are trying to decide between MacWrite Pro 1.5 and ClarisWorks 2.1 in meeting your word processing needs.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

ClarisWorks 2.1 integrated software offers word processing, drawing, painting, spreadsheet, database and communications capabilities. The strength of ClarisWorks is that it provides most of the tools you'll need in one application, making it quick and easy to add graphics to accent a document. It is an ideal application for PowerBook users since it offers the functionality of several programs in the size of just one.

MacWrite Pro, being a dedicated word processor, offers more powerful page layout and long-document features. While it lacks the graphic tools of ClarisWorks, it enables you to import a wider variety of graphic formats and integrate them into your documents in more flexible ways. You can create multiple sections to have different headers for each chapter, or create different numbers of columns on the same page.

Following is a list of MacWrite Pro features which the ClarisWorks 2.1 word processing environment does not offer:

Endnotes
Hide Pictures Command for speed
Merge Commands
Ability to merge to a new document

Ability to Left/Right Headers and Footers
Word Underline, Double Underline, Lowercase, Uppercase, and Small Caps styles
Larger Type (up to 500 pts vs. 255)
Find/Change character styles
Hyphenation Control
Spell as you type
Allows you to Save Selection only
Allows Page # of Total format
Option to turn off time/date updating
Page Breaks command when using Multi-Column Document
ADDit Modules
Text wrap-around irregular bitmap images
Fixed Frame Locations
Text and Sound Notes
Paragraph Style Sheets
32K Headers and Footers
Auto Save
Auto Backup
Graphic Cropping
Manual Tracking Control
Text Palette
Mouse controllable Page margins/ guides
Document Statistics
Sections
Multiple Headers and Footers
Custom character spacing.

ClarisDraw: ATM Error Codes Converting Text to Bezigons

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When using the text-to-bezigons feature you may encounter an error when converting a PostScript Type 1 font. The message will say that Adobe Type Manager (ATM) returned an error (id=xx), where xx is the error code. Here are the codes, and what they mean:

-1 [ATM_NO_VALID_FONT]:
Cannot find proper outline font. If you receive this error code, more than likely it is because you attempted to convert text in a style such as shadow, outline, bold, etc., when that PostScript font was not installed. You may have the plain style or other styles, but ATM can only convert styles when you have the exact PostScript version installed.

-2 [ATM_CANTHAPPEN]:
ATM had an internal error. You should probably reinstall Adobe Type Manager and the font in question, restart, and try converting again. If you still cannot convert text to bezigons, try to contact Adobe and see if they have any suggestions or ask Claris Technical Support for further help.

-4 [ATM_MEMORY]:
ATM ran out of memory while converting text to bezigons.

-6 [ATM_NOT_ON]:
ATM is installed but it is currently turned off. You should switch ATM on in the ATM Control Panel.

-9 [ATM_NO_CHAR]:
There is no Outline font for one of the characters in your text block. Wherever the conversion ended is the last character that successfully converted. You should try choosing Undo, changing the next character after the end of conversion to a different font, then try Convert to Bezigons again.

Can‘t Open Files Saved by Global Village Fax Center

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Global Village fax software can save received faxes in the following graphic file formats:

MacPaint (72 dpi)
PICT (72 dpi)
PICT (200 dpi)
PICT2 (72 dpi)
PICT2 (200 dpi)
TIFF (200 dpi)

Although Claris products which use the XTND translation system should be able to translate all these formats, in practice they can only translate the PICT2 files saved by the Global Village Fax Center application. Trying to open or insert any of the other formats will result in either a system hang (cursor stops spinning), an alert that the translator cannot read the file, or a blank document.

This seems to be due to a problem in the way Fax Center saves documents since other Macintosh applications also have problems translating these files.

So, to save a received fax in the Fax Center, choose Save As and select the PICT2 (72 dpi) or PICT2 (200 dpi) format. The 200 dpi resolution is higher quality, but imports as a very large image, so use 72 dpi option if you plan to print.

Finding Incompatible Extensions

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Following are the steps you can take once you've confirmed that an extension is causing a issue to actually find the incompatible extension.

If you have an Extension manager control panel, use that to disable all extensions and then enable a few at a time, Restarting after each group. In this way, you can work more quickly than one at a time.

If you don't have an Extension manager, use the following method:

FOR COMPUTERS RUNNING SYSTEM 7
1) Open the System folder. Choose New Folder from the File menu. Drag the resultant new folder to the Desktop. You will not need to rename the Untitled folder. A handy place to put it is right above the Trash.
2) Open the Extensions folder. Choose View by Kind from the View menu and make the window wide enough so that you can see the Kind column. Scroll until you see files of kind "system extension." Hold down the Shift key on the keyboard in order to select several files at once and click each system extension except for ones titled System Enabler. Once selected, you can drag them to the Untitled folder.

3) Choose Restart from the Special menu and see if the issue has been resolved. (If it hasn't, one of the files in the Control Panels folder or a system extension in the System folder itself may be the issue. Add them to the Untitled folder. Close the System folder and Restart again.
4) Select several files from the Untitled folder, write down their names, and drag them onto the System folder. They will go into the proper folder. Then Restart and see if the issue has returned.
5) Continue Step 4 until the issue returns. When it does, you know that the incompatible extension is in the last group of files you added. Continue to narrow down which one it is by removing files of that group one by one until the issue is resolved again.

FOR COMPUTERS RUNNING SYSTEM 6
Follow the same steps above, except for Steps 2 and 3. In their place, open the System folder, choose View by Kind from the View menu and select all files of type "startup document" or "control panel", and drag them to the Untitled folder.

SOLUTIONS

Make sure you have the latest versions of both the extension and the application. You should contact the publishers of the extension and the application to tell them about the incompatibility and to see if they have any suggestions.

(If you have a question, post it in the message boards. The boards are located in the product folders in the Technical Support folder.)

Finding Records with Blank Fields Without Using Match Records (DB)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

In a ClarisWorks database, it is possible to search for records that have an empty or blank field by using Match Records and the ISBLANK function. The only problem with this method is that you have to compose a formula and then hide the unselected records. This can be time consuming if you are in a rush.

Try this method for faster searching for records with blank fields:

1. Choose Find from the Layout menu or type Command-Shift-F.
2. Enter the following into the field you want to search for blanks:

<>'""

3. Check the Omit button.
(In ClarisWorks 2.1 or above, you can type an equal sign:
= and NOT click the Omit button)

4. Initiate the find by typing a Return or clicking the Find button.

An A/UX patch server was set up about 2 months ago in the A/UX Technical Response group that maintains the comp.unix.aux newsgroup.

The A/UX patch server is now available to the public using the Internet Address 130.43.6.2 and the domain host name aux.support.apple.com. It can be "ftp"ed with a login name "anonymous" and any password. The comp.unix.aux newsgroup archive is under the /usr/spool/ftp/pub directory.

ClarisDraw: Hiding Segments of a Polygon or Bezigon

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This hidden feature in ClarisDraw allows you to change polygon or bezigon segments to a transparent fill.

1. Create a polygon or bezigon (in this example a 5-pointed star).
2. Select the star with the Arrow tool.
3. Choose Reshape from the Arrange menu.
4. Click on the end or the beginning of the segment you want to hide.
5. Press the Caps Lock key down.
6. Command-Control-Shift-Click the other end of the segment.

To show a hidden segment just repeat the steps above. If you want to hide more than one segment at a time then change step 4 so that you are Shift-Clicking multiple segments.

Installation issues

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Issues During Installation

Most Claris applications come with an Installer which asks you to disable virus checking software before doing an installation. To temporarily disable virus checkers and other system extensions which may conflict with an installation, do the following and then try the installation again:

* Choose About this Macintosh or About the Finder from the Apple menu to find out what version of the Macintosh System you are running.

* For System 7, choose Restart from the Special menu and hold down the Shift key until you see the message "Welcome to Macintosh. Extensions Off."

* For System 6:
1) Open your system folder. Go under the File menu to 'New Folder.' Drag the resultant new folder to the Desktop. You will not need to rename the folder. A handy place to put it is right above the Trash.
2) Drag your System file and your Finder file from the System folder to the new folder.
3) Choose Restart from the Special menu.

Issues After Installation

Sometimes, after you install new software on your Macintosh computer, you experience an increased frequency of lockups, crashes, or system error messages. When this happens, you are forced to turn off the computer and restart the system. These kinds of errors are an inconvenience and can also cause you to lose work.

Most often, these issues are caused by files called Extensions or INITs that you have added to your System Folder. Use the same instructions as above to temporarily disable them. Refer to the System Crashes & Lockups article in this folder for detailed instructions on how to find out which extension is the issue.

Published Date: Feb 18, 2012

System Crashes & "Bugs"

The following article was taken from the Claris on-line technical library. Claris currently maintains on-line technical libraries on the following services: America Online, CompuServe and AppleLink.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

CRASH WHEN OPENING APPLICATION

If you launch your Claris application and experience a system error just after the Claris screen comes up, it's very likely that you have a corrupt font in your System. Open the System folder, then the Claris folder, and look for the Claris fonts file. Click it once to select it, choose Get Info from the File menu and lock the file. This will prevent all Claris applications that use the Claris Fonts document from scanning installed fonts during launch. If you can't find the Claris Fonts file or want more details on how to find corrupt fonts, read the Claris Fonts article in this folder. Claris Organizer does not use a Claris Font document, see below for troubleshooting.

OTHER CRASHES & ISSUES

Many software issues are caused by conflicts between applications and system extensions. These conflicts can cause crashes and unexplainable behavior. Extensions (known as INITs in System 6) are files that you place in your system folder which enhance the way your system works. If you have extensions, their icons will usually appear on screen as the computer is starting up.

The first step in troubleshooting system crashes or what appear to be bugs or incompatibilities is to disable extensions. The methods for doing this differ for System 6 and System 7, so if you don't know which version you're running, choose About this Macintosh or About the Finder from the Apple menu.

METHOD FOR COMPUTERS RUNNING SYSTEM 7

System 7 has a very handy method built right in for checking extension conflicts. If you restart the computer and hold down the shift key, files that affect the system on startup will be disabled. You should hold down the shift key until you see the message, 'Welcome to Macintosh. Extensions off.'

After that, check to see if the issue has been resolved.

METHOD FOR COMPUTERS RUNNING SYSTEM 6 OR EARLIER

In order to separate the System from the INITs, you have to place them in separate folders and restart the computer. Here are the steps:

1) Open the System Folder. Choose New Folder from the File menu. Drag the resultant new folder to the Desktop. You will not need to rename the folder. A handy place to put it is right above the Trash.

2) Drag the System file and Finder file from the System folder to the new folder.
3) Restart the computer.
4) Check to see if the issue has been resolved.

IF THE ISSUE IS RESOLVED

You've found an extension conflict. The key now is to find out which extension is incompatible. For instructions, refer to the article, Finding Incompatible Extensions, in this folder.

IF THE ISSUE STILL OCCURS

Only a few possibilities remain:

- Holding down the shift key on startup with System 7 doesn't always disable every extension. To be sure they are all disabled, follow the directions for System 6. If there is a system enabler in the Extensions folder, be sure to include that in the new folder you create.

- The Claris application is corrupt and needs to be reinstalled from the original diskettes.

- The System is corrupt. Restart your computer and insert the Disk Tools diskette to start up from the floppy. Open the System folder and throw the System and Finder files into the Trash. Rename the System folder "Old System." Then, Restart and insert the first System installer disk.

If the issue remains even after trying these things, post a message in the message board detailing your situation. The message boards are located in the product folders in the Technical Support area.

XTND Translation Issues

Troubleshoot XTND translation issues or errors systematically. Here are some techniques for handling XTND errors.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Claris applications are able to translate a variety of file formats using the Claris XTND System and Claris translators. These auxiliary files must be installed correctly to work. In addition, the Claris XTND System acts like an INIT or extension, and can conflict with other extensions.

If your Claris applications experience any of the following symptoms, it may be time to troubleshoot the XTND system:

* When choosing Open, Place File, Insert, Import or Save As from a Claris application, translators are not listed in the pop-up menu (MacDraw II, MacWrite II, TIFF, EPSF, etc).
* When opening a file in another format, you get the message "File not found."
* When you get error -43.
* When you use the Open command to try to translate a file, you don't see it in the Open dialog, although you can see it when you look in its folder in the Finder.
* When you are importing a graphic into FileMaker Pro and get an "out of memory" message. (In this case, skip directly to step #3 below.)

Solutions

Troubleshoot the issue systematically. The nature and severity of the XTND error determines what kind of solution is necessary. Below are six solutions you may try to trouble-shoot the issue. Each of the six solutions builds on the last, with the very last solution addressing the most severe system issue.

1. Verify that the translator files are installed properly.

There should be a Claris folder in the System folder. Within the Claris folder you need the Claris XTND System and Claris Translators folder (which holds all the individual translators). If you have ClarisWorks 1.0 you need an additional file called ClarisWorks Translators in the Claris folder. This file contains database and spreadsheet translators. If you have everything installed properly and the issue persists, go to step 2.

2. Check the System Folder and Claris application folder for duplicate copies of the Claris XTND System file and/or any translator files.

If multiple copies of the XTND System are found, delete them, then try to open or save a file. If you still can't open or save, go to step 3.

3. Quit the application, then delete the XTND Translator List file (System 6: in the Claris folder; System 7: in the Preferences folder).

Relaunch the application, choose Save As and see if the translators are listed. If the translators are not listed, go to step 4.

4. Check for a possible conflict with an INIT or extension.

Restart the computer with the shift key held down to turn off extensions in System 7. If you are using System 6, create a new folder on your hard drive, drag System, Finder and the Claris folder into it and restart the computer. Then, launch the application, choose Save As and see if the translators are listed; if not, then go to step 5.

5. Create a new folder on your hard drive at the same level as the System Folder (in the main hard drive window) [System 7 only].

Move everything, EXCEPT the Preferences Folder, from the System Folder to the Untitled Folder and restart your computer. If this solves the issue, then move any required preferences files (QuickMail, etc) from the old System Folder's Preferences Folder into the new Untitled Folder's Preferences Folder. Note: you will not be able to copy the Finder Preferences.

To clean up, after you've created the new System folder, throw away the old System Folder as well as the old Preferences Folder; then change the name of the Untitled Folder to "System Folder." If this still does not solve the issue, go on to step 6.

6. Rebuild the desktop (hold down the command and option keys while restarting the computer), then run Disk First Aid or Norton Disk Doctor.

Disk First Aid is included on your System disks. Instructions are included in your computer's owners manual.

"Insufficient Memory" Error Message During Installation

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you get the following error message when trying to install or run a Windows application from a floppy disk, "Insufficient memory to run this application; close one or more applications to increase available memory and try again," the likely issue is a bad floppy disk or an incorrect CMOS setup.

Despite the error message indicating a memory issue, you should first run CHKDSK on the floppy disks to check for media errors. In addition, Microsoft documents that an incorrect CMOS setup for the floppy drive will also create an insufficient memory error in Microsoft Knowledge Base+ article #Q86248. For example, you might have a 1.44MB drive configured as 720K.

Other error messages that Microsoft links to an incorrect floppy drive configuration are:

"Cannot find file <drive>:<filename> (or one of its components). Check to ensure the path and filename are correct and that all required libraries are available."

ClarisDraw: Dimensioning Autosize Line and Guideliner

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Although ClarisDraw does not have the ability to add dimensioning to an object like most CAD programs it is possible to have the line dimensioning feature simulate object dimensioning. This feature is called Autosize Line. Combined with the Guideliner feature it is possible to easily dimension an object. Follow the steps below as an example of how to dimension one side of a rectangle.

1. Choose Guideliner from the Layout menu so that there is a check mark next to it.
2. Draw a rectangle.
3. Select the Line tool and notice that when you move your mouse near the edges of the rectangle that ClarisDraw automatically locates the edge of the object by drawing a guideline on screen.
4. Once you have located an edge then hold down the Shift key and the Mouse button and drag to the opposite edge of the rectangle until the guideline for the opposite edge appears and then let go of the Mouse button and the Shift key.
5. While the line is still selected, choose Autosize Line and Arrows at Both Ends from the Line Style Controls menu/palette.
6. If necessary, move the line away from the object so it appears more like an object dimension.

Postscript Printers and WYSIWYG Performance - Questions And Answers

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Q. What does WYSIWYG mean?
A. WYSIWYG, an acronym for What You See Is What You Get, is a term referring to the representation on screen of what your page will look like when printed out. The printed page is represented on screen only approximately, since the available resolution in pixels or dots per inch on your monitor screen is much different than the available resolution on your printer. There are various techniques available that improve the approximation of a printed page on screen. One of the more influential pieces to WYSIWYG is font technology.

For instance, let's say you are setting up a layout in FileMaker Pro. You are printing to a postscript printer, you do not have ATM installed, and you are using the font called Helvetica from the Font selection on the Format menu.

The previous example would not give very good WYSIWYG results. Instead, you should select a TrueType font such as Arial instead of Helvetica. Helvetica, which is a printer font, won't have an accurate display on screen because Windows will substitute a different font for the text on screen. You should also edit and use the printer driver's substitution table. Otherwise you could get the Postscript version of Helvetica.

Having to choose a different font for better WYSIWYG behavior would seem to imply that FileMaker Pro is somehow compatible with some fonts and not others. That is partially true, for in fact not all fonts are created equal. TrueType fonts were designed for better WYSIWYG performance.

Q. When I Install A Postscript Printer, Aren't Fonts Installed?
A. Postscript Printers have a selection of fonts built into them, usually including the base 13 core fonts Helvetica, Times, Symbol, and Courier. Most Postscript printers come with a basic set of outline fonts permanently in ROM. After you install your printer driver, then fonts appear in your application font menus. Where do these fonts come from? The Printer driver has the font names and metrics hard coded into it. You do not have to install outline fonts to print, however, if you want to see what your printed documents will look like on screen, you do have to install the same versions of these fonts for the screen. If you don't install the screen version of an outline font, Windows substitutes the screen version of another font. For example if your printer contains the Palatino outline font and you don't install the screen version of Palatino Windows displays the Times-Roman screen font for Palatino. If you want to see what a document will look like on your printer you have to Install a screen versi
on of the font.

Q. Are Arial and Helvetica Identical?
A. These two fonts are not actually identical. Many characters differ only slightly between the two typefaces, but they do differ. For instance, the uppercase C has a downward "spur" in Helvetica, but not in Arial. The uppercase R has a curved "leg" in Helvetica, while the leg in Arial is diagonal. The finishing strokes of the lowercase a and numeral I differ between faces, and the percent sign is made up of perfect circles in one but ovals in the other.

If you format a document with a True Type font the Windows environment will automatically download the font to the laser printer, so what you see on the screen will be the same font as on the printed page. If you format a document with a printer-resident font that you have no screen font for, Windows uses a True Type screen font that most closely matches the selected printer font. The results will not be as WYSIWYG as if you had selected a Postscript font, but may be more WYSIWYG than without True Type technology. True Type fonts are not Postscript fonts. They may act differently, space differently, and appear differently. Typefaces based on different technologies can't be interchanged at will. You can mix them and match them, but be aware that a difference as small as one pixel can sometimes mean that a block of type will fit on a single line or that it will not.

Q. Will text perfectly match using the same font technology on screen and printer?
A. No, but almost, and certainly much better than it used to. Text can be several lines longer or shorter when printed to a higher resolution printer. Postscript Type 1 characters suffer from rounding errors. Each character in a Postscript typeface counts as a certain width on a line. A character at a small size, such as 10 pt., might be 7.5 pixels wide on a computer monitor. But because it is impossible for an application to give a character half a pixel, this character spacing is rounded up, giving the character a whole 8 pixels. Over the length of a line, these rounding errors can add up. When the document is printed on a Postscript printer of a different resolution, this character spacing rounds differently, which can result in different line breaks and a different layout for the whole job.

True Type tries to handle these rounding errors by giving applications more information about each character. An application can add up all the fractional pixel widths of each character on a line and then must round off only the pixel count at the end of each line, not the pixel count for each character. This theoretically results in True Type documents with a rounding error of only one pixel per line, instead of many. This however is enough to throw off the word wrap of a line also. A difference of a single pixel can mean that a word like "a" or "I" will fit at the end of one line instead of wrapping to the beginning of the next line.

Macintosh: Converting Vector Data to QuickDraw Data

How many vectors is the Display Card 8/24 GC capable of handling? I am interested in high-performance CAD. I assume that this number depends on whether or not the expansion kit is installed. Will you give me the data for both versions?

This article has been archived and is no longer updated by Apple.

The Macintosh, like most desktop computer systems today, is a raster-based image system -- not a vector-based system. Vector data can be entered, but needs to be converted to a line drawing system based on cartesian coordinates for displaying on the screen. Specifically, for the Macintosh, this means that the vector data needs to be converted into QuickDraw data and then drawn with QuickDraw routines.

If you want to create your own CAD program, you need to understand both the vector system and the QuickDraw system, as well as do the conversion between the two methods. Your implementation of your vector system will determine the number of vectors handled.

On the other hand, if you want to use a commercial application, the vector limits are a specification of that commercial application. The application also converts the vector information into QuickDraw information for screen display. However, some commercial developers have bypassed QuickDraw and written directly to the Macintosh hardware. In these instances, the applications do not benefit from the accelerated QuickDraw of the new Display Card 8/24 GC. These applications also have a higher probability of breaking on newer models of the Macintosh.

The speed at which vectors are handled (as vectors) depends on the application's implementation and the speed of the CPU on which that application is run. The faster the CPU, the faster the application. The speed of the conversion from vectors to QuickDraw is also application- and CPU speed-dependent. The speed with which QuickDraw is handled is a function of the Display Card 8/24 GC and the CPU speed.

Expanding the memory of the Display Card 8/24 GC allows a larger off-screen bitmapped image to be stored directly on the video card. This speeds up the movement of images larger than the screen as they move on to and off of the screen. The expanded memory acts a holding space for the off-screen bitmapped image.

Segment Load Failure Errors in Windows

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If the error message "Segment Load Failure" appears during installation, the likely cause is that the Files= setting in the CONFIG.SYS file is set too low. You should edit the CONFIG.SYS file and change the number after the Files= line to a higher value.

"Segment Load Failure" errors are generated if a discarded code segment has been damaged or moved, or if Windows lacks the system resources to load a file, as in the case when there are not enough MS-DOS file handles.

Microsoft Windows loads programs into memory in segments (64K blocks of memory) marked fixed, movable, or discardable. Windows can unload discardable segments when it needs more memory for other applications. When an application needs to access a segment of code that is not in memory, Windows loads it from the hard disk. If Windows cannot load the segment for some reason, it generates a "Segment Load Failure" error.

If You Are Running Windows for Workgroups 3.11:
When you try to open or copy a file larger than 2 megabytes (MB) with Windows for Workgroups 3.11, you may receive one of the following error messages: "Segment Load Failure" or "Insufficient Memory."

These errors occur if both of the following conditions exist:

- You are using a permanent swap file without 32-bit disk access enabled. This causes paging to occur through MS-DOS.
-and-
- You are using 32-bit file access. Since 32-bit disk access is disabled, the real-mode mapper (RMM.D32) is used to provide 32-bit file services.

These errors do not occur if the permanent swap file is on a drive with 32-bit disk access enabled or if 32-bit file access is disabled.

To work around these errors do one of the following:

- If your hard disk controller is WD1003 compatible, enable 32-bit disk access, or disable 32-bit file access.

Microsoft has confirmed this to be a issue in Microsoft Windows for Workgroups version 3.11.

This size of the file needed to trigger this error is not always 2 MB. The limit is 512 multiplied by the size of the allocation unit for the drive where the target file resides. The allocation unit size is commonly 4096 bytes, thus the apparent 2 MB limit. In cases in which the allocation unit size is different, the limit is also different.

Some Tips on Printing Envelopes with a StyleWriter or StyleWriter II from ClarisWorks

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Here are some tips for printing envelopes to an Apple StyleWriter II printer:
1. Set the paper size in Page Setup... to #10 Envelope
2. Make certain the orientation icon is set to portrait (upright)
3. Choose Document from the Format menu to set the margin settings to:
Top Bottom Left Right
.29 .29 .75 .75

The two types of StyleWriters actually feed envelopes differently so it does make a difference which printer you have.

1. The StyleWriter has a slot in the back where envelopes are fed in, top first, one at a time.

2. The StyleWriter II has an adjustable feeder tray which protrudes from the top where envelopes are fed. There is a lever on the right hand side which you must switch to envelope.

Putting the envelopes in the right place is only half as important as placing them in at the right TIME. The StyleWriter will try to eject the first envelope it senses sitting the in feeder. The trick is to issue the Print command; wait for it to complain that the printer is out of paper; THEN place the envelope in the feeder (up side down) and click the Continue button or press return. This way the envelope will not be ejected until it has been addressed.

Decimal Tab Does Not Align Numbers Properly When Printing to a Hewlett Packard DeskWriter

This issue is particularly common when some data has been underlined.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If the decimal tabs are not aligning even though the screen looks OK and all techniques have been followed for aligning decimal tabs, you might need to look at whether you are using an Hewlett Packard Deskwriter. If so, make sure their HP Fonts are installed in the correct folder in the system folder. (The HP Fonts belong in the HP Folder in the Preferences folder. Restart and rebuild desktop and all should be well.)

This issue is especially pronounced when aligning three decimal tabs underneath each other with the middle section underlined. Hewlett Packard tech support says printing with True Type Fonts does not perform well when underlining is used.

Inserting or Opening PICT, EPSF or GIF Files with ClarisWorks on a Performa

Inserting or Opening PICT, EPSF or GIF Files with ClarisWorks on a Performa may result in the appearance of strange or garbage characters.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Opening or inserting files that are in PICT, EPSF or GIF format may result in the appearance of garbage text on a Performa. To avoid this, select Control Panels from your Apple menu at the left-hand side of your menu bar next to the File menu. Open the Performa control panel. Deselect the options, system protection and application protection. Now insert or open the file again. The correct translator should now be able to convert the file successfully.

This control panel conflicts with the Claris XTND system and translators' ability to accurately convert the file formats.

Can‘t Print Multiple Copies in ClarisWorks

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks may only print one copy of a document, even if you specify multiple copies in the Print dialog box. In the case of the Canon BJC600 driver version 2.0c, switching from color to black-and-white only printing allows you to print multiple copies. Microsoft Write, which ships with Windows, prints multiple copies fine.

Microsoft reports a similar problem with Excel 5.0 and the Hewlett Packard DeskJet 500C and 550C driver versions 3.0 and 3.1.

GS/OS: How To Identify Version Numbers

Could you tell me if there is an easy way to determine the version of GS/OS installed on different systems?

I looked in "About the Finder", and the Control Panel DA, and I did "Get Info" on several files the in System file, but none gave me the information I need.
This article has been archived and is no longer updated by Apple.
To find the version of GS/OS and associated files installed on a particular disk, hold the space bar down during startup. This presents a text screen with the version numbers displayed.

The version number displayed at the top center of this screen correlates as follows:

On-Screen Version #	Date	GS/OS Version (as Labeled on Disk)
4.0	Aug 18 88	GS/OS 4.0
3.00 (or lower)	May 30 89	GS/OS 5.0
3.02	Dec 15 89	GS/OS 5.0.2
3.03	Aug 20 90	GS/OS 5.0.4
4.01	Mar 04 92	GS/OS 6.0

- On-screen version numbers lower than 3.00 indicate GS/OS 4.0

- ProDOS 16 displays a startup screen with "PRODOS 16" on it

- System Disk 3.2 indicates ProDOS 16 v1.6

- System Disk 3.1 indicates ProDOS 16 v1.3.

ClarisWorks for Windows Install Fails Under OS/2

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

OS/2 can be installed on a system that already has DOS installed or can be installed as the only operating system. If you install ClarisWorks for Windows on a system that only has OS/2 installed (and did not already have DOS installed) at 98% done you will get the error message "Could not open the file named: C:\\DOS\\DOSHELP.HLP". This file exists under DOS but not under OS/2.

What the installation was doing at this point was creating the Program Manager group and the ClarisWorks icon and the CLARIS.INI. You will need to manually create the ClarisWorks icon in Program Manager by using File-New-Program Item and setting the command line to 'C:\\CLWORKS\\CLWORKS.EXE', assuming you installed ClarisWorks in the default C:\\CLWORKS directory. When you run ClarisWorks for the first time it will ask for your User Name, Company Name, and Registration Number.

Home Pack Template Does Not Print All Records When Printing To An ImageWriter II

This is only a issue when printing to an Apple ImageWriter II.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The ClarisWorks Stationery template called Names and Addresses (DB) may not print as expected to the ImageWriter II printer. This template is part of a collection of templates that are included in the ClarisWorks Home Pack. You can find this particular file in the folder provided called Correspondence. Two of the layouts included in the Names and Addresses template are for specific paper sizes and specific types of printers.

The layout named, "Daytimer" was not designed for use with computer paper and an Apple ImageWriter II printer. When printing from this layout to an ImageWriter II with the Page Setup paper size set for Computer Paper, only the first two columns will print, preventing perhaps several records from being printed. If the desired output is to print all three columns, but not necessarily for use with a Daytimer, then change the Orientation (see Page Setup) to landscape (or wide).

The layout named, "Avery 5160" was not designed for use with computer paper and an Apple ImageWriter II printer either. In order to print mailing labels with computer paper and the ImageWriter II printer, you must have label printer paper that is specifically designed for tractor fed printers, such as Avery labels number 4022, 4065, 4143, and several other 4000-series labels from Avery.

How to Exclude the Lowest Number in a ClarisWorks Spreadsheet

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
How do I get a SUM function in a ClarisWorks spreadsheet to exclude the lowest number in a range of numbers from the total and we don't know which cell it will be in?

Answer: After creating the SUM formula,

1) Precede the lowest number with an option space character

OR (even better)

use =SUM(C1..C20)-MIN(C1..C20).

ClarisDraw: How to Move a Paint Image Down and Right

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
How to move a paint image down and to the right using Origin.

1) Display the Graphic Ruler and change the Zero point. The origin values are Points or Pixel values.
2) Set both Horizontal and Vertical Ruler zero points at the bottom right corner of the paint frame.
3)Select the image in the paint frame and then change the origin values.

How to Open a Particular ClarisWorks File when Launching the Application

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In Program Manager, under File, choose Program Item (this is referring to icons). In the Description section, type whatever description you wish. In the Command Line, type the EXACT location of the file (i.e. which directory it is located in) along with the file name EXACTLY as it appears in File Manager. For example, a ClarisWorks file called "Billings.cwk" that is in the "CWORKS" directly on your C drive will have an icon with these properties:

Description: My billing file
Command line: C:\\CWORKS\\Billings.cwk
Working directory: C:\\CWORKS

To select an icon, you then proceed to click on the "change icon" button and select an icon.

How to Tell if ClarisWorks Help is in English or French

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
To make sure your version of ClarisWorks French has the help in French, check the CLWORKS.HL_ file date (or clworks.hlp stuffed name) on the disk. It must be August 25,1993. June 3rd 1993 has help in English.
These two versions have the same version number (v1).

Missing or Duplicated Lines of Text (WP)

Sometimes, this occurs when a word processing document that was created on one computer is opened on another computer.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

In ClarisWorks word processing documents, lines of text at the bottom of a page may seem to have disappeared; or to have been duplicated, appearing at the bottom of the page and again at the top of the following page. This occurs, sometimes, when a word processing document that was created on one computer is opened on another computer. This is the result of ClarisWorks incorrectly determining the flow of text from one page to another. It can be corrected by procedures which cause the document to be repaginated. The quickest of these is to simply click on the menu bar icon to change line spacing and immediately change it back to the original setting.

No Blinking Cursor in a Word Processing Document

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When using ClarisWorks on a CompUSA CompuDyne system, you may notice that when you open the word processor you cannot see a blinking cursor. This issue has also been reported on a Compaq Prolinea MT 4/66. You will still be able to type normally, but editing your documents later may be difficult. This is a reported issue with the CompUSA preinstalled video driver (CLGD5426/5428).

To correct the issue, complete the following steps:

1) Exit ClarisWorks completely.
2) Go to the Main window in Windows.
3) Double-Click on the Windows Setup icon.
4) Select Change System Settings from the Options menu.
5) Click on the down arrow to the right of the Display driver that is listed.
6) Scroll down the list of installed drivers and click on VGA (the one that says only VGA).
7) Click OK. (The System may tell you that the driver is currently installed and ask if you wish to use the currently installed driver or an update driver from another source).
8) Click on the Current button.

After you've chosen the driver, you must restart Windows so that the change takes effect.

After the change, ClarisWorks will display the cursor blinking properly.

Issues Printing to Certain Canon Printers

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When printing ClarisWorks documents to the following Canon printers, the following issues may be encountered:

Canon LBP 430 :

When using this printer with the 1MB memory which comes built-in, you will get an error when printing large documents (300KB or bigger in file manager) because the printer needs more memory. Upgrading the printer memory to 5MB will eliminate any issues with printing large and small ClarisWorks documents. Canon technical support is aware of this issue and has told Claris Software Quality Assurance that more memory is needed to print documents larger than 300K.

Canon BJ 600c:

When printing large pictures in ClarisWorks documents with the printer option "Screen Matched Color" selected in Print Setup, there may be some white lines going across the graphic.
To correct this issue, set the color option in the Print Setup dialog to "Print Color" from the combo box, instead of the default "Screen Matched Color".

A rotated transparent text frame with a white background will sometimes print with a light grid pattern as the background color. To correct this issue, fill the frame with white color before rotating.

Transferring Apple II AppleWorks data to ClarisWorks for Windows

I am getting rid of my Apple II and getting an IBM compatible running Windows and I am interested in using ClarisWorks for Windows but I have a lot of data in AppleWorks that I would like to use. What am I to do?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
'Cross-Works Apple II <> IBM PC File Exchange Utility' by SoftSpoken Inc. to the rescue. This utility will allow you to transfer your Apple II AppleWorks data to a IBM PC compatible by using the serial port of both computers, and will convert the information at the same time to a popular IBM application format that could be used in ClarisWorks, below is a partial list of it conversions:

AppleWorks Word Processor to Generic Word Processor
AppleWorks Spreadsheet to Lotus 1-2-3 v2.01
AppleWorks Data Base to dBASE III, III+, IV

The Generic Word Processor, Lotus, and dBASE data could then be brought into ClarisWorks for Windows and used.

(Cross-Works can translate from AppleWorks Word Processor to WordPerfect v4.2 documents; however, the WordPerfect translator in ClarisWorks requires WordPerfect v5.1 documents).

Ungroup Windows Metafile (*.wmf) Loses Color in ClarisWorks for Macintosh

Bringing a file from ClarisWorks 1.0 for WIndows loses color in ClarisWorks for Macintosh when saving a Windows Metafile (*.wmf) as a graphics document (*.cwk).

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
After running through DOS to Macintosh conversion and opening in ClarisWorks for the Macintosh the picture comes across as one grouped picture. If you ungroup this picture the color tends to be lost on 90% of the picture.

Work around: Before saving the document in Windows ungroup the entire picture and then save. When converted and opened in ClarisWorks for the Macintosh the picture will open ungrouped. The graphic can then be altered or grouped without any color loss.

Windows Missing Rulers and Screen Items

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If a customer does not have a ruler on the screen, no typing appears, there is a thick line on the left hand screen, no margins, and no cursor but the mouse moves and old files seem "intact", try the following:

1) Change the video driver to VGA

2) See if they are using HM520 printer driver as default. If so, change the driver default. As long as the HP520 is not the default printer, this problem won't occur.

"Unable to Quit..." Error Message

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When using ClarisWorks for Windows, you may sometimes receive the error message: "Unable to quit at this time. Please close all dialogs before quitting Windows." You may get this message even though there are no dialogs open. This can occur when trying to close a floating palette or a document, or when trying to exit out of ClarisWorks.

This is the result of an incompatibility between ClarisWorks and certain video drivers. It has been confirmed in the case of certain SpeedStarPRO video drivers.

Though this issue may be intermittent, the only way to consistently avoid it is to use another video driver. The most stable video driver is the VGA driver that ships with Microsoft Windows.

To change your video driver:

1. Open the Main group in Program Manager
2. Double-click on the Windows Setup icon
3. Choose Change System Settings from the Options menu
4. Click on the down arrow to the right of your current Display listing, scroll down the list of drivers and select VGA.*
5. Click the OK button
6. If the driver is already on your hard drive (which is usually the case), you will see a dialog saying: "A driver for this display is already on the system. Do you want to use the currently installed driver or install a new driver? When you see this message, click the Current button. If the driver is not already on your hard drive, you will be prompted to install it from your Windows diskettes.

7. Once you have chosen the VGA driver, you will see a dialog saying: "You need to restart Windows so that the changes you made will take effect. Do not press CTRL+ALT+DEL to restart Windows -- This will result in data loss. Restart Windows now?" When you see this message, click the Restart Windows button.

*If the VGA driver proves unacceptable, try using another driver within the driver family you were originally using, but select one that is either lower resolution and/or supports fewer colors than your original driver.

Tips To Increase Printing Speed In Windows

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Here are three quick tips to speed up printing in Windows:

1. Set Fast Printing Direct to Port Printing
2. Set TEMP to a RAM Drive
3. Set Stacks=0,0

Here's how:
1. Fast Printing Direct To Port
In the Windows control panel under printers, highlight your printer and click connect. Check fast printing direct to port. Unselecting it you will bypass the Windows Comm driver and will print through DOS, as if you were printing to LPT1.DOS.

2. Directing temporary swap files to a RAM drive
Setting TEMP to a RAM Drive Printing speed is partly determined by the speed of the drive in which the Temp file is located. Many applications send data to the printer from a temporary file on the hard drive. Therefore, the temporary file can send its data only as fast as the hard drive can transfer data. By putting the temporary file in a RAM drive, the data transfer speed increases making printing faster. Depending on how your network is set up, printing may be fastest with just a RAM drive, just a print spooler, or both. You will need to experiment to find the combination that works best for you. If you run a shared copy of Windows and want to put your temporary files on a RAM drive, place the RAM drive on the server, not the workstation.

3. Changing The DOS Stacks setting
Setting Stacks=0,0 MS-DOS reserves some storage space -- a stack -- for interrupt-handling code for hardware interrupts. Under MS-DOS 5.0 there are nine default stacks, each 128 bytes in size. This memory space is usually empty, waiting to hold interrupt code if there is a hardware interrupt. Multiple stacks slow down the system. Stacks decrease execution speed not only because they take up memory, but also because they spend time swapping interrupt code into and out of memory each time they're used. The STACKS command, which sets the number of stacks and their size, can also disable the stacks altogether. In the CONFIG.SYS file, specify:

Stacks=0,0

This setting forces interrupts to be handled by whatever stack happens to be loaded when the interrupt occurs. Removing the MS-DOS stacks forces MS-DOS-based applications to provide their own stacks; those that do not can cause stack overflows. Verify that your MS-DOS-based applications are don't need this before removing all stacks.

ClarisDraw: Changes Between MacDraw Pro and ClarisDraw

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
New features that ClarisDraw offers over MacDraw Pro:

Drawing Tools
- Shapes palette (16 new shapes)
- Regular polygon
- Straight connector
- Angled connector

Text Handling
- Faster editing
- Linked text blocks
- Text on a path
- Text wrap
- Condense option
- Extend option
- Floating text styles palette
- Outlining

Painting/Image Editing (complete list of features)
- Spray can
- Pencil
- Brush tool
- Marquee selection
- Lasso
- Eraser
- Paint eyedropper
- Wand
- Contrast
- Brightness
- Perspective
- Shear
- Distort
- Tint
- Image size and resolution options

Intelligent Features
- Smart Shadow
- Smart Embossing
- Smart Align
- Smart Size
- Replace Clones
- Smart Gradients (gradients that rotate with objects)

Precision
- Guideliner
- PointGuide
- Show Size palette (includes object placement, size, rotation and number of vertices)

General
- Create bezigons from circles, ovals, rectangles, rounded rectangles and arcs
- Text edit without ungrouping
- Presentation effects (including automatic loop, background options, advance, fit to window, center on screen, presentation cursor)
- New slide layer access popup menu
- Drawing document page size control
- Cross platform transparency (upon release of the Windows version in late 1994 or 1995)
- Drag and drop library
- Clip art library - 12 libraries, 2,400 elements
- CGM File Import/Export

MacDraw Pro features not included with ClarisDraw:

- Extensive, professional-level color editing within a palette
- 24-bit color in drawing mode. ClarisDraw supports this in Paint mode
- Pantone palettes
- Savable patterns palette
- Text Greeking
- Small Caps text style
- Text Kerning by pairs
- Two color patterns
- Customizable Font and Pen size menus
- Mouse selection sensitivity (High-Medium-Low)

Published Date: Feb 18, 2012

ClarisDraw: What It Lacks with Respect to MacDraw Pro:

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
- Color editing/manipulations. MacDraw Pro could edit colors from any color palette based on RGB (Red/Green/Blue), HSL (Hue/Saturation/Lightness), CMYK (Cyan/Magenta/Yellow/Black), color range, cooler colors, warmer colors, lighter colors, darker colors, blending, and more. For an excellent overview of what these terms mean and color use in general, please see the MacDraw Pro Color Guide.

ClarisDraw can only edit colors within the 256 color palette. It uses the Apple Color Wheel, which only allows numeric color editing using RGB and HSL.

- 24-bit color. ClarisDraw supports this only in Paint mode. MacDraw Pro also included Pantone[a] palettes ?? ClarisDraw does not.

Color Lookup Table (CLUT) import of non-native files

- Image Colors Feature (ability to create a new color palette consisting of the colors in the selected image)

- Savable patterns palette

- More than 64 gradients, 62 patterns, or 256 colors in a palette. MacDraw Pro could also have FEWER colors in a palette. With ClarisDraw, it's a fixed number only: 81, 168 or 256 colors

[Note: 24-bit color, or a total of 16 million colors, are available in any document when importing a bitmapped file. The 256-color limit in a palette doesn't mean that only 256 colors are available for an image - it simply means that 256 colors are the limit within the color palette. We chose the 256 most commonly used colors for the palette; you can add/delete colors so the palette better suits your needs.]

- View palette items by Name (except library palette)

- Spell Checking Options (spell check as you type, flash menu bar instead of beep, etc.)

- Text Greeking

- Small Caps text style

- Text Kerning by pairs

- Reshaping during creation of polygons and bezigons

- Two color patterns

- User definable Favorites Bar

- Keyboard shortcuts displayed in dialogs when you hold down the Command key

- Customizable Font and Pen size menus

- Mouse Selection Sensitivity (High-Medium-Low)
Published Date: Feb 18, 2012

ClarisDraw: Clones Sometimes Disappear from Layers

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In ClarisDraw 1.0, placing a clone on an upper layer, selecting an object from a lower layer, then Undoing "Use Library" results in both the clone and selected object disappearing.

To reproduce:

1. Launch ClarisDraw.
2. Draw an object on Layer 1.
3. Create a New Layer.
4. Open any library, then drag a clone from it on Layer 2.
5. Option-click on the object from Layer 1 to select it.
6. Undo Use Library.

Notice that both clone and the selected object have disappeared. Choosing "Redo Use Library" brings both back.
Published Date: Feb 18, 2012

ClarisDraw: Color and Gradient "Open"/"Save" Dialog Boxes Grayed Out

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisDraw ships with a number of specialized 256-color palettes. These palettes can be opened from the "Colors and Gradients" dialog from the LAYOUT menu. You can also use this dialog box to save palettes that you've modified.

However, neither the "Open" nor the "Save" buttons will be available unless you currently have the 256-color palette selected.
Published Date: Feb 18, 2012

ClarisDraw: Color Lost when Ungrouping Text Saved as PICT

In ClarisDraw 1.0 software, text saved as PICT then reopened looks fine, but ungrouping it causes the text color to change on the display and printed output.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In ClarisDraw 1.0 software, text saved as PICT then reopened looks fine, but ungrouping it causes the text color to change on the display and printed output. This happens with any palette other than the 81 or standard 256 color palettes (note that ClarisDraw uses the 168-color palette by default).

To see this occur follow the :

1. Launch ClarisDraw.
2. Draw a cylinder about 2.5" by 3".
3. Type a line of 36 point text, make the text purple, use the Palatino font.
4. Select all and choose Bind Text to Object.
5. Save as PICT.
6. Open the PICT. (Notice the color looks correct.)
7. Print (to compare) to a color LaserWriter printer and a color QuickDraw printer, such as a color DeskWriter.
8. Ungroup the PICT.

Notice the text color has changed dramatically. The work around is to change the pallette to either an 81 color pallette or a 256 color pallette. This can be accomplished by going to the Layout menu and choosing Colors and Gradients, and then selecting one of the other pallettes. The Claris graphics development team is aware of the issue.

Crash After Choosing "Revert to Saved"

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In ClarisDraw 1.0, when you have a default document open, then choose ÒRevert to SavedÓ in another document that has a Custom Color Palette loaded and open, your machine will get a bus error.

To reproduce:

1. Launch ClarisDraw
2. Create a new document
3. Open the Colors and Gradients dialog. Click 256 colors, then click ÒOpenÓ and load one of the extra Color Palettes that ship with ClarisDraw
4. Create a rectangle, tear off the Fill Color palette, and fill the rectangle with a color.
5. Create a paint frame.
6. Save the document, move the rectangle, and then choose ÒRevert to SavedÓ from the FILE menu.

Your machine will crash.

The Claris graphics development team is aware of this issue.
Published Date: Feb 18, 2012

Crashing When Opening a ClarisImpact Library (PowerMacintosh Only)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisDraw 1.0 may crash when you open a ClarisImpact Library with a rotated Bar Chart, Table or Timeline.

To reproduce:

1.Launch ClarisImpact 1.0v3.
2.Create a new library, add a custom rotated Bar Chart (or Timeline or Table), Save.
3.Launch ClarisDraw (PowerMacintosh version).
4.Open the saved Library.

The machine will crash. Note: Libraries with other rotated objects, like Calendar and Outline, work fine. This problem does not occur with the 680X0 version of ClarisDraw.

The Claris graphics development team is aware of the issue.
Published Date: Feb 18, 2012

Crashing When Opening MacDraw Pro Libraries in ClarisDraw

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This problem is fixed in ClarisDraw 1.0v2.

With ClarisDraw 1.0v1, if you try to open a MacDraw Pro library as a regular document, when no document window is open in ClarisDraw, your machine will crash.

To reproduce:

1. Launch ClarisDraw.
2. Close the new document (if any).
3. Open any MacDraw Pro library via the open dialog (open it as if it were a regular document - not a library).

The library will open, and your machine will hang.
Published Date: Feb 18, 2012

Macintosh: Serial Port Data Transmission Rate Limit

The SerReset function only lets me set the serial port speed to 57,600 baud. How can I set the serial port to support 203.4Kb?

This article has been archived and is no longer updated by Apple.
The maximum nominal data transmission rate that you can select through the Macintosh Toolbox is 57,600 baud. This is the maximum rate that the Macintosh II computer can maintain for transmission of serial data, when the SCC port is operating in an asynchronous, interrupt-driven fashion, timed by the 3.672-MHz clock.

AppleTalk operates at a nominal data transmission rate of 230.4Kb. This higher rate is possible because AppleTalk communications are not interrupt-driven. During AppleTalk communications, the AppleTalk Driver has complete control of the computer. Although AppleTalk uses a synchronous communication protocol, the AppleTalk Driver runs the SCC chip in asynchronous mode, timed by the 3.672-MHz clock.

The maximum possible transmission rate for serial data ranges from approximately 500 Kbaud on the earlier Macintosh computers and the Macintosh Classic to 900 Kbaud on the modular Macintosh II family. To achieve such data transmission rates, the SCC would have to be operated in synchronous mode timed by an external clock, and the serial driver would have to have complete, uninterrupted control of the computer.

The transmit-data and receive-data lines of the Macintosh II serial interface conform to the EIA standard RS-422, which differs from the more commonly used RS-232-C standard in that, whereas an RS-232-C transmitter modulates a signal with respect to a common ground, an RS-422 transmitter modulates the signal against an inverted copy of the same signal (to generate a differential signal).

The RS-232-C receiver senses whether the received signal is sufficiently negative with respect to ground to be a logical 1. The RS-422 receiver, on the other hand, senses which line is more negative than the other. An RS-422 signal is, therefore, more immune to noise and interference and degrades less over a distance than an RS-232-C signal.

If you ground the positive side of each RS-422 receiver and leave the positive side of each transmitter unconnected, you've converted to EIA standard RS-423. You can use this to communicate with most RS-232-C devices over distances up to approximately 50 feet.

Editing Gradient Colors in Paint Mode DoesnÕt Work Correctly

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In ClarisDraw 1.0, when working with a paint frame that has a color depth of thousands or millions of colors, if you try to edit the colors in a gradient you will get unpredictable results.

To reproduce:

1. Launch ClarisDraw. You must begin with the 168-color palette as default
2. Draw a paint frame. Change the paint frame setting to "Thousands" in the Resolution and Depth dialog box.
3. Tear off the gradient palette.
4. Double-click a gradient.
5. Edit the colors.

You will see that, as you choose different colors, the gradient doesn't always use the correct ones.

The Claris graphics development team is aware of this issue.
Published Date: Feb 18, 2012

Editing Palette Colors DoesnÕt Work Properly

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In ClarisDraw 1.0, if you try to edit colors in paint mode with the paint frame set to a color depth of thousands or millions of colors, you will see the wrong color in the editor. It also corrupts the 168-color palette after exiting paint mode (colors show up as black).

To reproduce:

1. Launch ClarisDraw.
2. Create a paint frame and tear off the fill color palette.
3. Select Resolution & Depth, select thousands or millions, and click OK.
4. Double-click a color in the middle of the palette.

Notice the color previewed is not the color you double-clicked.

5. Change its hue and brightness dramatically. Click OK.
6. Press Enter to exit paint mode.

Notice the color palette is corrupted and shows 256 colors even though the palette should still be the default 168.

The Claris graphics development team is aware of the issue.

Flipped Text Does Not Export to MacDraw Pro Correctly

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In ClarisDraw 1.0, saving flipped text to MacDraw Pro format will cause flip information to be lost in the saved MacDraw Pro file. Horizontal text will become unflipped, while vertical is rotated by 180 degrees.

To reproduce:

1. Launch ClarisDraw.
2. Set font size to 24 point.
3. Create a text object: "This is some text."
4. Duplicate text object twice.
5. Flip horizontal one of the duplicates, flip vertical the other duplicate.
6. Save as MacDraw Pro.
7. Either open the file in MacDraw Pro, or open it back into ClarisDraw.

You will see that the horizontally flipped object has lost its flip, and the vertically flipped object is rotated 180 degrees.

Gradient Palette Not Updated (PowerMacintosh Only)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
With the PowerMacintosh version of ClarisDraw 1.0, when a gradient palette file is left open in one document, the gradient palette is not updated if opened simultaneously in another document.

To reproduce:

1. Launch ClarisDraw
2. Tear off the gradient palette, and leave it near the bottom of the screen
3. Draw a rectangle and fill it with a spectrum gradient
4. Double-click the eyedropper and click on the object
5. Click each gradient in the top row of the palette (applying this gradient to each)
6. Save the palette
7. Open a new document
8. Open the saved gradient palette.

Notice the open palette isn't updated, unless it's under the Open dialog. Collapsing and uncollapsing refreshes it.

How To Determine Where Text Binding Starts

Determining the position where bound text will begin to wrap around an object.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
In ClarisDraw 1.0, the "Bind Text Options" dialog box contains a setting for choosing the origin point at which text will begin binding to that object. This setting is referred to as the "Starting Point - percentage along path," and is a value in the range 0 through 100 percent. Settings of zero and 100 are equivalent.

So what is zero percent and what is 100 percent? How does ClarisDraw use these values to determine where text will begin binding on any particular object? The answer is, it depends on the object.

Assuming you have the Starting Point set to zero, and "outside path" selected, the text starts:

* Line: at the place you began drawing the line, flowing in the direction you drew the line.
* Rectangle: upper left corner
* Oval: the "nine o'clock" position (Figure 3).
* Arc: think of the arc as a portion of a clock face. Using that analogy, the starting point will be the counter-clockwise-most point on the arc
* Polygon: if drawn clockwise, the starting point will be the first point that is drawn. If drawn counterclockwise, the starting point will also be the first point drawn, but the text will flow inside the polygon. This is because of the way Apple's QuickDraw routines define objects. A good rule of thumb is: the text will flow in the same direction in which you drew the polygon.
* Regular polygon: depends on the number of sides of the regular polygon being drawn. If the regular polygon has an odd number of sides, the starting point is the top of the polygon; if it has an even number of sides, then the starting point of bound text is the "three o'clock" position.
* Bezigon: same as for polygons
* Shapes palette: depends on the shape being drawn. Generally, the starting point is either the "nine o'clock" position, or the upper left of the object.

You cannot bind text to connectors, though you could create a polygon that follows the connector path and bind text to that object.

The above starting points also hold true if "inside path" is selected, except that the text is bound to the inside of the object, and flows in the opposite direction (as it must: the bottom of the text is always the portion that is bound to the object). The exceptions to this are the polygon and Bezigon tools, as noted in their descriptions.

Layers Versus Slides

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In ClarisDraw, layers and slides are different names for what is essentially the same thing.

When creating a drawing, layers can be used in a way very similar to clear plastic overlays in a book or drawing. There is the bottom layer, which is always opaque and which all the other layers build on. Subsequent layers sit "on top" of the bottom layer; they can be set to be either transparent, so all layers beneath show through, or opaque, so lower layers are concealed. Layers can also be hidden, so that their contents can be concealed until needed. Finally, layers can (and should) be renamed; by default, ClarisDraw gives new layers the sequential names "Layer 1, Layer 2," and so forth. The popup layer control at the bottom of the screen shows the document's layers, and renaming each layer with a descriptive name makes navigating through layers much quicker and easier.

The popup layer control lists layers from top to bottom, with the bottom-most layer listed in the bottom of the popup-just as layered sheets of paper would be in real life. The "Layer Manager" allows you to adjust layer names, stacking order, and whether the layers are transparent, opaque or hidden. Transparent, non-hidden layers are the default.

Slides are analogous to layers, except that slides are always opaque. Slides also use a Master Slide, which can be thought of as a visual template for all other slides. For example, if you wanted to have a company logo on all of your slides, rather than placing it in the exact same place on every slide, simply place the logo on the Master Slide; it will then appear on each slide.

If you have created a number of layers in layer mode, switching to "Slide" mode will cause those layers to be treated as slides. The opposite is also true: if you created a number of slides in slide mode, switching to "Layer" mode will cause those slides to be treated as layers.

There are some other differences when your document is in "Slide" mode. The "Start Slide Show" icon appears in the upper-right of the document; you can use this icon to start your slide show. At the bottom of the screen, the slides popup menu displays all the slides, but it shows them in a stacking order opposite to that of the layer mode: the first slide is on top, while the last slide is on the bottom. Also, the "Layer Manager" becomes the "Slide Manager" in slide mode. Its functioning is otherwise the same.

When in Slide mode, the "Document Size" dialog, from the Layout menu, no longer assumes you are printing your document and provides printing-related document size options; instead, it allows you to tailor your document's size to a screen (or other output device) presentation.

When you are in layer mode, ClarisDraw "names" all newly-created layers "Layer 1, Layer 2 ... Layer n." When in slide mode, ClarisDraw uses the name "Slide 1, Slide 2 ... Slide n". These are merely names, and donÕt imply that there are issues using "layers" in slide mode or "slides" in layer mode. ClarisDraw has to name the layer/slide something, so it uses this default naming scheme.

Other slide show options, such as transition effects, QuickTime movie handling, and background and border colors are set in the "Slide Show" dialog box.

Locked Objects from ClarisImpact Presentations Don‘t Import

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In ClarisDraw 1.0, opening a ClarisImpact presentation document doesn't import locked items on the Master Slide.

To reproduce:

1. Launch ClarisImpact (Presentation).
2. Switch to Master Slide, create a star and lock it.
3. Save the document and quit.
4. Launch ClarisDraw.
5. Select "Open" from the FILE menu and open the document just saved.

Notice the locked star was not imported. The Claris graphics development team is aware of this issue.

Objects Bound to Text do not Print on the Hewlett Packard DeskWriter

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In ClarisDraw 1.0, text bound to an object, saved as PICT, then reopened and printed to a DeskWriter, results in only the text printing.

To reproduce:

1. Launch ClarisDraw.
2. Draw a cylinder about 2.5" by 3".
3. Type a line of 36 pt text, make the text pink and use any font.
4. Select all and choose Bind Text to Object.
5. Save as PICT.
6. Open the PICT.
7. Print to a color DeskWriter.

Notice that only the text printed. The cylinder did not print.

Workarounds:

* Ungrouping first, then printing (but then the text color will change - this is another issue)
* Print to an Apple StyleWriter Pro.

The Claris graphics development team is aware of the issue.
Published Date: Feb 18, 2012

Objects Shift After Resizing

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In ClarisDraw 1.0, resizing a paint frame, PICT, or EPSF object with any pen width greater than hairline causes the object to shift location relative to the pen width.

Note that virtually every object that is created by the ClarisDraw graphics tools will be a PICT object, so this problem can occur with lines, circles, rectangles and the like.

Here's one way to reproduce the problem:

1. Launch ClarisDraw.
2. Select "Show Object Info" from the VIEW menu
3. Create a 1" square paint frame aligned with the grid lines.
4. Exit paint mode and give the frame a 6 point pen.
5. Resize the frame larger or smaller using the lower right handle.

Notice the upper and left locations have shifted according to the Object Info palette.

Another issue is when resizing (reducing) multiple selected objects (or a group) of an amount greater than 20%, significant shifting of the objects may occur causing the selected object(s) to become dramatically out of alignment. Executing the following steps will significantly reduce this shift.

* If the object(s) are grouped, continually Ungroup the object(s) until the Ungroup command becomes grayed out - i.e.. the object(s) are completely ungrouped.
* Select the desired objects to be resized, if not already selected. ALL the objects must be completely ungrouped.
* Choose the Rulers command (under Layout) and set the divisions/inch to 288.
* Under the Arrange menu, choose Align to Grid. Align to both upper left, lower right, and center, in that order.
* Using the Group command, create a single group from the selected objects
* Resize the group. Movement should be minimal.

You may now ungroup and/or regroup the objects.

The Claris graphics development team is aware of this issue.

Opening MacDraw Pro Library Files with ClarisDraw

The library, as well as any object names, can be converted, but grouped objects lose their object names.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

ClarisDraw can open MacDraw Pro Library files directly. To do this, select "Open Library" from the File-menu. The library, as well as any object names, can be converted, but grouped objects lose their object names. You must rename grouped objects in a converted library.

DOS 3.3: Auto-run with a machine language program

When DOS is booted, it runs the program that was in memory when the diskette was initialized, unless you change DOS to BRUNs the Hello file instead.
This article has been archived and is no longer updated by Apple.
In a 48K Apple change the byte at $9E42 from $06 to $34. The following sequence of commands creates a disk that BRUNs Hello when it is next booted.

After putting a blank diskette into the drive:

1. Call -151
2. 9E42:34
3. 3D0G
4. init Hello
5. delete Hello
6. BLOAD the binary program from another diskette
7. BSAVE Hello on the new diskette

Applesoft BASIC: How To Launch From Aristotle

I need to place an option in the Aristotle menu to run an Applesoft BASIC program.

I can get Applesoft BASIC up and running, but cannot seem to get a program to load. Is there any way to start an Applesoft BASIC program from Aristotle?
This article has been archived and is no longer updated by Apple.
On the server, create a folder that contains the Applesoft program and BASIC.System. Rename the Applesoft program to STARTUP:

In the Aristotle Management program, add the program to the class list. The Title of the program can be any name that is appropriate -- it is used only for the Display menu. Set the path to:

/{servername}/{foldername}/{any other foldernames}/BASIC.SYSTEM

Set the Prefix to the Applesoft program's pathname. BASIC.System looks for a program with the name STARTUP in the current folder (subdirectory). If BASIC.System finds the program, it launches it.

The next issue is how to get back to Aristotle. The BYE command will not return the user to Aristotle. Since BASIC.System was the launching program, the BYE command attempts to run BASIC.System. Some method is needed to launch Aristotle again. The following method requires some programming, but does provide a way to get back to the Aristotle menu.

This example assumes that the Aristotle folder is located at the server volume root level with a pathname:

/{servername}/ARISTOTLE/MENU.D/DISPLAY

The example finds the servername and places where {servername} appears in the above pathname.

```
9900 D$=CHR$(4)
9910 PRINT D$;"PREFIX"
9920 INPUT PR$
9930 FOR I = 1 TO LEN(PR$)
9940 IF MID$ (PR$, 1+I,1) = "/" THEN 9990
9950 RT$=RT$+MID$(PR$1+I,1)
9960 NEXT I
9990 PRINT D$;"-/";RT$;"/ARISTOTLE/MENU.D/DISPLAY"
```

The following is a STARTDISCUSS9900 - Set D$ to Control-D.
9910 - Request the current PREFIX.
9920 - Put the current PREFIX into PR$.
9930 - Start loop to extract the servername from the PREFIX.
9940 - Skip the first character of PREFIX (/) and look for the second slash.
When the second slash is found, jump to 9990
9950 - Put all the characters up to the second slash into the variable RT$.
9990 - Run the Aristotle menu display program.

This code can be used as a stand-alone program, or the lines can be added to the Applesoft program.

- If used as a stand-alone program, place it in the same folder as the Applesoft program. After quitting the Aristotle-launched Applesoft program, the student needs to type:

RUN {name of program}

- If added to the Applesoft program, these lines need to be the very last lines that are executed in the BASIC program. Remember, the line numbers need to be appropriate for the program to which they are added.

Opening Paint Documents in ClarisDraw

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The best way to bring paint (or other bitmapped) documents into ClarisDraw for editing is by using either the "Open" or "Place File" choices from the FILE menu. Once the picture is in the document, select it, and choose "Ungroup Picture" from the ARRANGE menu. You can then double-click on the image to edit it in a paint frame.

This method retains the image's original resolution and bit depth. However, it can also change the image in some ways, such as modifying the image's size, color, or angle of rotation. If you ungroup the picture and then aren't happy with the results, immediately select "Undo" from the EDIT menu, before performing any other operation. The "ungroup" action will be undone.

"This Document has been updated while you worked on it" Message

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Q: MacDraw Pro says that my document has been updated while I was working on it. What does that mean?

A: This is a feature of the product. MacDraw Pro allows you to open more than one copy of a document so that you can edit different versions, or so more than one person on a network can edit the file at once.

If two copies of a file are open, changes are made to one file, then it is saved and closed, as soon as you try to save the other file you will see this alert:

This document has been updated while you worked on it. Do you still want to save your changes?

You are given the option of saving your changes to the current file, performing a "Save As" so that you can save your changes to different file, or canceling the save altogether.

ClarisDraw does not offer this feature.

Print Range Selection Ignored When Printing Slide Presentation Handouts

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When printing a range of slides with "Print Both" slides and handouts option selected, the print range is ignored for handouts.

To reproduce:

* Open a new ClarisDraw document or a new ClarisImpact presentation document.
* Create three slides with objects on each.
* Open the Print dialog.
* Print pages 1 to 2 and select "Both" from the Slides/Handouts options.

Result: Slides 1 and 2 are printed as slides, but all three are printed as handouts. The workaround is to print slides and handouts separately.

The Claris graphics development team is aware of this issue.

Rotated, Colored Text Prints Black

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Under some conditions, ClarisDraw will print rotated, colored text in black when you're printing to a printer using a 7.x driver. This is most noticeable when you've created a document that uses grayscales.

To reproduce:

* Launch ClarisDraw
* Create a short caption text object and duplicate it four times
* Assign a different text color to each object
* Select All and Duplicate
* Move the duplicates aside and rotate them slightly
* Print to a laser printer or color printer with the 7.1.x driver.

The rotated, colored text prints black. Note that white rotated text prints correctly (in front of a colored background, of course)

Workarounds:

* Print using a 8.1 driver
* Print using a QuickDraw printer

The Claris graphics development team is aware of the issue.

Screen Turns Entirely Black (68000 Macintoshes Only)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
With ClarisDraw running on a 68000-based machine (Macintosh Plus, SE, Classic, Portable or PowerBook 100), if you open one of ClarisDraw's additional 256 color palettes, the screen will turn entirely black. Closing and reopening the document brings the document back.

To reproduce this:

1. Do an Easy Install on a 68000-based machine
2. Launch ClarisDraw
3. Select the Colors & Gradients dialog from the Layout menu, choose 256 colors, and open one of the color palettes. Select either Preserve or Adjust colors.

You will see a cross line is drawn on the dialog box, and then the whole screen turns black. This in no way affects the integrity of the document - it is a display issue only. Again, closing and reopening the document fixes the problem.

Since 68000-based machines cannot make use of the additional color palettes in ClarisDraw, there is no point to opening them, or even having them installed on the machine. The best thing to do is delete the Color Palettes folder from the ClarisDraw folder - there is no need for it.

The Claris graphics development team is aware of this issue.

Text Converted to Bezigons Pastes Incorrectly into Deneba Canvas

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In ClarisDraw 1.0, text converted to bezigons, then copied into a Canvas document via the clipboard, pastes with many of the characters as black filled rectangles.

To reproduce:

1. Launch ClarisDraw
2. Create some text, then convert the text to bezigons
3. Copy the text
4. Launch Canvas version 3.5
5. Paste

Notice that many of the characters are black filled rectangles (mostly the ones with holes).

Workaround:

Select the converted bezigon text, then set the pen color to black, the fill to white, and the pen width to one point.

Published Date: Feb 18, 2012

Text With Gradients Pastes Incorrectly Into Aldus Freehand

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In ClarisDraw 1.0, text converted to bezigons, then filled with a gradient, pastes into Freehand with the gradient spilling beyond the bounds of the text.

To reproduce:

1. Launch ClarisDraw.
2. Create some text, then convert the text to bezigons.
3. Fill the converted text with a gradient.
3. Copy the text.
4. Launch Freehand
5. Paste.

Notice that the gradient fill spills beyond the bounds of the text. The Claris graphics development team is aware of this issue.
Published Date: Feb 18, 2012

What do "Preserve" and "Adjust" Colors Mean?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you already have objects in your document, have been using either the 81- or 168-color palettes, and you change to the 256-color palette in the Colors & Gradients dialog box, you will see a dialog box advising you that the colors may change. You're also asked to choose between "Preserve colors" or "Adjust colors".

What does this mean? When you change palettes, there is a possibility that the palette you're changing to (the 256-color palette) might not have the exact color or colors you've chosen from the palette you had been using. So ClarisDraw gives you a choice: either preserve the colors you've selected by remapping them into the 256-color palette, or change the colors to the closest available match already in the 256-color palette.

If you choose "Preserve colors," then ClarisDraw will first extract the colors you've already used in your document. It will then replace colors in the 256-color palette with the shades you've used. It will replace colors starting in the lower-right corner of the palette and work left and up. The colors that were originally in the 256-color palette will be permanently replaced with the new colors from your document.

If you select "Adjust Colors," ClarisDraw will go through the 256-color palette, find colors as close as possible to the ones you've already selected, and use them to fill the objects in your document.

Since there is color overlap between the three palettes, there is a possibility that the colors in your document might not change at all, regardless of which option you choose.

The options to preserve or adjust the colors are only available with the 256-color palette, because it is the only palette that is editable. If you switch from the 256-color palette to either the 81 or the 168-color palettes, you will only received a dialog telling you the colors "may be changed."

Why Is the ClarisDraw Manual so Thin?

The ClarisDraw manual is significantly less bulky than the MacDraw Pro manual. Why is that, and what are the advantages and disadvantages?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
ClarisDraw is the first Claris product to follow a new concept in documentation. Many customers told us that the typical product manual did not suit their needs, and therefore, they did not tend to use it. They wanted specific solutions to specific problems, while many user guides simply detailed each feature.

At the same time, it became clear that printed materials were getting more and more expensive to produce. Since some customers weren't using the printed documents that came with our products, Claris formulated a new approach.

Our research found that many customers are very happy with a versatile, well-designed electronic help system, especially when it is combined with a printed manual that is solutions-oriented rather than feature oriented.

For ClarisDraw 1.0, Claris implemented this new system of documentation. The ClarisDraw 1.0 User's Guide is significantly smaller than the one that shipped with its predecessor, MacDraw Pro; but by comparison, the ClarisDraw manual goes to much greater lengths to describe HOW to do things as opposed to simply reciting features.

What is not as readily apparent when you open the box, though, is the fact that the on-screen help that ships with ClarisDraw is dramatically different from the on-screen help that shipped with MacDraw Pro. The new on-screen help that ClarisDraw uses features interactive definitions (click on certain words and definitions appear on-screen); search by topic or article text; the ability to "retrace your steps" while looking at articles; the ability to view a table of contents or topics alphabetically; note-taking capability; and much more. You can also easily print any portion of the on-screen help that you want.

So we changed the way the User's Guide provide information, and we dedicated more resources to the on-screen help. While the manual details procedures, it frequently refers you to the on-screen help for specifics. The on-screen help is designed to be the place that you go for explanations of specific features; it is more comprehensive than the User's Guide. The User's Guide, however, does provide an excellent overall view of the product. The on-screen help and the User's Guide complement each other to provide you with the most assistance possible, obtained as easily as possible.

A Glossary of ClarisWorks Database Terms (DB)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Record:

Each "card" in a database file is a "record". In a name and address database, each "record" contains information about one person. In a database of audio CDs, each record contains information about one CD.

Field:

The information you store in a database record is organized in categories. Each category is called a "field." For example, in a name and address database, you would put a person's last name in a LAST NAME field, his or her telephone number in a PHONE field, and so on.

Entry:

The data you store in one field in a record. The name "W.T. Southern" could be an entry in the AUTHOR field; the characters "12" could be an entry in the PAGE field.

File:

All the records taken together comprise a "database file." You create the database file when you save your database to disk. Some database applications save two files - one file that stores the structure of the database and another file for the data. ClarisWorks stores one database file that contains both types of information.

ClarisWorks Field Types

Field Type:

The field type determines the kind of data you can store in a field and what you can do with that data. ClarisWorks lets you define six types of fields. Here is a brief profile of each:

Text field:

Accepts any characters you can type at the keyboard. You usually store words and phrases in text fields, but you can store codes, social security numbers (which contain numbers and hyphens), and any mix of characters in these fields. You can enter more data into a text field than can appear on screen; later, you can manage that problem by changing the layout.

Number field:

Accepts any valid number and lets you use those numbers in calculations and numerical sorts.

Date field:

Accepts any valid date entered as text (for example, May 1) or as complete or incomplete numbers (as in 5/1/92 or 5/1). ClarisWorks inserts the current year if you omit the year. ClarisWorks displays all dates in the format MM/DD/YY and can sort dates chronologically. The program warns you if you enter an invalid date such as "4/31/92" or "Ma 1."

Time field:

Accepts any valid time entered as numbers on a 24-hour clock (for example, 16:00 represents 4 P.M.). ClarisWorks can sort time entries chronologically. The program warns you if you make an invalid entry.

Calculation field:

Accepts formulas that manipulate data in other fields. The calculated result appears in each record. The results can be a number, a date, a time, or text. For example, you can create a Calculation field that automatically calculates a student's average from a set of test scores, the number of days between two dates, or the final price of an item for sale.

Summary field:

Accepts formulas that perform calculations on a set of records in your database. You can use a summary field to calculate the average score of a group of students or to determine the total sales by a group of salespeople.

HyperCard: Global/Local Variables

Is there a way within HyperCard to retrieve and/or set a local variable for handler "xyz" from handler "abc"?

I don't want to make everything a global variable and have them initialized as the stack is opened.

This article has been archived and is no longer updated by Apple.
What you want to do is not possible. However, there are a number of ways to "fake" global-local variables.

You could create one global variable (in this example, "holdEm") containing many items.

For example:

put "1,5.67,fred,in,0,,rain" into holdEm

stores seven items in the variable named holdEm. To avoid a lot of messy initialization, the information in the variable could be saved in a field:

put holdEm into field storeVars

and restored to the variable when the stack opens:

put line 1 of field storeVars into holdEm

This is much faster than seven put statements.

ClarisWorks Tip: Use the "Copy Table" Command (CM,SS)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

The communications environment offers a Copy Table Command that automatically copies and pastes tables from a communications document into a spreadsheet. That makes it easy to copy stock information and other tabular data received from your on-line service into any ClarisWorks document.

Follow these steps to copy tabular data you captured from a bulletin board service into a spreadsheet:

1. Click and drag to highlight the information in the communications document on your screen.

2. Choose "Copy Table" from the Edit Menu.

3. Create a new spreadsheet or switch to an existing spreadsheet template.

4. Click in the cell where you want the first piece of tabular data to appear.

5. Choose "Paste" from the Edit Menu. ClarisWorks will paste each piece of data into a separate cell.

Classifications of Clip-Art (All)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Classifications of Clip-Art

You can classify electronic clip-art into three categories depending on the type of program used to create the image.

Paint:

Paint programs provide tools such as paint brushes, air brushes, and pencils you use to "paint" on your Macintosh screen as you would on paper. Paint documents are "bit mapped", which means that each pixel or "bit" is defined on a "map" of the page. Paint programs give you complete control over each pixel in the image you create; the resulting images often include fine details reminiscent of antique etchings. An example of a bitmapped image produced with a Paint program appears in Figure 1.

Draw:

Draw programs, such as the Graphics module in ClarisWorks, produce "object-oriented" art. These programs create images by layering "objects" defined by mathematical equations, such as circles, squares, lines, and blocks of text. Although you can produce complex images using shading and patterns with a Draw program, most Draw images look like the line drawing example in Figure 2.

Bezier

Draw: Bezier Draw programs produce "Bezier object" art which contains objects drawn with Bezier curves. (A Bezier curve is a line defined as a series of points, each of which have zero to two control points or handles.) The complex mathematical formulas supported by Bezier Draw programs let you define more complex shapes than those you can create with simple Draw applications. The most common Bezier Draw images are sophisticated line drawings with shading, patterns, and colors like the example in Figure 3.

Creating a Simple Macro in ClarisWorks - A Tutorial (All)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Applications for macros become more obvious once you start to use them, so let's create our first macro. This macro will teach ClarisWorks how to type your name with a single keystroke. The process involves telling ClarisWorks to capture your keystrokes and assigning a key combination to the keystrokes it memorizes. Then ClarisWorks will repeat the keystrokes when you type the keys you specified.

Follow these steps to create the macro:

1. Go to the File Menu and select "New." Indicate that you want to create a new word processor document.

2. Go to the File Menu, press the mouse button, and move the cursor down until it is over "Macros." The Macro Menu will appear to the right (see Figure 1). Select "Record Macro." (Alternatively, you can issue a Command-Shift-J to start to record the macro.) ClarisWorks will display the Record Macro Dialog Box that appears in Figure 2.

3. Use the Record Macro Dialog Box to (a) define the keys you will press to invoke (or "run") the macro, and (b) assign a name to the macro.

Put the cursor in the box to the right of "Option + Command + Key" and type a lower case "n" (for "Name"). You should assign your macros to lowercase characters. Otherwise you will need to press four keys to launch your macros.

Press the Tab Key and enter "My Name" as the name for the macro. Then press the Return Key.

4. The flashing microphone icon in the upper left-hand corner of the screen indicates that you are recording a macro. Now you will enter the text you want ClarisWorks to type when you enter an Option-Command-n.

Type your name. If you make a mistake, use the Delete Key to erase the error and retype the correct keystrokes. Although ClarisWorks will memorize the wrong keystrokes and your presses of the Delete Key, the macro runs so quickly that you needn't be concerned about the extra keystrokes.

5. Stop recording the macro by issuing a Command-Shift-J or by going to the Macros Menu and selecting "Stop Recording" from the Macro Menu. The flashing microphone icon will disappear.

Now test the macro. Put the cursor anywhere in a document and press Option-Command-n. ClarisWorks will type your name.

Editing ClarisWorks Macros (All)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Although ClarisWorks makes it easy to create macros, it does not let you modify your macros. To change a macro, you must delete the original and create a new macro.

Follow these steps to delete a macro:

1. Go to the Macros Menu and select "Edit Macros".

2. ClarisWorks will display the Edit Macro dialog box. Click on the macro you want to delete, click on the Delete Button and click on "OK" to confirm the deletion.

You can delete more than one macro in a single operation by holding down the Shift Key while you highlight the macros you want to delete.

ClarisWorks does lets you change the name and/or Option-Command-key combination that invokes your macros. Just select "Edit Macros" from the Macros Menu, highlight the macro(s) you want to rename and change the entries.

Finding Empty Database Fields in ClarisWorks (DB)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Q. I miss the AppleWorks database option that lets me select fields that are blank or not blank. Is there some way to do this in ClarisWorks?

A. You can use the Match Command to select records with blank or non-blank fields. The following example demonstrates how to search for records with a blank entry in the PHONE field:

1. Go to the Organize Menu and select "Match Records" (or press Command-M).

2. Scroll down the Function Window to display the ISBLANK function and click on that function. Then double-click on the word "value" displayed in the Formula Window, and click on PHONE in the Fields Window.

Alternatively, you can type the formula ISBLANK('PHONE') into the Formula Window.

3. Click on "OK" to select all the records with blank PHONE fields.

4. Choose "Hide Unselected" from the Organize Menu to display the selected records.

To find all non-blank records, just follow steps 1-3 above, and choose "Hide Selected" from the Organize Menu.

How to Add Selected AppleWorks Data to a ClarisWorks Database (DB)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

This article describes how to add selected AppleWorks records to an existing ClarisWorks database, even if the two files have dissimilar fields. You will need a 3.5-inch disk drive connected to your Apple II computer to accomplish this transfer.

Transferring the data is a four-stage process:

1. "Print" the AppleWorks database as a DIF file on your Apple II.

2. Use Apple File Exchange to transfer the file to your Macintosh.

3. Use the file to create a new ClarisWorks spreadsheet and rearrange the data in the spreadsheet.

4. Paste the data into your ClarisWorks database.

Step-by-Step Tutorial

This tutorial takes you step-by-step through the process of transferring name and address information from an AppleWorks file into an existing ClarisWorks database. You can generalize these procedures to any other files. We will assume that you know how to use both AppleWorks and ClarisWorks.

Follow these steps:

1. Create AppleWorks and ClarisWorks database files with the same categories and fields. Define the ClarisWorks fields as "Text."

2. Enter four sample records into each file. Enter different data in each record.

Now you will prepare a ProDOS DIF file you can import into ClarisWorks. Continue as follows:

3. With AppleWorks: Issue an Apple-P and prepare a tables format report that includes the categories you want to transfer into ClarisWorks. Rearrange the categories so they match the order of the fields in the ClarisWorks database. (That is, switch the positions of the LNAME and FNAME categories.) Do not worry about the missing ADDRESS2 category; you will create blank entries after you transfer the data into ClarisWorks.

4. Issue an Apple-R command and select the records you want to transfer into ClarisWorks. In this example, select all records where the LNAME category "is not blank."

5. Issue another Apple-P command and "print" the report as a DIF file on a 3.5-inch disk. (To save the file in DIF format, select the last choice on the Print the Report Menu and enter the pathname /DISKNAME/TEMP where you replace "DISKNAME" with the name assigned to your data disk.)

6. Launch Apple File Exchange on the Macintosh.

7. Insert the ProDOS disk in the Macintosh drive, pull down the ProDOS to Mac Menu and de-select "AppleWorks to Microsoft Works" (see Figure 1).

8. Click on the file TEMP in the Apple File Exchange window and then click on Translate (see Figure 2). That will save your AppleWorks file on the Macintosh drive.

9. Select "Quit" from the File Menu (or press Command-Q) to quit Apple File Exchange. Remove your ProDOS disk from the Macintosh drive.

10. Return to ClarisWorks and select "Open" from the File Menu (or press Command-O) to indicate that you want to open an existing file.

11. Click on the Import Options Lever and then click on the Spreadsheet Button (see Figure 4). Navigate to the TEMP file, highlight that file, and click on "Open." ClarisWorks will create a new spreadsheet with the data from each AppleWorks record in a separate row. Your screen will look

like the example in Figure 3.

Now you will insert blank entries that will appear in the ADDRESS2 field in your ClarisWorks database. You want that blank to appear in the fourth field in each record, which corresponds to column D in the spreadsheet. Continue as follows:

12. Select all the entries in column D by clicking on the letter "D" at the top of that column.

13. Select "Insert Cells..." from the Calculate Menu (or press Shift-Command-I). ClarisWorks will insert an empty column of cells in column D and will shift all the remaining data one column to the right.

Now you will transfer the data from the spreadsheet into the database. Continue as follows:

14. Choose "Select All" and then "Cut" from the Edit Menu (or press Command-A and then Command-X).

15. Select the name and address database from the View Menu.

16. Choose "Paste" from the Edit Menu (or press Command-V).

17. Press Command-S to save your work.

That does it; the new records are now in your ClarisWorks database file.

We suggest that you explore the ability of ClarisWorks to transfer data between the program's database and spreadsheet environments. ClarisWorks' ability to transfer data between these environments lets you use the program's spreadsheet module to reorganize the data in your database records.

How to Combine Multiple-Cell Labels (SS)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Importing AppleWorks spreadsheets into ClarisWorks is easy. However, your imported spreadsheet will need some work before you can use it in ClarisWorks. Part of the problem is the different ways AppleWorks and ClarisWorks handle long labels.

AppleWorks divides long text entries into separate cells. Thus, AppleWorks users who change column widths must retype their multi-column labels.

ClarisWorks stores long labels in a single cell and displays the label across multiple cells if the adjacent cells are empty. That lets you change column widths and fonts without segmenting the label.

However, the differences between the two programs causes a problem when you import an AppleWorks spreadsheet into ClarisWorks. AppleWorks exports the text as a series of separate labels in adjacent cells (see Figure 1). Any changes you make to the format of those cells in ClarisWorks result in missing characters or extra spaces between columns.

If you only have a few long labels, you can re-type the multiple cell labels in ClarisWorks and then blank the remaining cells. However, that is time-consuming and can result in typing errors.

Here are two workarounds that can save you time and effort:

Strategy #1: Successive Cuts and Pastes

The first approach has you cut and paste the contents of each cell. Refer to Figure 1 as you do the following:

1. Click on Cell B1, the cell to the right of the first label cell.

2. Go to the Edit Menu and select "Cut" (or press Command-X) to cut the contents of the cell to the clipboard.

3. Click on the first label cell (that is, cell A1).

4. Go to the Data Entry Bar and click at the end of the text.

5. Paste the text from the clipboard by selecting "Paste" from the Edit Menu (or press Command-V). You screen should now look like the example in Figure 2.

6. Repeat steps #1-5 for cells C1 through E1.

Strategy #2: Deleting Tabs

In the second approach, you cut the contents of the range of cells, from A1 through E1, and edit them in the word processor. Follow these steps:

1. Click on cell A1 and drag the cursor to select the range of cells through E1.

2. Press Command-X to cut the contents of the range of cells to the clipboard.

3. Press Command-N to create a new file, and click on "OK" to create a "Word Processor" document.

4. Press Command-V to paste the contents of cells A1-E1 from the clipboard into the word processor file.

5. Press Command-F to call up the Find/Change Window.

6. With the cursor in the Find Box, press Command-Tab to enter a tab. ClarisWorks will display "\\t" in the Find Box (see Figure 3).

7. Press the Tab Key to go to the Change Box.

8. Press the Delete Key; nothing will appear in the Change Box.

9. Click on the Change All Button. ClarisWorks will delete all the tabs.

10. Click and drag across the reassembled text to select it, and press Command-X to cut it to the clipboard.

11. Go to the View Menu and select the spreadsheet document to return to it.

12. Click on cell A1 to select it. Then press Command-V to paste the contents of the clipboard into cell A1.

13. Repeat these steps for each multi-cell label. You can create a ClarisWorks macro that automates this process (see the sidebar).

Cell A1 now contains the entire text string. Adjusting the width of columns B through E or changing fonts will not inadvertently delete characters or insert blank space into the label.

How to Display More Columns in a ClarisWorks Database

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Q: As a former AppleWorks user, I like to examine my data in a tables format. ClarisWorks lets me display my data in columns, but does not let me scroll all the way across the fields. Is there some way to do this?

A: Viewing your data in columnar format is convenient. As you discovered, ClarisWorks lets you set up a columnar display of your data.

To get a columnar display, choose New Layout from the Layout Menu, and select Columnar Report. Then choose the fields you want to appear in the display by moving them into the Field Order list and click on Move.

The trick to setting up a wide set of columns is to tell ClarisWorks to format the layout to fit on a wide sheet of paper. To do that, go to the File Menu, select Page Setup and then select the Landscape (horizontal) orientation for printing. Now the horizontal scroll bar will become active and you can scroll to the right to display the remaining columns.

If you still can't get all your columns in the layout, go back to the Page Setup in the File menu and tell ClarisWorks that you want to print in landscape mode on US Legal paper. Since US Legal paper is 14 inches long, reports formatted to print in landscape mode on legal paper let you scroll left and right over almost a 14-inch area.

Note: ClarisWorks applies your current page setup to all your existing layouts. When you switch to landscape mode, some layouts will appear cut off at the bottom when you do a Page View. However, your layouts are still intact and will be correct when you reset the page orientation to vertical.

You can remind yourself of the correct page setup for each layout by adding the suffix ".HRZ" to the name of any horizontal layout and ".VRT" to vertical layouts. That will help you remember to go to the Page Setup Window and change the orientation of the "paper" on your screen.

Note: ClarisWorks 4.0 can do this simply by choosing List from the Layout menu.

Too much space between graphics and wrapped text
If there is too much white space between a graphic and text wrapped around it in your word processing document, you may need to change your paragraph line spacing units. Choose Paragraph from the Format menu. A dialog box appears that allows you to modify paragraph spacing attributes for the currently selected paragraph(s). In the pop-up menu next to the Line Spacing setting, the default unit for adjusting line spacing is "li" (lines). Using any other units, such as points or inches, for setting line spacing will result in a large amount of white space between graphics and the wrapped text.

Solution
Set the Line Spacing units back to lines in the Paragraph dialog box. You can still flexibly change line spacing by specifying 1.5 lines, 2.0 lines, 2.5 lines, etc.; however, the smallest fraction of a line you can specify is a half (0.5) line.

How to Use Calculated Fields (DB)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

The ability to manage calculations in ClarisWorks database fields adds significant power to the program. Once you master the concepts behind these calculations, you can tell ClarisWorks to automatically perform any operation you specify and store the result in a database record or print the results on any page in a database document.

How ClarisWorks Operates

Calculated fields contain three components:

1. The formula you enter into ClarisWorks,

2. The format you specify for your output, and

3. The data that ClarisWorks displays in the field.

ClarisWorks stores the formula and format, but not the results of the calculations. Instead, it performs the calculations each time you display or print the calculated field.

Types of Functions

Although we generally think of "calculations" as related to numbers, ClarisWorks can "calculate" numbers, dates, times, or text. The output you get depends on the "operation" or "function" you specify. For example, "AVERAGE" is an arithmetic function that generates the average of the values or field references within parentheses after the word AVERAGE.

"TEXTTODATE" is a date function that converts the current date into a numeric value that you can use in numerical calculations.

"PROPER" is a text function that capitalizes the first character in every word involved in the "calculations."

ClarisWorks offers eight different categories of functions: business and financial, date and time, information, logical, numeric, statistical, text, and trigonometric functions; 100 different database and spreadsheet functions in all.

Complete descriptions and sample applications of these functions appear in Appendix A in the ClarisWorks documentation and in the on-line help system available within ClarisWorks.

Types of Calculated Fields

The ClarisWorks database environment lets you use these functions in two different types of calculated fields:

1. "Record Calculation Fields", which display the results of the calculation within each database record. ClarisWorks calls these "Calculation Fields."

2. "Summary Calculation Fields", which perform calculations across records. ClarisWorks calls these "Summary Fields."

You would use a Calculation Field to count the number of days between a client's last payment and the current date. That is the type of information you want to display in the client's record.

You would also use a Calculation Field to determine a student's average test grade. Again, you would display that information in each student's record.

You would use a Summary Field to count the number of sales people on your staff or to determine their average sales. These numbers would appear in a summary area at the end of a report and not in an individual record.

Figure 1 depicts a database layout that lists the grades for some of the students in a class. The "Average Grade" field in Figure 1 is a Calculation Field that computes each student's average grade during the marking period and displays that grade as part of each student's record. The formula for the Average Grade is AVERAGE('TEST.1','TEST.2', 'TEST.3','TEST.4').

The "Student Count" and "Student Average" fields are Summary Fields that appear in the Grand Summary segment of the report. The formulas that perform the calculations are COUNT('FNAME') and AVERAGE('AVERAGE GRADE') respectively.

As you can see from these examples, both types of fields use the same formulas and functions. You "tell" ClarisWorks whether to calculate within records or across records when you define the field (see Figure 2). When you check "Calculation" as a field type, ClarisWorks calculates within each record. Check "Summary" as a field type and ClarisWorks calculates across records.

The Elements of Calculated Fields

You must specify a formula for every calculated field; each formula includes some combination of the following four elements:

1. Other database fields that you enclose in single quotes in the formula. For example, a Total Sales field might contain the formula 'Region1 Sales'+ 'Region2 Sales'+'Region3 Sales'.

2. A built-in ClarisWorks function, such as SUM( ), TEXTTODATE, or UPPER( ). For example, the formula SUM('SALARY','COMMISSION','OTHER') in a Calculation Field will compute the total earnings of every employee. ClarisWorks will store that total within each record.

The formula AVERAGE('WEIGHT') in a Summary Field will compute the average weight of all the "unhidden" individuals.

3. Data that you type in the formula. This can be numeric data such as the "12" in the formula 'Monthly Income' * 12 or text constants that you enclose in double quotes (to differentiate between the text and field names), as in the formula "Dear " & 'LNAME'. (This formula lets you create a new field that combines data from other fields in the record.)

4. Operators, which indicate the type of calculation you want to perform. The ClarisWorks manual lists the operators you can use in formulas within ClarisWorks database documents.

Inserted Date Does Not Save with Document (All)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Q. I use the Insert Date function to automatically insert dates in my letters. But ClarisWorks doesn't save the date with the rest of the letter. As a result, I cannot look at the document on the screen and determine when I originally wrote the letter.

Why doesn't ClarisWorks and ClarisImpact save my dates?

A. As you discovered, the "Insert Date" feature puts a command, not the actual date, in your document. The command tells ClarisWorks and ClarisImpact to check the clock in your Macintosh and display the current date on the screen and print the current date in the document. However, despite its name, the Insert Date command does not actually insert the date in the document.

The Insert Date command makes it easy to prepare documents that serve as templates; ClarisWorks and ClarisImpact automatically insert the current date in the document when you print a copy for a new recipient.

However, this same feature works against you when you prepare a letter that you want to store on a disk. Although ClarisWorks and ClarisImpact will insert the correct date when you print the letter, the program does not store the date in the electronic copy of the letter.

Of course, your Macintosh does record the date that you originally created the letter. You can display the "creation date" of the file by going to the Finder, navigating to the file that contains the letter, and issuing a Command-I (or by selecting "Get Info" from the File Menu). The Get Info box that appears on your screen includes the creation date and an area that you can use to store notes about the document.

PLEASE NOTE: Holding down the Option key as you choose "Insert Date" will cause the date to save as of the date it was entered.

Printing on the ImageWriter in "Faster" and "Best" modes. (All)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
This is fixed in ClarisWorks 1.0v2

Q: I don't see any difference between the ClarisWorks documents I print on my ImageWriter in "Faster" and "Best" modes. Shouldn't documents printed in the Best mode look significantly better than those printed in Faster mode?

A: Certainly there should be a difference in your output, but version 1.0 of ClarisWorks could only produce "Faster" and "Draft" quality, not "Best" quality output on an ImageWriter. In addition, any other application you run after printing from ClarisWorks may behave in the same way until you restart the computer or change printers in the Chooser.

We resolved this problem with the release of ClarisWorks 1.0v2, which lets you print "Best" or "Draft" quality output (but not "Faster" output) on the ImageWriter. We're working on offering all three levels of output in future versions of ClarisWorks. [Ed: "Best" quality printing is more attractive than "Faster" quality. However, "Best" quality requires two passes of the printhead to print each line and is much slower than "Faster" quality output.

Problems with the Fill and Paint Tools (All)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Q. I can't get the Sample Box to the right of the Fill icon and Pen icon to work properly. I draw an object and select the fill pattern I want. The object fills correctly, but the fill pattern I selected does not appear in the Sample Box to the right of the Fill icon.

A. The Sample Box to the right of the Fill and Pen icons shows you the pattern that will appear in your next object. Follow these steps to see how they work:

1. Create a new graphics document and note that the Fill icon's Sample Box appears blank but is really white. The next object you draw will fill with white.

2. Click on the rectangle tool, and draw a rectangle. Note that the grid disappears behind the object because the object is filled with white.

3. Select "Black" from the Fill Palette. Note that the object now fills with black. However, the Sample Box remains white because ClarisWorks will fill the next object with white. To demonstrate that, click on the rectangle tool and draw another rectangle.

4. Click anywhere on the blank graphics page to de-select all the objects on the page. Now select any pattern from the Fill Palette. The Sample Box now shows that pattern, indicating that ClarisWorks will fill the next object with the pattern you selected.

5. Click on the Rectangle Tool and draw a rectangle. ClarisWorks will fill that rectangle with the pattern displayed in the Sample Box.

It takes a while to get accustomed to using the Sample Box correctly. However, once you understand how it works, you can appreciate the convenience of this feature which lets you change the pattern in any object without changing the pattern that will appear in all future objects.

This article has been archived and is no longer updated by Apple.

Q. Is there a keyboard shortcut for inserting a page break in a ClarisWorks Word Processing document or a ClarisImpact Report document?

A. You can insert a page break in a word processor document by going to the Format Menu and selecting "Insert Break" - a process that is cumbersome and too slow for most of us (for ClarisImpact choose Insert Break from the Text menu).

Fortunately, there is a keystroke shortcut: Just press the Enter Key on the numeric keypad. ClarisWorks nd ClarisImpact will insert a page break below the text you were typing and will put the cursor on the new page. To delete the page break, put the insert cursor in front of the first character on the new page and press the Delete Key.

Note that the page break feature does not work when preparing spreadsheet, database, or graphics documents. In these cases, the Enter Key activates a cell, enters a database record, or completes a text entry, respectively.

Calculating Margin and Markup (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In accounting, there is a distinction made between "margin" and "markup."

Basically, "markup" is the amount of increase in price over cost. If your cost is $1.00, and the retail price is $1.20, the markup is $0.20, or 20%.

To generate that markup, you can easily find your sale price by adding the amount of the original cost to the amount of the markup with the following formula:

=Cost + (Cost * Markup Percentage)

Because you are providing the percentage markup, you specify the profit margin. In this example, the profit margin is $0.20 (the profit), which is 1/5 (20%) of the the retail price of $1.20.

However, "profit margin" is a fixed percentage profit, based on the final sale price. If your cost is $1.00, and you specify that you must have a final margin of 20%, you must make sure that the cost is 80% of the final price. $1.00 is 80% of 1.25, which retains the 20% profit margin. (For example, if you have a sale price of $1.20 and a cost of $1.00, the profit "margin" is only 17%, because your final sale price is $1.20 and your profit is only $0.20. $0.20/$1.20 = .166 or 17%.)

The formula that you would use to calculate the required sale price, to preserve a margin based on the final cost is:

=Cost/(1-Margin Percentage)

Alternately, the formula you would use to calculate the margin, based on a final cost is:

=1-(Cost/Selling Price)

Cursor is Displayed Ahead of Inserted Text (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Cases have been seen where the cursor is ahead of the text being typed. So far, this has only been seen with the Helvetica font in system 7.1 and 7.5.

Symptom: You are typing in a document, and your cursor is several spaces ahead of you. This can be seen anywhere the font is used.

Here are some options to fix the problem:

* Open the Fonts folder, which is inside the System Folder. Drag the problem font suitcase out of the System Folder. Then open that font suitcase and place its contents back in the Fonts folder. This will leave the individual fonts loose in the Fonts folder. In most cases, that fixes the problem. Quit your applications, then open a document again to test the results.

* If the first option does not work, first verify you have an original, undamaged copy of the problem font on floppy disk. Move the individual problem fonts out of your Fonts folder, and into the trash. Empty the trash to delete them. Then drag the good copy of the problem font suitcase from original floppy disks to the Fonts folder.

*Turning on the Fractional Character Width preference can reduce or eliminate the problem, but may not solve it.

MAX Number of Users Message When Using International (Non-US) Versions of ClarisWorks (All)

You must install international versions of ClarisWorks with a separate set of installer disks (not with the same set of installer disks) for each installation on the network.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Q. I am getting a dialog box stating "The maximum number of licensed users are currently using this copy of ClarisWorks," throughout the use of my ClarisWorks program. The dialog box appears on some terminals only some of the time. Each terminal has a copy of ClarisWorks which was installed separately on my network. What is the problem?

A. The only conditions under which you get this message are:

* The same installer disk was used to install different copies of the software (effectively meaning that the system then regards them as the same copy of ClarisWorks). You must install ClarisWorks with a separate set of installer disks (not with the same set of installer disks) for each installation on the network.

* Any serialized version of ClarisWorks running on a machine which is also a network router will fail to launch.

System Software 6.0.5: ADB Problems and Workarounds

This article contains information about compatibility problems between System Software 6.0.5 and some Apple Desktop Bus (AAD)B devices.
This article has been archived and is no longer updated by Apple.
Apple made some significant changes to the code handling ADB devices in System Software 6.0.5 (see Macintosh Technical Note 206, "Space Aliens Ate My Mouse"). Because of these changes, certain ADB peripherals don't operate properly.

So far, we've seen the following:

- A+ Optical Mouse: very jerky, inconsistent movement. According to someone on Usenet, Mouse Systems has acknowledged it as a hardware bug in the mouse that did not show up in System Software releases before System Software 6.0.5.
- The Abaton trackball causes the system to freeze, either during startup or later. It may work for a while, or it may just hang the system.
- The Kensington Turbo Mouse ADB also causes the system to freeze. Kensington has released an INIT that fixes this problem. Contact Kensington for a copy of this INIT.

About Version 2.1v4 Macintosh Updater, Read Me

If you already have 2.1v3, and to not print to an ImageWriter, you will obtain no advantage from installing the updater. The 2.1v4 upddater should not be used on Power Macintosh versions of ClarisWorks

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Using your Claris Software Express Updater - ClarisWorks 2.1v4

This document describes the steps you must take to update your current ClarisWorks software to 2.1v4. You may want to print these instructions so that you can refer to them later. This updater will not update Apple Power Macintosh versions of ClarisWorks and is intended only for use with ClarisWorks for Macintosh 68K computers.

IMPORTANT
There are two different updaters. The correct one to use depends on the version of ClarisWorks you are currently using. If you have ClarisWorks 2.0, you should use the "ClarisWorks 2.0v1-->2.1v4" updater. If you have ClarisWorks 2.1v1, 2.1v2, or 2.1v3 use the "ClarisWorks 2.1v1/v2/v3-->2.1v4" updater. To determine which version of ClarisWorks you have, open any ClarisWorks document and choose "About ClarisWorks..." from the Apple menu (in the upper left hand corner of your screen).

Troubleshooting Tips
The updater makes several changes to the resources in ClarisWorks. Many anti-virus utilities consider this activity improper and may try to prevent it. To avoid this inconvenience, disable all virus detection software and restart your Macintosh before applying the update.

If you experience an error while running an updater, restart your computer with the System Extensions turned off. To do this under System 7, press the Shift key while restarting and continue to hold it down until you see the message "Welcome to Macintosh. Extensions off." If this does not correct the problem, double check to make sure you are running the appropriate updater.

If you are going to update from 2.1v1, 2.1v2, or 2.1v3, skip ahead to the section labeled "How to update ClarisWorks 2.1v1, 2.1v2 or 2.1v3 (ClarisWorks 2.1v1/v2/v3-->2.1v4)". If you are updating from 2.0, begin here.

How to update ClarisWorks 2.0 to 2.1v4 (ClarisWorks 2.0v1-->2.1v4):

New Features
ClarisWorks 2.1 has many enhancements and new features, including support for, PowerTalk (electronic mail provided with System 7 Pro), automatic hyphenation, Excel 4.0 import and export, and ClarisWorks 1.0 Word Processing export.

Overview
The accompanying installer software will install all of the files that are either new or changed since ClarisWorks 2.0, as well as, the software needed to update your current copy of the ClarisWorks 2.0 application to the latest version, 2.1v4. The updater contains a listing of changes that have been made. When you run it, your original ClarisWorks 2.0 is combined with the list of changes and is replaced with version 2.1v4.

System Requirements
If you are using System 6 you will need 2 Mb of RAM memory to perform the update. If you are using System 7 you will need 3 Mb of RAM.

Hard Disk Space
You will need approximately 2 Mb of free disk space to install and use the updater.

How the Update Works
Updating from ClarisWorks version 2.0 to 2.1v4 is a two step process. In Part I, you install the ClarisWorks 2.1v4 Updater and other necessary files. In Part II, you update the application file.

Part I - Installing the Updater

1. Double-click the ClarisWorks 2.0v1-->2.1v4 icon.
2. Click Continue.
3. Read the license agreement using the scroll arrows.
4. If you agree with the terms, click Agree to proceed with the installation.
5. Once the installation has succeeded, click OK and continue on to Part II.

The installer will have created a folder named "ClarisWorks 2.1v4 Update" on your startup disk and placed the ClarisWorks 2.1v4 Updater within it.

How the Updater Works
The updater will modify your current copy of ClarisWorks. This update will only work with ClarisWorks 2.0. You cannot update the same copy twice.

Part II - Updating the Application

1. Quit ClarisWorks, if you are using it.
2. Double-click the ClarisWorks 2.1v4 Update folder icon to open it.
3. Double-click the ClarisWorks 2.1v4 Updater to open it.
4. The updater will search for ClarisWorks. If the updater fails to find it, locate and select the copy of ClarisWorks 2.0 to be updated.
5. Click Update.
6. The update should take less than five minutes. You will see a message confirming successful installation of the new version, or an indication of what went wrong.

Congratulations, you have successfully updated to 2.1v4!

The ClarisWorks 2.1v4 Update folder also contains files named "New Features Guide" and "READ ME." Use them to take advantage of your new version of ClarisWorks.

NOTE TO MODEM USERS
A new version (1.5) of the Apple Modem Tool has been provided with your updated version of ClarisWorks. This version adds support for Apple's Newton MessagePad and includes diagrams of various modem cables. Apple has removed the listing of initialization strings for all non-Apple modems. The updater will not remove your existing Apple Modem Tool, but installs the new one alongside it in your System's Extensions folder (in the Communications Folder under System 6).

In a Communications document, you will now see both "Apple Modem Tool" and "Apple Modem Tool 1.5" in the list of available methods in the Connections Settings dialog box. Please note that if you are currently using an initialization string for a non-Apple modem, this string will be lost if you switch to the 1.5 version. For additional information on the Apple Modem Tool, please contact Apple Computer Technical Support at 1-800-SOS-APPL.

Files Installed by ClarisWorks 2.0v1-->2.1v4:

```
[ClarisWorks 2.1v4 Update]

ClarisWorks 2.1v4 Updater
New Features Guide
READ ME

[System Folder]
[Claris]
 [Claris Translators]
  AppleWorks
  ASCII
   ClarisWorks 1.0 Text
   DIF
   Microsoft Excel 3-4
   Microsoft Word 4-5
   SYLK
   ClarisWorks Labels
   US English - Hyphenation
[Extensions]
  Apple Modem Tool 1.5
```

Note: All installation must take place on the active system disk.

How to update ClarisWorks 2.1v1, 2.1v2 or 2.1v3 (ClarisWorks 2.1v1/v2/v3-->2.1v4):

Improvements
ClarisWorks 2.1v4 has several improvements over earlier versions of 2.1. A problem relating to printing unfilled polygons, bezigons, and freehand objects on Hewlett-Packard DeskWriter printers has been corrected. The "Better Text" and "Better Graphics" options have been restored to the Print dialog box when printing to an ImageWriter printer. Also, an alert message which sometimes inappropriately warns that a document uses fonts not installed in the system has been removed.

TA43050_About_Version_v_Macintosh_Updater_Read_Me.pdf

Overview
The updater contains a listing of changes that have been made between earlier versions of ClarisWorks 2.1 and 2.1v4. When you run it, your original ClarisWorks 2.1v1, 2.1v2, or 2.1v3 is combined with the list of changes and is replaced with version 2.1v4.

System Requirements
If you are using System 6 you will need 2 Mb of RAM memory to perform the update. If you are using System 7 you will need 3 Mb of RAM.

Hard Disk Space
You will need approximately 1 Mb of free disk space to use the updater.

How the Updater Works
The updater will modify your current copy of ClarisWorks. This update will only work with ClarisWorks 2.1v1, 2.1v2, or 2.1v3. You cannot update the same copy twice.

1. Quit ClarisWorks, if you are using it.
2. Copy the "ClarisWorks 2.1v1/v2/v3-->2.1v4" file into the same folder on your hard disk as your ClarisWorks application.
3. Double-click the ClarisWorks 2.1v1/v2/3-->2.1v4 updater to open it.
4. The updater will search for ClarisWorks. If the updater fails to find it, locate and select the copy of ClarisWorks 2.1 to be updated.
5. Click Update.
6. The update should take less than five minutes. You will see a message confirming successful installation of the new version, or an indication of what went wrong.

Congratulations, you have successfully updated to 2.1v4!

ClarisWorks Update License Agreement - U.S.

Portions of the software used to compress/decompress and install the files making up this software product are Copyright 1989-1993 Aladdin Systems, Inc. and Raymond Lau. The enclosed UpdateMaker updater program is Copyright 1993 by AD Instruments, Inc. Suite H, 2251 Grant Rd., Los Altos, CA 92024.

The software code changes contained within the updater, the original software, and the software created by the updater program are Copyright 1991-1994 Claris Corporation. All rights reserved. Claris and ClarisWorks are registered trademarks of Claris Corporation. All other trademarks are property of their respective owners.

License Agreement

PLEASE READ THIS DOCUMENT CAREFULLY PRIOR TO USING THIS SOFTWARE. IF YOU DO NOT AGREE TO ALL THE TERMS OF THIS LICENSE, DO NOT USE THE SOFTWARE AND EITHER DESTROY YOUR COPY OF THIS SOFTWARE OR RETURN THE PACKAGE TO THE PLACE WHERE YOU OBTAINED IT.

The enclosed computer program is an update (the "Update") to ClarisWorks 2.0 (the "Software"). In order to use and/or copy the Update as authorized by this License, you must have validly licensed at least one copy of the Software. You are required to have a validly licensed copy of the Software for each copy of the Update made hereunder. The Update and the copies authorized herein replace your validly licensed copies of the Software and are not additional copies (i.e., you may not use the Update in addition to the Software the Update is replacing).

TA43050_About_Version_v_Macintosh_Updater_Read_Me.pdf

The Update is licensed, not sold, to you by Claris Corporation ("Claris") for use only under the terms of this License, and Claris reserves any rights not expressly granted to you. You own the disk(s) on which the Update is recorded or fixed, but Claris and its licensers retain ownership of the Update itself.

1. License. This License allows you to (i) make copies of the Update, only up to the number of validly licensed copies of the Software in your possession and (ii) use each such authorized copy on a single computer at a time. You are required to have a validly licensed copy of the Software for each copy of the Update made hereunder. The Update and the copies authorized herein replace your validly licensed copies of the Software and are not additional copies. To "use" the Update means that the Update is either loaded in the temporary memory (i.e., RAM) of a computer or installed on the permanent memory of a computer (i.e., hard disk, CD ROM, etc.). You may use at one time as many copies of the Update as you have licenses for. You may install the Update on a common storage device shared by multiple computers, provided that if you have more computers having access to the common storage device than the number of licensed copies of the Update, you must have some software mechanism which locks-out any concurrent users in excess of the number of licensed copies of the Update (an additional License is not needed for the one copy of the Update stored on the common storage device accessed by multiple computers). If the Update is installed on the permanent memory of a single desktop computer (i.e., not a storage device shared by multiple computers) and that desktop computer is used by one individual for at least 80% of the time the computer is in use, that same individual may also use a copy of the Update on a portable or home computer.

The Update is protected by copyright law. As an express condition of this License, you must reproduce on each copy the Claris copyright notice and any other proprietary legends that were on the original copy supplied by Claris.

You may permanently transfer all your rights under this License to another party by providing to such party all copies of the Update licensed under this License, and the Software the Update replaces, together with a copy of this License and all written materials accompanying the Update, provided that the other party reads and agrees to accept the terms and conditions of this License.

2. Restrictions. The Update contains trade secrets in its human perceivable form and, to protect them, you may not REVERSE ENGINEER, DECOMPILE, DISASSEMBLE, OR OTHERWISE REDUCE THE UPDATE TO ANY HUMAN PERCEIVABLE FORM. YOU MAY NOT MODIFY, ADAPT, TRANSLATE, RENT, LEASE, LOAN, RESELL FOR PROFIT, OR CREATE DERIVATIVE WORKS BASED UPON THE UPDATE OR ANY PART THEREOF.

3. Termination. This License is effective until terminated. This License will terminate immediately without notice from Claris or judicial resolution if you fail to comply with any provision of this License. Upon such termination you must destroy the Update, all accompanying written materials, and all copies thereof. You may also terminate this License at any time by destroying the Update, all accompanying written materials and all copies thereof.

4. Export Law Assurances. You agree that neither the Update nor any direct product thereof is being or will be shipped, transferred or reexported, directly or indirectly, into any country prohibited by the United States Export Administration Act and the regulations thereunder or will be used for any purpose prohibited by the Act.

5. Limited Warranty and Disclaimer, Limitation of Remedies and Damages. YOU ACKNOWLEDGE THAT THE UPDATE MAY NOT SATISFY ALL YOUR REQUIREMENTS OR BE FREE FROM DEFECTS. CLARIS WARRANTS THE DISKETTES ON WHICH THE UPDATE IS RECORDED TO BE FREE FROM DEFECTS IN MATERIALS AND WORKMANSHIP UNDER NORMAL USE FOR 90 DAYS FROM PURCHASE, BUT THE UPDATE AND ACCOMPANYING WRITTEN MATERIALS ARE LICENSED "AS IS." ALL IMPLIED WARRANTIES AND CONDITIONS (INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE) ARE DISCLAIMED AS TO THE UPDATE AND ACCOMPANYING WRITTEN MATERIALS AND LIMITED TO 90 DAYS AS TO THE DISKETTES. YOUR EXCLUSIVE REMEDY FOR BREACH OF WARRANTY WILL BE THE REPLACEMENT OF THE DISKETTES OR REFUND OF THE PURCHASE PRICE. IN NO EVENT WILL CLARIS OR ITS DEVELOPERS, DIRECTORS, OFFICERS, EMPLOYEES OR AFFILIATES BE LIABLE TO YOU FOR ANY CONSEQUENTIAL, INCIDENTAL OR INDIRECT DAMAGES (INCLUDING DAMAGES FOR LOSS OF BUSINESS PROFITS, BUSINESS INTERRUPTION, LOSS OF BUSINESS INFORMATION, AND THE LIKE), WHETHER FORESEEABLE OR UNFORESEEABLE, ARISING OUT OF THE USE OF OR INABILITY TO USE THE UPDATE OR ACCOMPANYING WRITTEN MATERIALS, REGARDLESS OF THE BASIS OF THE CLAIM AND EVEN IF CLARIS OR AN AUTHORIZED CLARIS REPRESENTATIVE HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Claris' liability to you for actual damages for any cause whatsoever, and regardless of the form of the action, will be limited to the greater of $500 or the money paid for the Update that caused the damages.

THE ABOVE LIMITATIONS WILL NOT APPLY IN CASE OF PERSONAL INJURY ONLY WHERE AND TO THE EXTENT THAT APPLICABLE LAW REQUIRES SUCH LIABILITY. BECAUSE SOME JURISDICTIONS DO NOT ALLOW THE EXCLUSION OR LIMITATION OF IMPLIED WARRANTIES OR LIABILITY FOR CONSEQUENTIAL OR INCIDENTAL DAMAGES, THE ABOVE LIMITATIONS MAY NOT APPLY TO YOU.

6. General. This License will be construed under the laws of the State of California, except for that body of law dealing with conflicts of law. If any provision of this License shall be held by a court of competent jurisdiction to be contrary to law, that provision will be enforced to the maximum

extent permissible, and the remaining provisions of this License will remain in full force and effect. If you are a U.S. Government end-user, this License of the Update conveys only "RESTRICTED RIGHTS," and its use, disclosure and duplication are subject to Federal Acquisition Regulations, 52.227-7013 (c) (1) (ii). (See the U.S. Government Restricted provision in the user manual.)

AppleWorks 4.0 Word Processing Translation (WP)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
According to Quality Computers, who makes AppleWorks 4.0, Version 4.0 Word Processing documents have the same file format as AppleWorks 3.0.

This means that converting AppleWorks 4.0 files into ClarisWorks files should be no problem using the regular AppleWorks translator (provided with ClarisWorks), along with Apple File Exchange, or PC Exchange 2.0 which now handles ProDOS as well. PC Exchange 2.0 ships with system 7.5.

Decimal Differences When Showing Percent (%) in Slice of Pie Chart (SS)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There appears to be a problem with controlling the percentage shown in a Pie Chart.

For example, in either a ClarisWorks document or a ClarisImpact document, make a Pie Chart of the following data:

Apples 30
Oranges 40
Peaches 30

In the chart options, under Series, choose the option of Show Value, % in Slice (ClarisImpact) or Display Label Data, & in Slice (ClarisWorks).

Notice that the resulting chart shows 30.0% in some slices, but 40% (no decimal point) in the other. This is reproduceable in versions of ClarisWorks from 1.x through and including 2.1v3 and in ClarisImpact through 1.0v3. Claris development is aware of the problem.

ClarisWorks 2.0: The View from Publish & Subscribe

Support for Publish & Subscribe feature gives the desktop publisher more options and flexibility.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

ClarisWorks 2.0 provides you with features and options you need to create high-quality documents. This article examines solutions that use ClarisWorks Publish & Subscribe as well as its most versatile feature: Frames.

Publish & Subscribe

Publish & Subscribe is designed to make it easier to share information with other documents and applications. You must be running Apple System 7 in order to take full advantage of Publish & Subscribe, but if you are currently running System 6, you can use the shared data but you cannot send and automatically receive updates, as you can with System 7.

Publish & Subscribe is "live" copying and pasting of information from one document or application to another, so that when you change information in one place, it automatically changes in the other. When you use Publish & Subscribe, the information is in three places: The publisher, the edition, and the subscriber. The original source document publishes an edition file of the selected data, and the secondary document subscribes to the edition file - "pasting" the published data into the document that subscribed to it. The link is maintained even if any of the files involved are moved, renamed, or closed.

Key features of P&S

You have the ability to publish or subscribe files over a network. The source files can actually be located on several different Macs, and the subscribers will update automatically whenever a publisher "saves" a change in the published document. Because publishers and subscribers are linked by the edition file, the link is maintained whether the files are renamed, moved or closed. This has some useful implications as far as usage goes. These are as follows. Using P&S saves disk space. An edition file is created with only selected data, not necessarily the entire file. This means that you can subscribe to a chart created with a relatively large spreadsheet, without having to subscribe to the entire spreadsheet file. Several subscribers can subscribe to the same edition. P&S thereby transparently supports workgroup production of documents.

If an application can publish an edition, then any other application that can subscribe can use it.

P&S has some usage limitations that may effect the planning of your document design and production. P&S will not

* Modify or edit subscriber data beyond formatting.
* Do irregular text wrap.
* Adjust network access to avoid network traffic or slow processing.
* Publish or subscribe to any graphic format other than PICT.

When to use P&S

Imagine you want to publish a weekly newsletter that consists of some articles, a chart, and pictures. You decide to use P&S, knowing that the creation of the elements of the newsletter can be delegated, so you inform the perspective sources of the articles, chart, and photos to publish edition files of their work and save them to a convenient location on your network (like a local server or a shared folder). You can simply open a new document and subscribe to those editions: With a little formatting, you have a newsletter.

When to use frames

While Publish & Subscribe provides a means to bring together data from various applications or documents, frames allow you to produce complex documents from within the same application. Use Frames to generate your entire newsletter. Frames allow you to integrate or combine different ClarisWorks application environments in a single document. Scan photos and insert graphics files into your document. In the same document, you create a spreadsheet frame and produce charts. Create text frames - taking advantage of the outline feature to organize ideas for articles. Within the same document, create a paint frame to produce a logo for your new publication.

You can move, resize, and change the appearance of frames. By clicking into a frame, you enter its application environment, and have access to the tools and commands in that environment. When you save a document that contains one or more frames, ClarisWorks stores each frame and its contents as part of that document.

The integration between word processing, database, spreadsheet, drawing, painting and communications environments is the power of using frames. This integration allows you to have complete control from within any ClarisWorks document over formatting the contents of frames. Elements such as irregular text wrapping in a drawing frame, combined with spreadsheet data in a spreadsheet frame can each be edited from the same document. In addition, frames themselves can be published to other documents entirely or in part.

Can P&S and Frames Be Used Simultaneously?

Returning to the newsletter example, once you create a single newsletter document, you discover that a new, larger document needs to be

produced at a different location. This other larger document requires some or all of the same data of the original newsletter. The original newsletter was produced entirely with frames, but now you publish editions of several sections of the newsletter in the larger document. The larger document may consist of frames as well as subscribers generated by several different documents.

When an edition file needs updating but the person who created it is unavailable, you can subscribe to an edition file of text, for example. You can then select the text, copy it, and paste it into a text frame. You can edit or update this selected text from within its frame.

Using Publish & Subscribe in combination with frames allows you to combine features of each to get the most out of ClarisWorks. Frames, for example, are geared toward the single user, whose entire document production may occur right on the single desktop. Use only frames in your document production when you are creating documents whose basis is a "snap shot" or time slice of data that does not need to be updated. This data can be drawings or pictures, like a map, that change little or not at all over time. Use Publish and Subscribe in combination with frames for tasks that involve dynamic (changing) data to open up your document production and organization to an environment where information may be shared, managed, and updated in workgroup situations or other situations that require you to use a separate data source in whole or in part.

-40 Error Opening WinWord 2.0 Files Saved From WinWord 6.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you create a document in the WinWord 6.0 application and use the Save As command to save the file in the WinWord 2.0 format, the ClarisWorks WinWord translator will generate a -40 error when trying to open the file.

This only occurs if you save a WinWord 2.0 file from WinWord 6.0. If the original document is created in WinWord 2.0, it will be translate correctly into ClarisWorks 2.1. Also, if a document is created in WinWord 6.0, saved in WinWord 2.0 format, opened into the WinWord 2.0 application and saved, it will convert properly into ClarisWorks 2.1.

This article has been archived and is no longer updated by Apple.
If you are using ClarisImpact 1.0, and find that your chart legend is covering part of your chart information, try the following:

With your chart frame selected (there will be small, black, square selection handles on each corner) choose Legend & Title... from the Chart menu. In the Show Legend portion of the window that appears, make sure that both Overlay Hor. and Overlay Ver. are not checked. If they are both checked, the chart will stretch to be as wide and tall as possible in its window, and the legend may overlap part of the chart information.

This is also true for the Title.

ClarisImpact: STR 128 Error with Updater

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

The ClarisImpact Updaters were developed to bring previous versions of ClarisImpact up to the current version. The updater will currently function only with United States, single-use versions of the software. Site Licensed customers must receive a new disk set to update their licensees.

When running the ClarisImpact 1.0v2 or 1.0v3 Updater, the following error message may be seen: "Could not update ClarisImpact because it is not the file that this updater was designed for - the STR 128 is different". This message could be in error.

If you are running a U.S. single-use ClarisImpact, do the following: Run the ClarisImpact Installer, and select the "Customize" button. Select the "ClarisImpact Application" custom install option, then click "Install." When installation is complete, run the updater on the newly installed version.

STR 128 contains the current styles directory name. The only way this resource gets changed is when the "ClarisImpact w/B&W Styles " custom installer option is used. Installing a new application installs ClarisImpact with the default resource string "ClarisImpact Color Styles" which is the string expected by the updater.

Note: This is the same for both the 1.0v2 and 1.0v3 updaters.

Creating a Dashed Polygon

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisDraw can apply dashes only to a line. Following are the steps to create a dashed polygon. Please note that an object created with this workaround cannot easily be filled with a color or pattern.

1. Double-click on the Line tool so that it is locked (it will turn a darker gray when locked).

2. Choose Guideliner in the Layout menu so that it has a checkmark next to it.

3. Draw the first side of your polygon.

4. When drawing subsequent sides of your polygon allow the Guideliner to locate the end of the previous side (indicated by a plus sign) so you can connect the sides easily.

5. When all of the sides are done, select all the lines (drawing a selection rectangle around the lines instead of using the Shift key will be easiest).

Note: When selection handles overlap, they disappear. In this example, when all the lines are selected none of the selection handles will show.

If you do not need to fill the polygon with a color or pattern, use this step:

6. With the lines selected, choose dashed from the Line Styles menu (located on the horizontal tool bar) and choose Group from the Arrange menu.

You will be able to resize and change the pen color of the object you have just created, but you will not be able to fill it with a color or pattern.

If you need to fill the polygon with a color, use these steps:

1. With the lines selected, choose Copy from the Edit menu, create a Paint Frame large enough to contain the object and Paste. You will see your object in the Paint Frame.

2. While still in the Paint Frame, fill the inside of the polygon with the color you want and fill the rest of the Paint Frame outside the polygon with black. Now change the black to white. (This step is used to eliminate the Pen color of the object while creating a Fill color.)

3. Click to select the Paint Frame with the Arrow tool and choose a transparent Fill and Pen color so that the Frame border and background disappear.

4. Move the Paint Frame to behind the polygon that you first drew by using the Move to Back command from the Arrange menu. Next, move the Paint Frame so it is directly underneath the drawn version of your Polygon (the Arrow keys on the keyboard allow you to move the object in small increments for precise alignment).

5. Select your drawn lines, choose dashed from the Line Styles menu (located on the horizontal tool bar) and choose Group from the Arrange menu.

6. Select the Paint Frame and the drawn objects and group them.

ClarisImpact: Documentation Error Notes

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Page 13-5 of the ClarisImpact User's Guide states that it is possible to change the "border, color, and fill, and add a drop shadow using the tools on the style bar" while a Note is selected.

However, changing these attributes for a Note is not possible. When attempting to change one of these attributes in the manner described ClarisImpact will simply beep at you.

You can change the size and text color of a note.

The Publications Department is aware of the the issue.

ClarisDraw 1.0: Opening CGM Files

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

ClarisDraw 1.0 ships with a CGM filter. CGM is a file format commonly used on Windows machines. If you need to open a CGM file, be aware that ClarisDraw will not be able to open the file based solely on the file's three-digit extension - you will need to edit the file's file type code manually using Norton Utilities, ResEdit, or some other utility. The file type for a CGM file should be "CGMF".

ClarisDraw 1.0v1: Pasted Polygons and Bezigons Do Not Print

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Polygons and bezigons drawn in ClarisDraw 1.0v1, then copied and pasted to Microsoft Word, do not Preview or Print when you are using the HP DeskWriter 5.0 driver.

This has been fixed in ClarisDraw 1.0v2.

The best workaround is to use Save As... to save your ClarisDraw file in the PICT or EPSF format, then use the Microsoft Word Insert Picture command to place that picture in the desired location in your Word document.

ClarisImpact 1.0v4: "Font not Installed in System" Message

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There is a difference between the fonts which are installed with ClarisImpact 1.0v3 or earlier, and those which are installed with ClarisImpact 1.0v4.

If you have previously installed ClarisImpact 1.0v3, and update the application to 1.0v4 (via updater or through a custom installation), but do not update the fonts which are installed, your documents will use the 1.0v3 font information without any problem. When you open and save the files, using the 1.0v3 font information, in ClarisImpact 1.0v4, the files are assigned to those fonts.

However, if you then replace the ClarisImpact 1.0v3 fonts with the newer ClarisImpact 1.0v4 fonts, the files do not convert the font information to the new fonts. Basically, the document will continue to try to address the old font information.

What will happen on your machine? ClarisImpact will react as though you have a font in your document that is not currently installed in your system. You will see a "Font not Installed in System" alert when you open your old documents, and the fonts in those documents will display and print in Geneva.

Fortunately, there is an easy workaround. Open and save the files in 1.0v3, and then open them in 1.0v4. The font conversion will then work properly. Note that any new files that were created in 1.0v4 with the 1.0v4 fonts would work perfectly.

ClarisImpact: Communication Ideas & Tips

With the ClarisImpact intelligent tools, your visual communication gets a productivity boost with professional-looking results. Here's an overview and some tips.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

When I first saw it, my eyes bugged out. I knew that I had to get this product. I didn't even know what it was called, but I just knew that I had to have it. Watching the ClarisImpact software demonstration made me think of all those times I struggled to get my point across graphically, using charts, slides and clip art. Since the inception of the Apple Macintosh ten years ago, we have all been communicating graphically, mixing fonts and typefaces, drawing boxes and lines on a page. Never before has it ever been this easy to communicate visually. But as easy as the Macintosh has been all these years, creating visually compelling documents has still required some kind of know-how or talent. The sad truth is that even if you had a state-of-the art machine, top-of-the-line software, you could still create documents or reports that nobody cared about. Good visual communication and presentation will always depend on a four basic elements, according to the author of Looking Good in Print, Roger C. Parker:

* a willingness to experiment
* confidence in your perceptions
* recognizing that effective design is a process, not an event
* devotion to detail

These four elements are deceptively simple. I am not a visual artist; but I, like most people, do know what I like-that just about sums up my sense of design. After that, I'm a little at sea, and don't exactly trust my perceptions enough to experiment. But ClarisImpact makes all that goes into creating effective design different and fun.

The content of your message vs. the way it looks

Previously, good design was in the realm of professional designers, neither hardware nor software dependent. But, now, with a tool like ClarisImpact to get you started, you can build your confidence in your own sense of good design, and produce visually compelling documents right away. ClarisImpact is based on the concept of object models of visual communication and the elements associated with these models. For example, the models that are available to you from the ClarisImpact report, drawing and presentation documents are outlines, tables, data charts, organization charts, flow charts, calendars and time lines. To help you with your creations, ClarisImpact comes with predefined model styles that reflect a devotion to detail, confidence and consistency in design that was all taken care of in advance by professional designers. You don't have to think about these design elements, unless you would like to create your own styles later on, which ClarisImpact also allows you to do for each model. But at the onset, you can't go wrong for trying your hand at creating a calendar, organization chart or time line. Your first ventures into the ClarisImpact design environment get results right away, so you can easily concentrate on getting your message across.

ClarisImpact in action

ClarisImpact has three types of documents, a powerful drawing type, a word processor, which is very similar to the word processor in the popular program ClarisWorks integrated software environment, and a presentation type. Each type of document has powerful new features; and, as with all Claris products, they have the clear interface that makes for an easy learning curve.

The new ClarisImpact intelligent tools, called models, make the creation of certain kinds of graphics very easy. For example, as shown in Figure 1, bar charts can be edited, created and presented in a variety of styles-without leaving the charting environment. The chart in Figure 1 shows data that has been entered into a ClarisImpact table. The table and chart are intelligently linked: you can create and store your own styles or use any of the twelve preset styles of data charts that ship with ClarisImpact, so that you can format and present the data according to your presentation needs. In addition, if you would like to separate the data table and generate additional charts from the same tabular data, you choose Separate Table from the Chart menu. If you need to edit the table values, there is no need to leave the chart format to go to the table; you can click on the element that needs to be changed and start entering the new data right away, right in chart mode. The table is linked to the chart in such a way that you can choose to hide or show the table.

Similarly, if you wanted to draw an organizational chart, before ClarisImpact, you either had to draw it in a drawing program, which could take hours, or you could buy and learn a program that did nothing but organization charts.

With the ClarisImpact OrgChart tool, you can select from many styles, such as the Basic, Informal or International styles, or you can make your own. Once you have selected the style, the chart is made for you and all you have to do is type in the names and positions. Adding or deleting positions can be done with a single click, and the ClarisImpact drag and drop technology allows you to reposition individuals or reorganize entire branches very quickly: simply select the branch of the organization chart, drag it to its new location and release the mouse. It couldn't be much easier.

Along with this ease of use comes tremendous flexibility. You can create your own styles for the organization chart or for each position within the chart. You can use the drawing tools to draw them, or you can use any of the thousands of pieces of Claris Clip Art that is included with the program-you can even make each position in that organization chart a QuickTime movie of the person represented!

Lest you think that ClarisImpact is a program strictly for drawing Organization Charts and presenting tabular data, you should know that there are four other models: Outlines, Flow Charts, Tables, Timelines and Calendars. When you create one of these models, you can rely on the appropriate menu to appear always in the same position in your menu bar no matter what kind of model you are editing, so you don't have to think about the organization of your menus and commands.

Each of these models comes with similar Model Styles, so when you find the one that you like, you can use that same style in each type of model that you create, giving your documents a uniform, professionally designed look. Of course, if you are creatively inclined, you can make your own matching style for each model. Smartness is built into ClarisImpact, in its editability and drawing features. There are smart Connectors (lines that stay "attached" to objects no matter where you move them), a PointGuide tool, which finds points on an object automatically, SmartAlign tool, which keeps objects aligned when you move any one of them, the ability to edit objects in a group without ungrouping, and special Shape tools, which draw tools like stars, arrows, boxes and speech balloons.

In addition, there are features such as Text Styles; editable Drop Shadows, colors and gradients; Bezigons (for drawing shapes with precise connected curves); zooming up to 3200% in hundredth of a percent increments; Claris XTND translator technology; 256 text colors; and regular and irregular text wrap around objects. Each of these features, along with the seven kinds of models, is available in the drawing, word processing and presentation documents.

Because each of the ClarisImpact models is so adaptable, there is no limit to what you can do with each type of document. For example, educators who take great pains to produce calendars, can produce sophisticated results in a matter of minutes, such as that in Figure 2, which takes advantage of the various element styles available for calendar models. Educators will also want to use its integration of tables and charts into the word processor to write grant proposals, lesson plans and reports whose designs can easily transfer for use in educational materials or tests. ClarisImpact is great for writing tutorials. Use the presentation type document to make presentations that outline and step through a procedure, with QuickTime movies or charts that illustrate each step or procedure. You can set up a presentation to advance slides automatically, or set it up to advance slides manually. ClarisImpact presentations can build each item of an outline progressively, adding clarity and effect for each item.

Building on the idea of an automated presentation, a creative use for ClarisImpact presentations is the informational kiosk. The idea is to have a ready-made presentation, which sits on the hard drive of your machine. You put the machine somewhere where numbers of people can view your presentation, which you set to loop continuously. After starting up your presentation, you remove the input devices, the mouse and keyboard, so that your machine is merely a monitor displaying information. When you want to remove the kiosk or change the display, just plug the mouse and keyboard back in and make your changes.

Like other Claris products, the ClarisImpact tools will help you solve day-to-day puzzles that present themselves as opportunities to test, not just your tools, but your creativity as well. ClarisImpact will also help you make the best use of your investment in your Macintosh computer, whose future began with desktop publishing. The standards for visual communication have never been the same since. In the same vein, color printers are coming down in price. This too will affect the way you think about visual communication. People will now expect to see color or pictures in your documents and presentations. Rise to the occasion with impact.

TIPS

Creating and saving model styles
A model style holds format options for an entire modelÑthe associated chart type, element colors, text settings, layout-so that related information gets presented in one style, remaining consistent and logically organized. Model styles are stored in a separate file, so that you can create your own model styles or modify and rename or delete the model styles that come with ClarisImpact. The rule of thumb to remember is dialog boxes: changes made to a model within a dialog box are saved with the model style. For example, if you select a Connector in your organization chart model, then click the pen color icon, that change will not be saved. But if you go to the Connectors... menu from Connector Settings, a dialog box will appear and when you make your changes there, the changes will be saved with the model style.

To add a Model Style after having created a model you would like to use again:

1. Select the model.
2. Go to the Model Menu and select model styles. Click the Add button. This will create a Model Style.

ClarisImpact keyboard and mouse combinations
Other keyboard and mouse combinations are covered in the Quick Reference card included with your software. Try these shortcuts:

* Hold down the Shift key while clicking on an object and the object(s) previously selected will remain selected.

* Hold down the Command key while dragging an object and the outline of the object will be more accurately represented.

* Hold down the Option key while dragging an object and the object will be duplicated.

* Holding down the Shift key while resizing an object allows proportional resizing.

* Holding down the Option key while resizing an object will resize all sides at once. When drawing, an object will draw from its center (the exception is stop sign tool).

* Hold down the Shift and Option keys while resizing an object and all sides of the object will be resized proportionately. You can also use this keyboard combination when drawing an object.

Figure 1: Charting options for a table that you can show or hide. Once you create the table, you have a variety of charting options and powerful editing capabilities. Clicking on the "crossed-out" icon at the bottom of the table will hide the table.

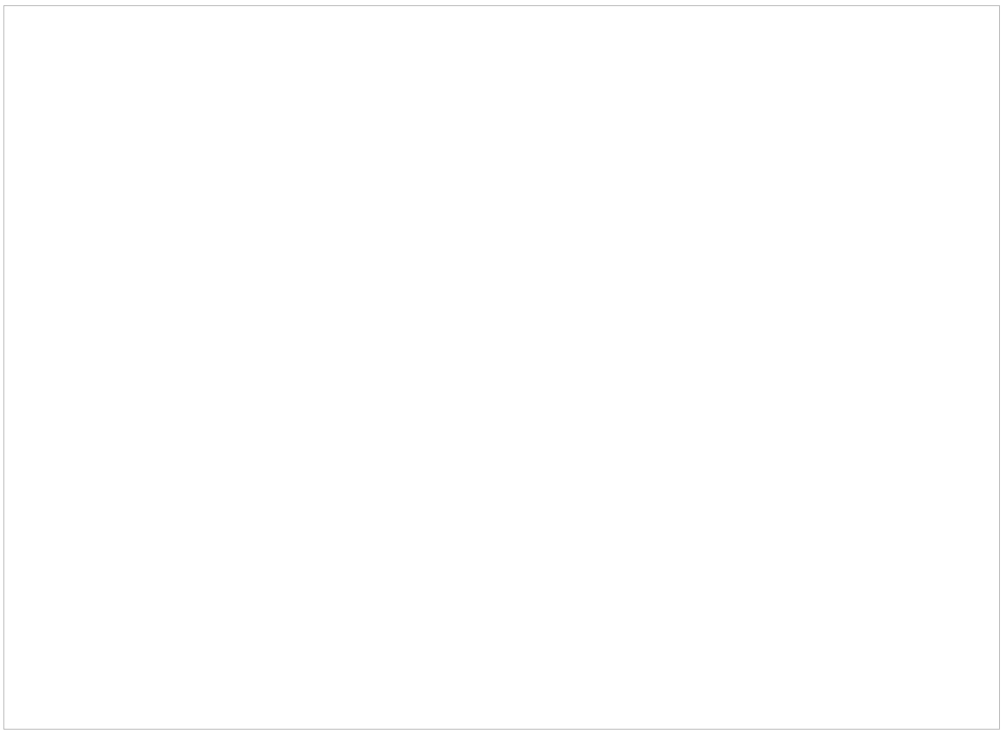

Figure 2: Element styles are used to set the individual parts of models. Above, a calendar model has an element style applied to two of its days to accent the vacation banner, a marker that spans several days.

Resizing Groups of Rotated Polygons Can Cause Unexpected Results

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you group rectangles or regular polygons that have been rotated, then resize the group, the objects in the group may appear to resize in unexpected ways. This is because the program stores data about objects in their non-rotated state.

To see this easily, create two groups of rectangles. For group 1, create a rectangle 1x3 inches and another 3x1 inches (one short and fat, the other tall and skinny), select the two rectangles, and choose Group from the Arrange menu. For group 2, create a rectangle 1x3 inches. With the rectangle selected, choose Duplicate from the Edit menu. Choose Rotate from the Arrange menu and rotate the second rectangle 90 degrees. Align the bottom edge of the two rectangles, select them both , and choose Group from the Arrange menu. The goal is to have two groups that look identical, but only one which contains a rotated object.

Click on group 1 and expand it to be twice as tall. Both objects in the group should expand vertically, becoming twice as tall as they were originally. Now select group 2 and do the same procedure. Notice that the rotated object expands along the axis that was vertical before it was rotated. That is, it gets wider rather than taller.

In order to have rotated regular polygons resize properly, you must get the program to recognize their rotated position as their original position. To do this, follow the procedure below for the program you are using.

For Claris CAD

1) Select the group containing the rotated polygons and choose Ungroup from the Arrange menu.

For each polygon..

2) Select the polygon
3) Choose Unjoin from the Arrange menu
4) Immediately choose Join from the Arrange menu

After doing this to each rotated polygon, you may reselect all desired objects and regroup them.

For MacDraw II and MacDraw Pro

Save the file as PICT then reopen it. In opening the PICT file MacDraw II and MacDraw Pro will take the rotated position of all polygons as their starting orientation, and they will resize correctly.

Check the alignment of objects and text to be sure that they have not shifted when the file was saved to PICT.

Objects Will Not Fit Within Document Boundaries

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you rotate an object in ClarisDraw, copy it, then paste it into ClarisCAD, ClarisCAD will generate a message that the objects will not fit within document boundaries.

The best workaround is to save your document as PICT or EPSF from ClarisDraw and use the Place File command in ClarisCAD to bring in that graphic.

ClarisDraw 1.0v1: Problem Converting from MacDraw Pro

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There is a known problem with converting files created in MacDraw Pro into ClarisDraw 1.0v1 for the Power Macintosh. Any objects created with the polygon, bezigon or freehand tools will not print to a LaserWriter, even though they look fine on the screen. This is reproducible using LaserWriter Driver version 7.1.2 and 8.1.1 (and probably others).

This has been fixed in ClarisDraw 1.0v2. Any documents already converted from MacDraw Pro to ClarisDraw 1.0v1 for the Power Macintosh will be fixed by saving them out in MacDraw Pro format (thereby retaining any changes made) then reopening them in ClarisDraw 1.0v2 for the Power Macintosh.

Suggested workarounds for ClarisDraw 1.0v1:

1) Within ClarisDraw for the Power Macintosh, save the non-printing file as another format (MacDraw Pro or MacDraw II). Reopen the resulting MacDraw Pro/II file with ClarisDraw Native and it should print fine.

or

2) Print to a non-PostScript printer, such as a StyleWriter or DeskWriter.

or

3) Convert the MacDraw Pro files using ClarisDraw on a Macintosh other than a Power Macintosh. Once saved using ClarisDraw, the file can be opened with Native ClarisDraw on a Power Macintosh and printed successfully.

or

3) Use the Custom Installation feature to install non-native ClarisDraw onto a Power Macintosh. Use this non-native version to convert MacDraw Pro files. As in suggestion 3 above, once the files are converted and saved using the non-native version, they can be successfully printed from the PowerPC native version ClarisDraw.

A Task Cannot be Printed with All Attached Notes

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you create a Task, you may want to give more detail for the Task than is possible in the single line title provided in the Task dialog. While you recognize the Note as an expansion of the Task details, Claris Organizer sees Tasks and Notes as separate lists. You may print out your Notes or your Tasks, but not both together.

If you leave the title of each Task as part of the Note Title, and you make sure the date and time of the Note matches the date and time of the Task, a printed list of your Notes will be in the same order as your tasks. If you assign the category "Task/Notes" to both the tasks and notes, and find that category for both Task and Note lists, your printed lists will be relatively easy to match and read.
Published Date: Feb 18, 2012

Task List Headings Truncated

Sometimes when I print, the Task List heading seems to be truncated. What could cause this?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If a font size larger than 24 point is selected when printing a Task List, the headings may be truncated.

Follow these steps to recreate:
1. Launch Claris Organizer
2. Select Task from the Create menu
3. Press OK
4. Choose Print from the File menu and select Task List
5. Press Edit
6. Select all listed items to print
7. Ensure "Reduce to fit" and "Smart truncation" are selected
8. Type "25" in the font size field
9. Press Print - Notice headings have been truncated

ClarisWorks: Converting a Database From 68K Macintosh to Power Macintosh

When moving from a non-Power Macintosh version of ClarisWorks to a Power Macintosh version, be aware of some numerical precision issues. This article describes the issues further.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

There is a problem with number and date fields of databases that have been created on a 68K Macintosh with ClarisWorks 2.x software, then opened on a PowerMacintosh running the native "Accelerated for PowerMacintosh" ClarisWorks 2.1v3 (PPC) application.

The problem has been recreated with number fields that have been defined as a pre-defined input list as well as auto-enter serial numbers.

Symptoms
One example of the problem may be something like this:

Pre-defined list on 68K Macintosh with the values defined as follows:
1
2
3
4

After opening the same file containing the above field on a PowerMacintosh using the native, "Accelerated for PowerMacintosh" version of ClarisWorks 2.1v3, the pre-defined list has been converted to:
1.96875
3.476784003707e-310
5.305232320559e-315
8.095265607109e-320

Again, similar results occur with number fields that are are formatted with the auto-enter option where incrementing by 1 will convert to incrementing by 1.96875.

The inconsistency has also been reported with date fields. When a database file was opened with ClarisWorks PPC running native, the dates in the date field had changed. When the database was opened with non-native ClarisWorks, the dates went back to normal.

Workaround
1. If you see this behavior, close the file immediately without saving changes. (Note, even if you've already saved changes, the following steps may work)
2. Install the 68K version of ClarisWorks 2.1v3 on the Power Macintosh using the installer's Custom install option.
3. Delete or avoid using the Power Macintosh version of ClarisWorks for use with databases.
4. Opening the database with the non-native, 68K version of ClarisWorks will work fine. (TIP: Keep the 68k version, or an alias thereof, on the desktop so your database files can be dragged and dropped over the non-native version of the program to open them.

Claris Engineering is aware of the problem.

ClarisDraw: Description

The next generation of drawing software is faster and easier to use than ever before.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

New ClarisDraw software is here! The successor to the MacDraw Pro drawing environment, the best-selling Macintosh graphics application, brings new speed, clarity and intelligence to Macintosh graphics-on both Apple 680X0 Macintosh and Power Macintosh machines.

MacDraw Pro has been popular with "graphics generalists"-those whose graphics needs include the most popular business and home uses like line technical, diagrams, maps, floor plans, flyers, overhead slides, free-form graphics-because of its powerful features, which have always been easy to use. Even novice users became productive in very little time. ClarisDraw takes the "Simply powerful software" tradition one step further with performance boosts and new, intelligent features that make your drawings more dramatic, yet even quicker and easier to create.

For starters, the SmartConnector feature from ClarisDraw allows you to draw lines connecting boxes or other objects and have these lines remain perfectly connected. The SmartAlign and SmartSize features automatically maintain alignment, size and spacing between objects, even if you move or resize them.

Two more features provide one-click access to popular visual effects that used to take several steps to create. For a professional-looking drop shadow behind any object, simply click the object, then the SmartShadow button. The SmartEmbossing feature provides a dramatic embossing effect with similar ease.

ClarisDraw assists you during every phase of your drawing. The PointGuide and Guideliner tools help you draw, place, size, and move your objects correctly. PointGuide changes the appearance of the cursor to help you locate an object's corners, midpoints and centers. Guideliner provides an instantaneous "T-square" on your screen, allowing you to see how new objects-or objects being moved-relate to existing ones. There's also a floating object information palette, which gives information on any object's location, size, and angle of rotation. You can even type values directly into this palette, making high precision a snap.

ClarisDraw ships with the SmartSymbol library, a set of more than 2,400 high-resolution, professionally-designed maps, figures, symbols, engineering and architectural art, in both color and monochrome. To add a library object to your drawing, simply open the library and drag the object into your document. By using SmartSymbol objects, it's possible to have a quality, finished drawing in only minutes.

If you've duplicated library objects (called "clones") in your document, then you decide to change them, there's no need to edit each one separately. The ClarisDraw Replace Clones feature allows you to change one clone, then modify the rest based on the changes you made to the first.

Text handling is another ClarisDraw strong point. The easy-to-use Bind Text feature allows text to follow the shape of any object-no need for complicated and expensive applications to perform this special effect. Simply create the object and text, select them both, and choose "Bind Text" from a menu. And it's done. And you can easily experiment with a variety of bind text settings until you find the effect you're looking for.

The ClarisDraw Convert to Bezigons feature also adds sizzle to your drawings. With it, any object, including text, can be converted to bezigons for an almost limitless variety of special effects. For example, once converted to bezigons, a block of text (either as a group or each letter separately) can be resized, distorted or reshaped, or filled with colors, patterns or gradients.

Page layouts were a popular application for MacDraw Pro. ClarisDraw makes them even easier with several new text-handling features. You can wrap text around any object, with either regular, smoothly-justified wrapping or "irregular" wrapping. (See Figure 1.) You can also link frames so text flows from column to column and page to page. There's no longer a need to manually move text from one frame to another as it's being edited. ClarisDraw also has a Text Styles feature, allowing you easy access to frequently-used combinations of font, size, style and text color. You can name these styles, and access them with a single click from a pop up menu.

A quick tour

What's it like to see ClarisDraw in action? Let's say you have just a few graphic elements, and you want to pull them together in a way that will attract immediate attention. Starting with a new ClarisDraw document, use the text tool to drag out a couple of linked text frames. You can easily adjust the zoom controls so you can see the entire document on your screen. Once you have the linked text frames the way you want them, select "Place File" from the File menu to import your text. Since ClarisDraw supports XTND translation technology, there are numerous word processing file formats to choose from, including the ClarisWorks, MacWrite II, Microsoft Word, T/Maker's WriteNow, and other formats.

Once the text has been placed, arrange and format it as you like-use text styles to store fonts, styles and text colors, making formatting as easy as point and click. Next, import a picture into your page layout, and set the text to wrap around it: just click on the objects and choose "Wrap Text" from the Text menu. The Alignment palette helps align the text and graphic objects precisely; the Object Info palette lets you enter precise

dimensions for every object's size and placement.

Type some more text, select it and the picture you just imported, then choose "Bind Text to Object" from the Text menu. The text instantly binds to the picture's edge. The "Bind Text Options" settings box lets you fine tune how the text binds. Finally, for a magnificent headline, type a bit more text, select it, then choose "Convert to Bezigons" from the Arrange menu. Now that the text is bezigon objects, you can move and stretch it any way you like-even apply a gradient. Check the clock: in only a few minutes, you've completed a page layout that looks professionally finished!

ClarisDraw brings a new array of drawing tools to the veteran MacDraw Pro fan. In addition, the ClarisDraw painting tools will open a new world. Creating images by painting offers an alternative when drawing tools just won't do the job. Painting is also the method of choice if you need to edit scans, photographs or other bitmapped images. ClarisDraw handles these tasks with ease-and you can incorporate the edited image into the finished document. Other full-color painting features include a customizable paintbrush and spray can, as well as transformation effects such as tint, distortion, crop, blend, shade and perspective.

For the page layout we were just working on, you could take a scanned photograph, insert it into a paint frame, and add artistic transformation effects (See Figure 2). Once the photo looks the way you want, simply copy and paste it to your layout.

Sharing files

Creating a magnificent drawing is one thing. Being able to share it is another. Because ClarisDraw supports XTND, numerous graphics formats, including MacDraw Pro, MacDraw II, ClarisImpact , EPSF, PICT, CGM, TIFF, and more, are supported for both import and export. It's a snap to open your MacDraw II or MacDraw Pro documents in ClarisDraw and save them back out in either format.

When ClarisDraw for Windows ships in 1995, both Macintosh and Windows versions will have the same file format. Sharing graphics files between Macintosh and Windows machines will never be a headache again! Even more importantly, since both versions will be identical, businesses will only have to support one product. That's no small point-support is a far bigger cost for businesses than the actual unit cost of software, so the potential for savings is considerable.

ClarisDraw is a worthy successor to MacDraw Pro; its new features, speed and usability make it the software of choice for those who need to get their graphics done quickly, easily and professionally.

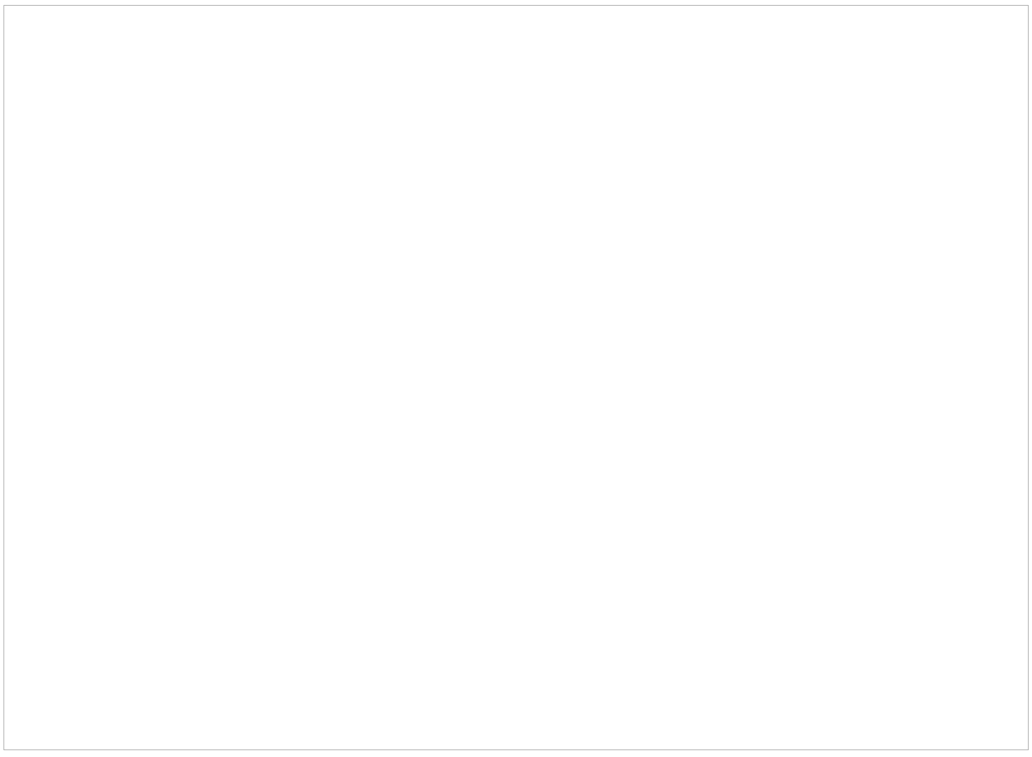

Figure 1. The ClarisDraw feature you wonder how you ever lived without-Text on a curve!

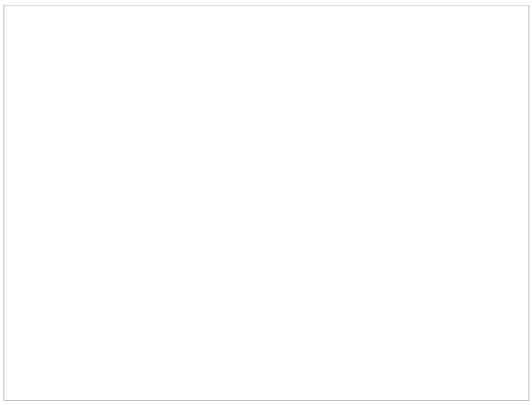

Figure 2. Experiment with features such as painting and superior text handling to create unforgettable results.

ClarisWorks: Gas Mileage in a Spreadsheet

This article contains a ClarisWorks spreadsheet solution for your everyday needs of tracking a car's gas mileage.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

What was ClarisWorks software designed to do? It wasn't exactly meant to perform a single task. For example, let's say you want to track the gas mileage of your T-Bird. Suppose you have a budget for gasoline, and you want to make sure you're maximizing the miles you get per gallon. How could ClarisWorks help you do this?

Consider using the ClarisWorks spreadsheet. Here's what it might look like once you've collected some data. (See Figure 1.)

The basic design

In row one, whose entries are in bold text, you keep track of totals-how much money have you spent on gas, how many gallons, how many miles did you drive for your money, over how many days.

Row two of this spreadsheet displays your averages, the average cost of a full tank, the average gallons you get for a full tank, the miles, the miles per gallon, as well as the average cents you paid per mile, the average dollars you paid per gallon, and the average dollars paid per day for gas.

In row three, the headings of the collected data are displayed. Putting the headings here lets them serve as headings for totals and averages, above, and for data, below, at the same time.

In addition to the totals and averages generated in rows one and two, rows five and on show you the daily breakdown of the data you collect. You can see the miles that you drove between full tanks, the days between filling up, the daily miles per gallon, etc.

Set up

Once you've outlined the basic design of your spreadsheet, it's time to make it work. To set up the spreadsheet in this example, follow these steps.

Set up the totals and averages first.

1. Open ClarisWorks and create a spreadsheet document. Under the Views menu, choose Show Tools.

2. Go to the cell where you want your first total, the total of money paid for gas, to display. In Figure 2, which displays the row and column headings of this spreadsheet, the cell reference is C1 and the value it contains in the example is $159.

3. Enter the following formula:

=SUM(C4..C38)

The rest of the formulas are created in the same way. In particular, for averages and totals, the formulas are (Note: For clarity, annotations appear in brackets [] and are not part of the formula you type in a cell):

Totals:
E1=SUM(E4..E38) [Total gallons]
G1=SUM(G4..G38) [Total miles]
H1=SUM(H4..H38) [Total days]

Averages:
C2=IF(C5<1,"", AVERAGE(C5..C38))
[Average amount paid per full tank]

E2=IF(C5<1.'"', AVERAGE(E5..E38))
[Average gallons per visit]

G2=AVERAGE(G5..G38)
[Average miles per tank]

H2=AVERAGE(H6..H38)
[Average days between visits]

J2=AVERAGE(J6..J38)
[Average cents per mile]

K2=AVERAGE(K5..K38)
[Average dollars spent per day]

L2=AVERAGE(L6..L38)
[Average dollars per gallon]

Formatting
To make the calculated values display appropriately, as dates or currency or decimal numbers, highlight the cells that are to display calculated results. For example, for the cells that hold the date values, highlight the column of cells starting at B4, then select the Format menu and choose Number. In the dialog box that appears, make your selections for Date values. Do the same for the values that are to display currency and decimals, selecting the appropriate options in the Numeric dialog box.

The fun stuff
This ClarisWorks solution makes use of some tricks pointed out in Figure 2. Of note are:

* The gutter to the left of the general display. To create this gutter, "begin" your spreadsheet and the related formulas at column B, not A. Then reduce the column width of A.

* "Floating" text block. Add a "floating" text block by selecting the "A" tool and drawing a text box.

* Gradient in Header. Add a Header to your spreadsheet, then draw a rectangle with a gradient fill, cut it and paste it as an in-line graphic in the Header text. Align text and gradient by setting text to Superscript style.

* Em dash. Use an em dash (Option-shift-dash) to help you format your data and to prevent the display of irrelevant information, such as premature "miles per gallon" information, which depends on previous values to calculate.

* Colored cell borders. Add emphasis to a cell, through a colored border by selecting the "Rectangle" tool and holding down the Option key as you draw a rectangle. (The rectangle must have a transparent fill pattern.)

The advanced stuff
The heart of the solution is daily tabulations, indicated by those cells that have been formatted to have no borders (starting at G5). Note the calculations are spelled out in Figure 2 above. After you fill out your spreadsheet with these formulas, you may notice that what they all have in common is a test for a value (in this case, a date) that is greater than one in either B5 or B6, which represent your first and second visits to the gas station. To get the formulas to apply to all the days you fill your tank, you'll want to follow these steps for each column, G, H, I, J, K, and L:

1. Highlight the column of cells starting at G5 through G38.

2. Go to the Calculate menu and choose Fill Down.

The value for G6 (the miles covered between visits) can now calculate for each visit to the gas station. Do the same for the columns starting at H5, I6, J6, K6, and L5.

Your spreadsheet is ready to hit the pavement! Print out an empty version and record your data at the gas pump each time you fill your tank.

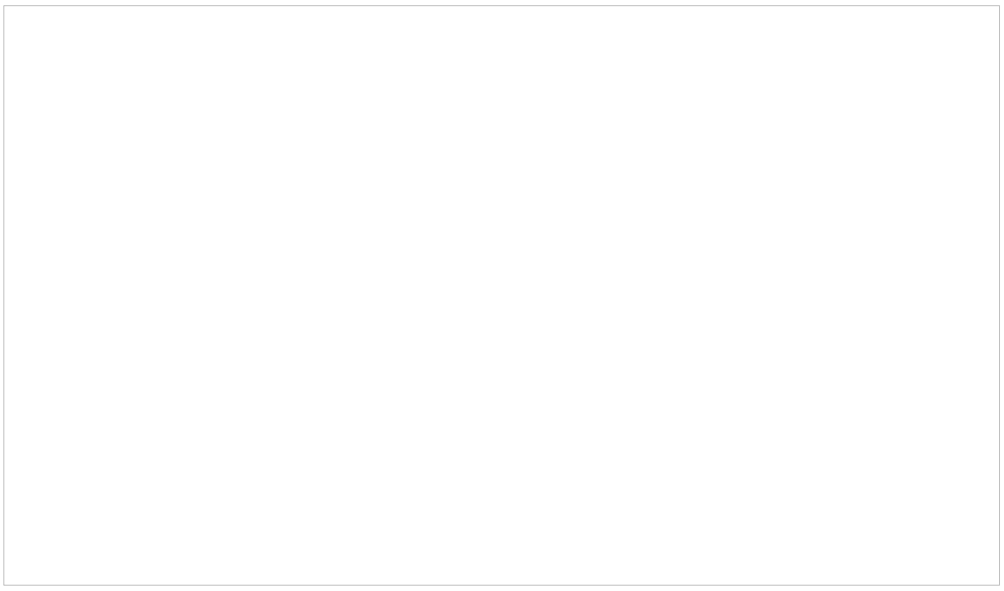

Figure 1. Track miles with a ClarisWorks spreadsheet. Collect data manually, then enter it into your spreadsheet to have ClarisWorks do all the math.

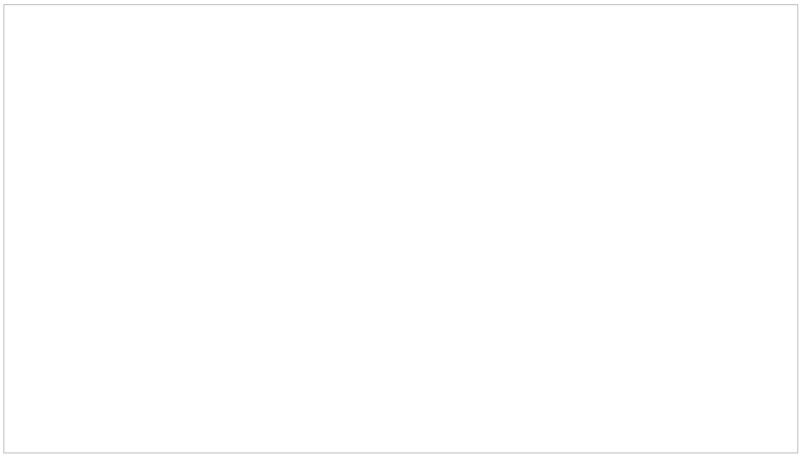

Figure 2. Behind the scenes of the ClarisWorks spreadsheet, these are the tricks that make it work.

DOS 3.3: Interrupts (IRQ)

Interrupting the Apple's 6502 microprocessor while using DOS can be treacherous.
This article has been archived and is no longer updated by Apple.
DOS uses location $45 when converting your decimal numeric parameters to hexadecimal for its internal use. Similarly, the monitor's interrupt handler uses $45 to save the 6502 accumulator. So, if an interrupt occurs while DOS is executing a command, the numeric parameters DOS uses when it executes commands are changed. Also vulnerable is the sector length of the files listed in a catalog, since DOS also uses $45 to display this length.

Since DOS uses timing loops during its read and write operation, interrupting the Read Write Track Sector routines can kill a disk. DOS protects itself from IRQ, but has no control over NMI (nonmaskable interupt)--so don't use a NMI while using DOS.

AppleShare PC: Checking Compatibility with the TELEX 386?

I want to install AppleShare PC on a TELEX 386, models 1285 and 7065. Will the LocalTalk PC Card work in these machines?

This article has been archived and is no longer updated by Apple.
We aren't familiar with the TELEX 386 (nor do we have documentation on it), and we don't know of anyone who has used AppleShare PC with it. However, you might check these articles in the Tech Info Library.

- "LocalTalk PC Card and PC-Compatibles: Compatibility Issues"

- "LocalTalk PC Cards and AppleShare PC: Compatible Systems"

- "AppleShare PC 2.0: Compatible Network Cards"

They discuss many of the compatibility issues of using the LocalTalk PC Card with IBM PC-clones. After reading the articles, it should become clear to someone familiar with the TELEX whether the two might be compatible and whether it is worth their time to test that configuration.

ClarisImpact: Chart Axis Precision Different from Numeric Precision in Table

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Issue:

The precision indicated in my Chart axis is not as precise as the numbers from my Table. I have typed in 4 columns of numbers. For example:

Label 1	Label 2	Label 3	Label 4
0.036	0.035	0.038	0.038
0.037	0.039	0.039	0.034

The chart I created from this table has a Y axis that looks like the picture below (Figure 1). Why are my numbers all 0.04?

Answer:

You need to format your cells so that the precision is greater. Select all the numbers in the Table and then choose Number Format from the Table or Chart menu. Change the Number Format to Fixed and the Precision to whatever you need (in this case, 3).

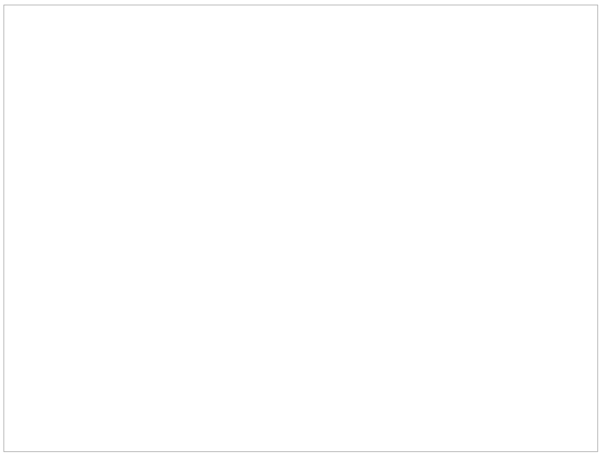

Figure 1

ClarisDraw 1.0: Hardware Requirements

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Required Equipment:

* Apple Macintosh, Plus, Centris, Classic, LC, SE, Performa, PowerBook, II, Quadra or Power Macintosh family computer
* Hard disk drive and minimum 2 MB memory
* 4MB memory for System 7 and System 7 Pro
* 8MB memory for Power Macintosh
* System software 6.0.7 or later, System 7 or System 7 Pro

A list of specific printers which have been certified or verified as fully functional with ClarisDraw is not available. In general, any printer that is compatible with Apple print drivers and/or the above referenced Systems should work with ClarisDraw 1.0.

Since Claris no longer licenses nor provides plotter drivers, there was no plotting testing done with ClarisDraw.

There was no compatibility testing done with QuickDraw GX printer drivers.

MacDraw Pro: PostScript Error with A la Carte EPSF Clip Art

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Files from the A la Carte clip art collection from 3G Graphics may result in a PostScript error when attempting to print. These files can be opened as MacDraw Pro documents, or placed into existing MacDraw Pro documents without problems, but cannot be printed.

Suggested workarounds:
1) After bringing the file into MacDraw Pro, save it out as an EPSF file. Bring that resulting EPSF back into MacDraw Pro and it will print without error.

2) Bring the clip art into ClarisDraw or ClarisImpact, if those are available to you. The files will print from from either of those applications.

Claris Development is aware of the problem.

ClarisWorks: Exporting Fixed Length Fields

Fixed field length formats are commonly needed to send to the post office for bulk mailings., and for importing into other mainframe databases. Here's how to get a fixed field length format exported from ClarisWorks.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Many types of databases require that each field have a certain number of characters in each field, usually referred to as a fixed length format. ClarisWorks databases use what is called a variable length format. To export ClarisWorks files in a fixed length format, follow the instructions below.

Explanation of Variable and Fixed Length Formats

In a variable length format database file, instead of counting the number of characters to determine where the next field begins, the program looks for a delimiting character. A tab, for example, is placed in between field values in a tab separated text file. If you have two fields, such as First Name and Last Name, here is what the program stores:

In a variable length format : Mary*Smith (where the * represents a tab)
In a fixed length format with 10 characters per field: Mary^^^^^^Smith^^^^^ (where the ^ represents a space).

Notice that there are six spaces after 'Mary' (4 characters 'M-a-r-y' plus six spaces equals ten) and five after 'Smith.' If you type in fewer characters than required by the field, the program adds spaces to make up the difference.

Most fixed length formats allow from 1 to 30 characters per field. Seldom do they allow for more characters than that. Since a variable length format does not care exactly how many characters there are in a field, the amount of text you can put in one is usually much higher. ClarisWorks , for example, allows you 510 characters in a text field .

ClarisWorks will only export variable length fields, but you can create a calculation that will translate your fields to a fixed length format. Then you export only the fixed length field. When that is imported into the database that follows a fixed length format, it will separate the information out into separate fields.

To Export Fixed Length Fields From Clarisworks:

ClarisWorks does not have a mechanism to export just one field, so you have to take a couple of extra steps:

1) Make a copy of the database. CAUTION: DO NOT FOLLOW THESE INSTRUCTIONS ON YOUR ONLY COPY OR YOU WILL LOSE THE INFORMATION IN IT.

2) Create the calculation field:
Assuming that you need the First Name and Last Name fields exported with 10 characters each, here is the calculation that you would use. It is only different from the FileMaker Pro calculation in that each field name has to have apostrophes around it.

ExportField (Calculation, text result) = Left('First Name' & "^^^^^^^^^^",10) & Left('Last Name' & "^^^^^^^^^^",10)

You will need the quotation marks. And, again, the caret (^) stands for a space.

For each additional field, add this to the end of the calculation:

& Left(Name of your field & "^^^^^^^^^^", Number of characters there are supposed to be in the field)
The number of carets (^) should equal the number of spaces needed in the field.

3) Change the type of the field from Calculation to Text.

4) Delete all of the rest of the fields from Define fields. If you have not made a copy of your database, or if you are not completely comfortable doing this, then do not attempt this. This will delete the information in your database except where it is listed in the fixed length format, and it is difficult to get it back into separate fields.

5) Go to the File menu and choose Save As and save the file as ASCII text.

ClarisWorks: Printing Graphic Objects without Borders on DeskWriter

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Graphic objects created with the Polygon, Regular Polygon, Freehand and Bezigon tools that have a transparent pen pattern do not print with a transparent border on the DeskWriter. The objects in the printout show an outline. The best work around is to change the pen color to white or the pen width to none. This will eliminate any color or line width so that your graphic objects print without borders.

ClarisDraw: Gradients Print With Little "X" Marks or Imperfections

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you copy an object filled with a gradient from ClarisDraw and paste into another program such as Microsoft Word or MacWrite Pro, then print with the LaserWriter 7.0 driver, your gradient will have little "X" marks on parts of the gradient (they may look like little imperfections).

Workarounds:
1. Use the LaserWriter 8.0 driver (preferably 8.1.1 or later).
2. Save from ClarisDraw to EPSF format and then import into your other program.

ClarisImpact: Presentation Text Not Centered

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The "Global" and "International" Master Slide Styles in ClarisImpact presentations are set to center the title and the body of each slide. The body, however, is set with a default left indent of .38 inches. The result is that the title and the body cannot easily be aligned.

To correct this, follow these steps:

--Global Style
1) Create a new Presentation with the Global style.
2) Switch to the Master Slide.
3) Select the Master Title block.
4) Change the font to Bodoni Bd BT.
5) In the Layout menu, turn Autogrid off.
6) Move the Master Title block to the right by pressing the right arrow on the keyboard 13 times.
7) Switch to Slide 1 and click Yes when asked to update the existing slides.

--International Style
1) Create a new Presentation with the International style.
2) Switch to the Master Slide.
3) Select the Master Title block.
4) In the Layout menu, turn Autogrid off.
5) Move the Master Title block to the right by pressing the right arrow on the keyboard 13 times.
6) Switch to Slide 1 and click Yes when asked to update the existing slides.

Special Characters for Languages Other Than English

If you have ever wondered where to get the special characters like the umlaut or the tilde, here is a handy little chart.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Many people use Claris products to work in foreign languages, even though they purchased their Macintosh with a U.S. keyboard and the English language version of their System software. In order to write in other than English, you need a number of special characters. Special characters are also used in editing and desktop publishing. These characters are not a function of any individual application on a Macintosh. They are, however, a part of many Macintosh fonts. Be aware that these characters are not likely to be in all fonts. They are part of most of the standard Macintosh fonts, however. To find other characters not listed here, use the Key Caps application, found under the Apple menu. By pressing various combinations of keys, Key Caps will show you all the characters contained in a particular font.

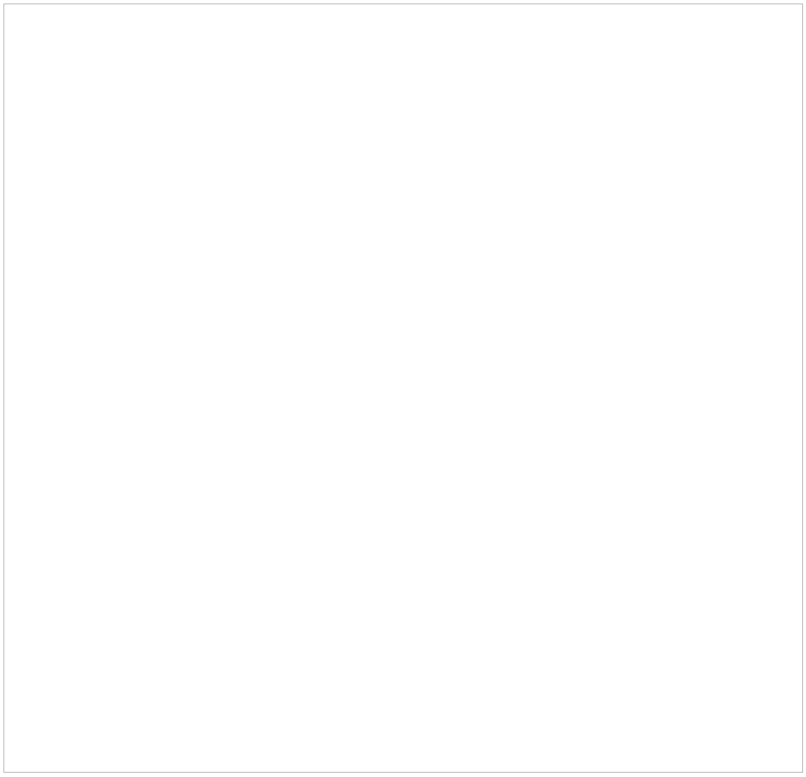

Figure 1: Commonly Used Foreign Language Characters and Symbols

ClarisDraw 1.0v1: Text Blocks Get Smaller When Converting From MacDraw Pro

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Caption Text blocks may shrink slightly when converting from MacDraw Pro to ClarisDraw 1.0v1. What this means is that the last word on a single line of text may wrap to create a second line. Try this example:

1. Open MacDraw Pro and choose the Text Tool.
2. Click your mouse once anywhere in the document.
3. Type, "Mary had a little lamb".
4. Select the Text block with the Arrow Tool and set font to Geneva.
5. Convert to ClarisDraw.

Workaround:
If you have not used layers in your MacDraw Pro document you can save to PICT format (Copy and Paste will not work nor will saving to MacDraw II format).

Caption vs. Paragraph Text Block:
A Caption Text Block is created when you click your mouse with the Text Tool. A Paragraph Text Block is created when you drag with the Text Tool. You can change a Caption into a Paragraph Text Block by selecting it with the Arrow Tool and resizing it.

This issue is resolved in ClarisDraw 1.0v2.

ClarisWorks: Actual vs.Set Communications Speeds (14.4k baud vs 9600 baud)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Q: I cannot seem to operate at 14.4k baud. I've tried setting the baud rate at 19.2 and use XON/XOFF but that does not work, either. I spend a lot of time on Internet and various BBS and the extra speed would save money. What can I do?

A: 14.4k baud is an effective speed which is obtained by a hardware compression protocol and is strictly dependent on the modem. The actual transmission speed (through the lines) is 9600 baud.

In order for 14.4k baud to be realized, both modems (Host and Guest) must support data compression (MNP or V.42bis for example), they must support the same protocol and must have been initialized by the initialization string (see modem manufacturer) that turns on and configures the modem for that mode of operation. Otherwise transmission will take place at 9600 baud or slower.

ClarisWorks: Gradebook Template in ClarisWorks for Teachers

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Chapter 3 of the ClarisWorks for Teachers book covers the usage of a template called Gradebook. The Gradebook template does not work whenever a student scores 100% in the Grade Percentage column (column D). Instead of "A+" showing as the grade "#N/A!" will be the answer.

Make a backup of your Gradebook file before starting the steps to fix your file listed below. Also, the steps below assume you have not modified the original template so make any changes to the directions as apply to your modified Gradebook file.

1. Go to the Format menu and choose Document. Change the number of columns from 40 to 41.
2. In cell AO4 enter "100" and in AO5 enter "A+".
3. In cell E7 change the cell references for AN4 to AO4 and AN5 to AO5 so that formula now reads, =LOOKUP(D7,AB4..AO4,AB5..AO5).
4. Select cell E7 through E30 and then choose Fill Down from the Calculate menu.

ClarisWorks and ClarisImpact: Gradient PICT Objects Overlap Object Boundaries

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There is a known issue when printing gradient PICT objects that have been subscribed to, converted, inserted, or placed. The issue occurs only when printing to a laser printer.

Shapes and Tools with gradients saved with PICT format will print with the gradient out of the boundaries.

To reproduce the issue:
1. On a new document draw any shape.
2. Fill it with gradient.
3. Save it as PICT format.
4. Open the saved file.
5. Print the file to a laser printer

Subscribed objects that contain gradients will also print the gradient out of the boundaries when printing to a laser printer.

1. Launch ClarisWorks or ClarisImpact and create a new draw document.
2. Select a shape tool, draw its object and fill it with a gradient.
3. Select the object and choose "Create Publisher..." from the Publishing sub menu under the Edit menu.
4. Name the file and click the Publish button.
5. Select "Subscribe To..." from the Publishing sub menu under the Edit menu.
6. Select the Edition file and click on the Subscribe button.

7. Print the document to a laser printer

Notice that the gradient extends beyond the boundaries of the object.

Published Date: Feb 18, 2012

ClarisDraw & MacDraw Pro: MacDraw II Files Get Larger When Imported

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When converting a MacDraw II document to ClarisDraw or MacDraw Pro the size on disk may increase dramatically. For instance, converting the MacDraw II sample document "Floor Plan #1" to ClarisDraw will increase the size on disk from 16k to 36k. On the other hand, a sample file from MacDraw Pro called "Dances of Spheres" will only increase from 36k to 40k when converted to ClarisDraw.

Explanation:
* MacDraw II only has the ability to work with 8 colors while ClarisDraw has the ability to work with 256 colors and MacDraw Pro millions of colors. The overhead for handling more colors can be significant.
* If your document has an imported picture then ClarisDraw may need to convert it to an editable Paint Frame. Again, the overhead for more capability will be represented in the file size.
* The file packing method for ClarisDraw and MacDraw Pro is different than MacDraw II. When designing the method for writing the information into a file there are tradeoffs between file size and speed. Specifically, the file size for ClarisDraw is larger but the access speed to the data in the file is faster.

* In general, MacDraw Pro and ClarisDraw are more sophisticated than MacDraw II and that is represented in the file size.

ClarisDraw 1.0v1: Issues Opening MacDraw Pro Slides

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When opening a MacDraw Pro slide document with ClarisDraw 1.0v1, you may encounter some anomalies. For example, a landscape oriented slide document may open with a portrait orientation in ClarisDraw.

To specifically illustrate this, a sample MacDraw Pro slide show with a Document Size (from the Layout Menu) setting of 11.97 Width and 8.89 Height, opened in ClarisDraw with a width of 8.89 and a height of 6.67.

Also note that the new Slide Manager features of ClarisDraw open a document to the Master Slide, instead of to the first slide, as in MacDraw Pro. Upon conversion to ClarisDraw, use the slide navigation control at the lower left of the window to switch from Master Slide to one of the slides in your document.

If, after doing so, your slide still seems oriented incorrectly, you may need to choose Document Size from the Layout menu and enter an appropriate width and height. If necessary, choose Show Graphic Ruler from the View menu to give you guidelines on how wide and tall the page size will need to be to display your slide.

This issue is resolved with ClarisDraw 1.0v2.

ClarisImpact: Service Bureaus for Professional Publishing

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you need to output your ClarisImpact documents professionally, there are flyers in the ClarisImpact box for two companies that offer expert output. Check the envelope that says "Get more power from your new Claris software!" for full details.

Kinko's are known to have ClarisImpact in their stores. You may call 1-800-743-COPY for the location of the Kinko's store nearest you. Be sure to check to see if they have 35mm slide output capability, if that's the service you need.

Autographix Presentation Partners definitely offer 35mm slide output. Their brochure in the ClarisImpact box contains a listing of all locations nationwide.

Unfortunately Claris does not have the resources to maintain a complete listing of service bureaus who support Claris products. This is by no means a complete list of service bureaus that can help you. We suggest you check your local telephone directory for service bureaus in your area.

ClarisWorks: Spreadsheet Borders Print Thicker after First Page on DeskWriter

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This issue is resolved with ClarisWorks 4.0v1
(tested with DeskWriter 550C and DeskWriter driver 6.0)

Normally, cell borders print as hairlines to a Hewlett-Packard DeskWriter. ClarisWorks 2.1v3, 2.1v4 and version 3.0 spreadsheets will print borders as hairlines on the first page of a print job, but all subsequent pages will print with very thick border lines.

Workarounds:
1. Revert to ClarisWorks 2.1v2 or earlier or upgrade to version 4
2. Print your pages one at a time. The thicker lines only occur on the second and subsequent pages of a print job.

This printing issue has been tested with the DeskWriter driver versions 3.9, 5.0 and 6.0.

PostScript: How to Set Precision Bitmap Alignment

If I create a rectangle in MacDraw and print two copies to a LaserWriter, one may measure 150mm x 200mm, and the other 151mm x 201mm. There is a variation in both dimensions. Sometimes, however, they may match perfectly. I am using the LaserWriter in a four-layer printing process and find this inconsistency very annoying.

Because the variation is in both dimensions and the age of the LaserWriter is relatively new, I believe the paper weight (which is within specification), the paper finish, and the age of the LaserWriter are unlikely to be possible causes of the problem. Can you help?

This article has been archived and is no longer updated by Apple.
The size variance described is a result of PostScript interpretation of the bitmapped image. This results from attempts to change a 72-dpi image into a 300-dpi image. This is not an exact ratio. There may be as much as a 4-percent variance in PostScript's interpretation. PostScript's attempts at correction may vary slightly during each pass.

To compensate for this difference, choose Page Setup from the File menu. On the right side of the Page Setup dialog box, there is an Options button. Click this button, and an additional dialog box appears. The fourth checkbox is labeled Precision Bitmap Alignment (4-percent reduction). Be sure this checkbox is marked. Using this option increases the printing time. However, the printouts will be consistent during each pass.

ClarisDraw: User Guide‘s Bind Text Example is Misleading

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Richmond University logo example on Page 7-20 of the ClarisDraw User's Guide demonstrates how to bind text to a circle. The example does not explain how to bind the text so that "Richmond" is written clockwise and "University" is written counter clockwise. Also, the figure on page 7-21 specifies inaccurate numbers for the starting point.

It is not possible to bind text to one object but have it go in two different directions. In order to achieve the results shown you will need to use two circles. Create the outside circle, duplicate it and then bind "Richmond" to one circle and "University" to the other circle. Finally, overlap the circles so they appear as one.

The starting points listed on page 7-21 are not accurate. Refer to the article titled, "How to Determine Where Text Binding Starts?" for details on starting points.

ClarisImpact: Organization Charts and Flow Charts Do Not Print or Print Blank Pages

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you create an organization chart or flow chart in ClarisImpact that is wider or taller than 113 inches, you will not be able to print it. It might print some blank pages, or all of the pages may be blank.

This is a QuickDraw limitation that affects the printable area of both organization charts and flow charts.

Claris Product Development is aware of the issue.

Here are some suggested workarounds:

1) The easiest workaround is to ungroup the organization or flow chart before printing.

IMPORTANT NOTE: Once you ungroup the organization or flow chart, it will lose its links and chart characteristics. Be sure to save a copy of the chart first and ungroup the copy. Keep the original file as a grouped model so that you can do edits and updates.

To ungroup the copy, when you're working in the organization chart (or flow chart), click once outside the boundary of the model. This will select the model itself, as a grouped object (note the four selection handles). Now, choose Ungroup from the Arrange menu. You should see an alert with a warning "Once ungrouped, you will not be able to edit the model using model tools and commands. Continue?" Click Ok if you wish to ungroup the model objects and lose their special characteristics, as mentioned above.

2) Assuming you are using a default organization chart style and direction, consider changing the direction from top-down to left-to-right. Changing the direction to right-to-left will take up less space.

3) In an organization chart, change the worker layouts of the levels that take up the most space to one of the two vertical options. The easiest way to do this for a large organization chart is through level settings.

ClarisWorks 1.0v3: Adobe Type Manager (ATM) 3.6 Incompatibilities in System 7.1

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Adobe Type Manager 3.6 used in System 7.1 is incompatible with ClarisWorks 1.0v3.

ClarisWorks cannot build the Claris Fonts file if ATM is on.

Work around:
1) Turn off ATM
2) Open ClarisWorks. A Claris Fonts file will be built.
3) Quit ClarisWorks.
4) Turn on ATM.
ClarisWorks can be used as usual.

ClarisWorks: Error in Mortgage Maker Template

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

In the Mortgage Maker (SS) template included with the ClarisWorks Home Pack, cell H19 is meant to be an entry cell for "Additional Principle Payment Per Year." This cell incorrectly contains a formula and is protected.

To fix this, click on cell H19, choose Unprotect Cells from the Options menu, then type in the desired number. If no additional payment is desired, enter a 0 (zero). Remember to choose Calculate Now to recalculate the spreadsheet.

ClarisWorks: About Version 2.1v2 Macintosh, Read Me

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Welcome to ClarisWorks 2.1!

Thank you for choosing ClarisWorks 2.1. We're excited about this new release of ClarisWorks and we hope you will enjoy using it. This document provides some late-breaking information that couldn't be included in the printed manual.

Please read this file carefully. It contains several important tips that may give you better results or make it easier for you to use ClarisWorks. You may even wish to print this document for use after you have installed ClarisWorks.

PERFORMANCE TIP
* Adjusting ClarisWorks Memory
As with any Macintosh program, you will gain greater flexibility and performance if you increase your application memory size. This is especially true if you work in the Paint environment, work with larger documents, or work with a number of documents during the same session. Similarly, if it takes a long time to print documents, increasing the memory size may help. For more information on increasing memory size, consult the ClarisWorks Installation and New Features Guide, under adjusting memory.

NEW FEATURES AND CHANGES IN VERSION 2.1

ClarisWorks version 2.1 has a number of powerful new features, and enhancements to several existing features. The Installation and New Features Guide describes the most important changes. Additional information is outlined below.

* Balloon help is now available for the buttons in the shortcuts palette. If you are unsure of which command a button performs, choose Show Balloons from the Help menu to display the name of the button.

* The Make Custom Style shortcut now appends style information to the font and size in the Style menu.

* If you import a PICT file into a paint frame or document, ClarisWorks now matches the imported file's resolution. It will also use the color table of the original picture.

* If you set the default fill pattern to be transparent, ClarisWorks now displays the Transparent icon in the pattern indicator of the tool panel.

* New file filters have been added to ClarisWorks 2.1. A ClarisWorks 1.0 text filter has been included to simplify translation of ClarisWorks 2.0 or 2.1 files to ClarisWorks 1.0. A new filter provides support for reading and writing Excel 4.0 files.

* ClarisWorks 2.0 and 2.1 files are identical. Version 2.0 can open version 2.1 files automatically and vice versa. ClarisWorks 1.0 files can be opened in version 2.1. You will be notified when ClarisWorks 1.0 files are opened in version 2.1 and, to ensure that your ClarisWorks 1.0 files are not saved over unintentionally, a suffix "[v2.1]" will be appended to the file name. If you want to replace your ClarisWorks 1.0 files with ClarisWorks 2.x versions, you may do so easily. Simply perform a Save or Save As, remove the "[v2.1]" when defining the file name, and click "Yes" when asked if you want to "Replace existing" file.
* Discretionary hyphens included in documents created in version 2.1 will appear as box characters when the file is opened using 2.0.

SOME TIME SAVING FEATURES
* "ABOUT Stationery"
This file contains information about using and creating Stationery files with ClarisWorks 2.1. Stationery files are templates that can save you time when you create a new document such as a memo or letter. To access the "ABOUT Stationery" file, select New... from the File menu, click on the pop-up list to the right of the Stationery label, select "ABOUT Stationery", and click OK.

* "ABOUT Sample Files"
This file describes the Sample Files that are included with ClarisWorks 2.1. Some of the sample files were specifically created to be used as is-just enter your own information. Other sample files demonstrate the wide range of possibilities ClarisWorks provides. "ABOUT Sample Files" is in the Sample Files folder within the ClarisWorks 2.1 folder.

* "More About Shortcuts"
Shortcuts are timesavers that give you pushbutton access to over 150 of the most frequently performed day to day tasks. You can personalize your Shortcuts palette to include those commands that you find useful. For a complete list of the Shortcuts and brief descriptions of what they do, open "More about Shortcuts." You will find it in the Sample Files folder within the ClarisWorks 2.1 folder.

PRINTING TIP
* LaserWriter IIg/IIf Owners

If you notice that horizontal or vertical lines in your documents are not being printed correctly, you will need to make a simple adjustment to your LaserWriter's settings. To do this you will need the LaserWriter tools disk that came with your printer. Just follow these three steps:

1. Open the LaserWriter Utility application on the LaserWriter disk.
2. Under the Utilities Menu, choose Set PhotoGrade.
3. Move the slider all the way to the left towards the "More Levels of Gray" option.

Your printer has now been reconfigured with the proper settings.

COMMUNICATIONS NOTES

* Claris Kermit Tool

ClarisWorks 2.0 includes a Kermit file transfer tool for Apple's Communications Toolbox. It is automatically installed into the Extensions folder under System 7 or into the Communications Folder under System 6. This tool behaves in much the same way as the XMODEM file transfer tool. If you use System 7, you can turn on Balloon Help under the Help menu to get additional information.

* VT320 Keys

This sample document contains Shortcuts that are the equivalent of function keys found on VT220 and VT320 terminals. When you open the document you will see information on using these Shortcuts.

POWER MACINTOSH OWNERS (PowerPC-based Macs)
* If you transfer files between a Macintosh and a Power Macintosh (PowerPC-based Mac), the results of some spreadsheet or database floating point calculations may differ slightly. To display values identically on both platforms, set a fixed number of decimals using the Number Format or Field Format commands.

* When sending files with a file transfer tool which supports batch mode, such as the Claris Kermit tool, use the Send File command rather than the Send Batch command to avoid a system crash. Apple is aware of this System problem and is working on a solution.

ClarisWorks: About Version 3.0v1 Macintosh, Read Me

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Welcome to ClarisWorks 3.0!

Thank you for choosing ClarisWorks 3.0. We're excited about this latest release of ClarisWorks and know that it will help you to be more productive and creative. This Read Me file documents some additional tips that may prove helpful when using ClarisWorks 3.0.

New Features with ClarisWorks 3.0

* Assistants

ClarisWorks now includes eight Assistants you can use in working with documents for your home, school, or office. Assistants ask you questions and then produce a document or part of a document based on your answers. Assistants also guide you on the content of your document.

Some Assistants create complete documents such as newsletters, presentations, name and address lists, envelopes, or calendars. To use an Assistant, choose New from the File menu and then click the Start With An Assistant Or Stationery button.

Several Assistants (for making a table, typing a footnote, addressing an envelope, or finding and opening a ClarisWorks document) are available when you are working within a document. To see what task Assistants are available to you in your current work environment, choose ClarisWorks Assistants from the Help menu that you can find by pulling down the Apple menu on the far left of the Menu bar.

* Cross-platform compatibility

ClarisWorks 3.0 for Macintosh has the same file format and features as ClarisWorks 3.0 for Windows. It also opens files created in ClarisWorks for Windows versions 1.0 and converts them to version 3.0. You can create a ClarisWorks document on Windows and edit it on a Macintosh computer or vice versa. Consequently, if you work with both Macintosh and Windows versions of ClarisWorks, or if you collaborate with colleagues who use ClarisWorks 3.0 for Windows, you can work without translating files or learning a different program.

Version 3.0 opens and saves files that are fully compatible with ClarisWorks versions 2.0 or 2.1, so you can use your existing 2.x files and/or share work with colleagues using version 2.x.

When you use ClarisWorks 3.0 to open ClarisWorks 1.0 files, ClarisWorks displays a message and adds [v3.0] to the file name. To replace your ClarisWorks 1.0 files with ClarisWorks 3.0 versions, choose Save or Save As from the File menu, remove [v3.0] from the file name, and click Yes when ClarisWorks asks if you want to replace the existing file. If you are converting a number of files from the 1.0 to 3.0 file format, you can access the Preferences dialog from the Edit menu and turn off the Old Version Alert and/or the [v3.0] Suffix.

Due to differences between Macintosh and Windows platforms, it is necessary to use a file transfer program such as PC Exchange, AccessPC, or a similar utility in order to transfer files via floppy disk. These utilities require that your Macintosh have a high density drive (FDHD SuperDrive). Follow the directions in the documentation of the file transfer utility program. After copying the files to or from a PC formatted disk, rename the files with DOS-compatible file names (8 characters or less) and include the .CWK extension.

After renaming your files, copy them to your computer's hard drive, if desired, and open them as you would any ClarisWorks document.

Fonts, margins, page breaks, and graphics may appear differently after being transferred from the Macintosh. You can minimize unintended consequences associated with font changes by using TrueType fonts on both platforms. Helvetica on the Macintosh converts well to Arial on Windows, and similarly Times converts well to Times New Roman. It may be necessary to change the margins and page breaks in order to restore the original page breaks. QuickTime movies will be converted to PICT images. In addition, some macros created on the Macintosh may not run as expected on Windows. In these cases, it is necessary to recreate your macros.

* Word count

To count the words in your document, choose Writing Tools from the Edit menu and then choose Word Count.

* MacWrite Pro file filter

A new MacWrite Pro file filter will allow translation of MacWrite Pro documents.

TECHNICAL TIPS

Editing Documents Created with the ClarisWorks Assistants

Some documents created using the ClarisWorks Assistants (or provided as Stationery files) contain objects that are locked or grouped to keep objects in position and prevent accidental edits. To move or edit the objects, unlock and/or ungroup them:

1. Select the object while in Draw mode. Click the Arrow tool first if necessary.
2. Choose Unlock (or Ungroup) from the Arrange menu. If an object is both locked and grouped, first unlock it and then ungroup it.

To edit the text in an object, click the Text tool and then click on the text you want to edit.

TA43108_ClarisWorks_About_Version_v_Macintosh_Read_Me.pdf

Adjusting ClarisWorks Memory

You may want to increase the amount of memory set aside for ClarisWorks if you work with Paint documents, documents longer than ten pages, or if you want to have several large documents open at the same time. Increasing the memory allocation may also reduce the time it takes to print some documents.

To increase the memory allocation for ClarisWorks:

1. If ClarisWorks is open, quit the application.
2. Open the folder that contains the ClarisWorks 3.0 application.
3. Click the ClarisWorks application icon once. (If you click the icon twice, you'll start ClarisWorks. If that happens, choose Quit from the File menu and try again.)
4. Choose Get Info from the File menu.
5. Double-click the Preferred Size box.

(If your ClarisWorks Info box does not have a Preferred Size box, double-click the Application Size or Current Size box instead.)

6. Type a larger number to increase the memory size. If your computer has less than 4 Mb of memory, try setting the memory to 1450; if your machine has 4 Mb, try 1900; and if it has 5 Mb, or more, you may want to set it to 3072 or higher. If you are using a Power Macintosh computer, we suggest adding 2048 (or more) to the current setting.
7. Close the ClarisWorks Info window.

Running the Introduction to ClarisWorks

If you attempt to run the "Introduction to ClarisWorks" file on a computer with a monitor set to Thousands or Millions of colors and you get the message, "Not enough memory to run MacroMind Player.", you have two choices. Reset your Monitors Control Panel to 256 colors, or increase the memory for the "Introduction to ClarisWorks" file using the instructions found above under "Adjusting ClarisWorks Memory".

Printing on a LaserWriter IIg/IIf

If the horizontal or vertical lines in your documents are not printing correctly, you can adjust your LaserWriter.

1. Open the LaserWriter Utility application on the LaserWriter disk tools disk that came with your printer.
2. Choose Set PhotoGrade from the Utilities Menu.
3. Move the slider all the way to the left towards the More Levels of Gray option.
4. Quit the LaserWriter Utility application.

Claris and the ClarisWorks team want to thank you for your purchase of ClarisWorks 3.0. Your support enables us to continue working to bring you better solutions for your future productivity needs.

ClarisWorks: Home Pack Template "Names and Addresses" Does not Slide Properly

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

The Home Pack Stationery template called "Names and Addresses" has a layout for Avery 5160 Labels. The fields on this layout have a vertical space between the fields so that sliding up does not work well. If a field is left blank, the fields below will appear not to slide up. The best workaround is to select each field and move it up so it is touching but not overlapping the field above. This can be best accomplished by using the arrow keys on the keyboard to move a selected field. Figure 1 shows what the layout currently looks like and Figure 2 shows what the fixed layout should look like.

ClarisWorks: Rotated PICT Prints Jagged

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Issue:
Importing or Inserting a PICT into the drawing environment and then rotating it will make it print jagged to a QuickDraw printer such as a DeskWriter or a StyleWriter.

Solution:
1. Ungroup the PICT, then immediately group it again and rotate. It will work fine now.

or

2. Use a PostScript printer.

ClarisWorks: About Version 3.0 Windows, Product Fact Sheet

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Product Description:
ClarisWorks 3.0 software is the all-in-one answer for business, home and education.

ClarisWorks 3.0 dramatically enhances the award-winning 1.0 version of this integrated product. It features built-in Assistants to help users get their work done easily and produce professional results. It also adds brand new capabilities such as outlining, presentations, painting and Shortcuts, and enhances each existing environment while retaining the superior integration, small size and excellent performance of the original.

And ClarisWorks 3.0 is the exclusive integrated product to offer true cross-platform compatibility between Windows and Macintosh versions. The result is an even better value than ClarisWorks 1.0 that will appeal to a broad customer base of small business/home office, home and education users.

Target Customers:
* Small and Home Business users will find that ClarisWorks 3.0 is the only general productivity tool they'll need for creating standout letters, memos, reports, presentations, proposals, sales flyers, address books, contact lists and newsletters.

* Home users will appreciate the excellent value ClarisWorks 3.0 offers them. At the same price as ClarisWorks 1.0, users get four completely new capabilities and more than 300 enhancements to improve their productivity.
* Mobile professionals will benefit from the program's small size and speedy performance. And with its exclusive cross-platform transparency and extensive file exchange capabilities, users can easily switch between Windows and Macintosh computers, and read and save files to most other popular software programs.
* K-12 Educators will find ClarisWorks 3.0 to be an even better teaching tool with new important capabilities such as presentations, outlining, and painting, yet retaining the simplicity, superior integration and small size of ClarisWorks 1.0.
* Higher Education students, faculty and administrators will use ClarisWorks 3.0 as a one-stop productivity tool. Its new outlining, full-strength word processor and extensive charting capabilities perfectly address the expanding needs of college users.

Key Enhancements:
New Capabilities
* Claris Assistance technology helps users achieve consistently professional results. Seven Assistants include newsletter, presentation, table, envelope, footnote, name and address database, and calendar. The Assistants offer expert advice on layout, design, and content. And the technology is extensible so users can simply drop in new Assistants as Claris and selected parties deliver them.
* Complete outlining feature allows users to organize their thoughts and documents using six popular outline styles including Harvard, legal, numeric and bulleted formats.
* Presentation Slide Show with Video for Windows support. Users can create dynamic slide show presentations complete with background and border colors, and Video for Windows movies. Presentations can be either manual or auto-advance.
* Shortcuts offer push-button access to the 150 most frequently used commands such as spell checking, cell formatting or auto-summing. Just as with the menus, the icon palette automatically configures itself to the environment being used (e.g. text or spreadsheet).

* Full-color paint capabilities and 32 gradient fills allow users to add even more striking graphic effects to documents.
* Exclusive cross-platform compatibility with ClarisWorks for Macintosh gives users identical users interfaces and file formats so information can be shared transparently across operating systems.

New Word Processing Features
* Automatic text wrap around graphics creates more professional-looking brochures, flyers, newsletters and more.
* Custom text styles allow users to create, name and save frequently-used text styles for instant access.
* Individually variable column widths. Users simply click on the column controls button to automatically add columns to their layouts; then visually adjust column size by dragging the column to the preferred width.
* Show and hide invisible characters allow users to view all format commands in their documents for accuracy.
* Document statistics such as word count; Expanded spell check selection.
* Original date and time clock permanently reflect the original date and time a document was created.

Expanded Charting and Spreadsheet Capabilities
* Hi-Low-Close charts are ideal for tracking pricing trends, such as stocks, with defined beginning and end points.
* Combination charts allow users to combine chart options -- like using a line chart with a bar chart -- to illustrate contrasting data more effectively.
* Pictogram charts translate plain numeric data into compelling charts that graphically depict data.
* Unparalleled chart format customization. Users can customize any or all of their charts -- change fonts, styles, adjust orientation, title and legend placement and size, select symbols, colors, scales, patterns, 3D and more.
* Spreadsheet cell wrap. When cell wrap is applied, text automatically wraps within the cell boundaries.
* Lock Title option locks column headings in place so they remain in constant view for quick reference as users scroll through documents. This

also reduces the need for screen splitting.

New Database Features
* Automatic field entry from pop up menu. Users can save time and avoid repetitive data entry by creating a pop up list of data. This also ensures data consistency and accuracy.

* Automatic serial numbering.
* Automatic date, time, creator, and modifier stamps.
* Automatic field validation (uniqueness, within range, emptiness).
* More than 50 predefined Avery label formats make it a snap to generate labels.

Graphics Enhancements
* Color paint environment includes 18 tools and six transformation effects.
* Gradient palette adds pizzazz to presentations with 16 black and white and 16 color gradients.
* Bezigon and Polygon drawing tools make it easier than ever before to create and style curves and shapes.
* Repeat Object Placement simplifies the placement of duplicate graphics by automatically placing duplicates of graphics in equidistant sequence from the original.
* 75 piece clip art library and 7 Monotype fonts including Arial, Bodoni, Gill Sans, Klang, New Berolina, Old English and Script make it easier than ever to create professional documents.

In-Package Support Materials:
* Introductory tour
* Comprehensive on-screen help
* Users Guide
* Quick Reference Guide
* Free America Online software access kit and registration to access online support.

* FaxWorks software bundled in the box at no extra charge.

Support Services for Registered Owners:
Customer Relations
* Maintains registered customer database.
* Handles non-technical questions, i.e., registration status, etc.
* (408) 727-8227
* Phone lines staffed from 8 a.m. - 5 p.m. PST, Monday through Thursday and 8 a.m. - 2 p.m. PST, Friday.
* (800) 544-8554 for product upgrade order forms and instructions.

Technical Support
* Handles technical questions, problems with operating the software.
* Standard Technical Support is currently available free for 90 days following a user's first call. (408) 727-9004.
* Pay-As-You-Go support is available through the 800 GuideLine (800-965-9090, credit card required) and the 900 GuideLine (900-230-3000).
* Phone lines staffed from 6 a.m. - 6 p.m. PST, Monday through Thursday and from 6 a.m. - 2 p.m. PST, Friday.
* Free 24-hour Voice AnswerLine, (800) 735-7393.
* Free 24-hour Fax AnswerLine, (800) 800-8954.
* Online support is available through CompuServe Forum (Go Claris), America Online Forum (Claris), and Claris Bulletin Board (408-987-7421).

* Subscription Services are also available.

System Requirements and Compatibility:
* PC with any 386DX with 25 Mhz or higher processor.
* Requires a floppy disk drive, hard disk and 4 MB RAM. (8 MB recommended)
* VGA or better video.
* Mouse.
* MS-DOS 5.0 or later; Microsoft Windows 3.1.
* Compatible with Windows 95.

Price and Availability:
* Available in October, 1994.
* $99 suggested retail in the U.S.
* Upgrade price direct from Claris in the U.S. is $49 and will include Borland Sidekick through January 31, 1995.

Special Characters that do not directly Map to Windows

Characters I type in ClarisWorks on the Macintosh do not always display correctly under ClarisWorks for Windows. What is happening?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The following High ASCII characters displayed in the table below show characters on the Macintosh that have no match in Windows (Figure 1). These characters do not map directly to any Windows font.

If these characters are included in a cross-platform file, they will not map correctly across to Windows. There are several work arounds for this.

* Have two layouts, one for the Windows machine, one for the Macintosh machine. On the Windows layout, create a field with the ASCII code for the character, format the field with the Symbol font, and lay it on top of the original field. (The ASCII codes for the Symbol font provided in Windows are also listed Figure 1.)

ClarisWorks: Paint Documents, Memory, and Margins

If you like to paint in ClarisWorks, keep memory allocation in mind.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

When you create a new painting document in ClarisWorks 2.0 and higher, the default margins are set to one inch, with a size of 468 pixels across and 648 pixels down, a resolution of 72 dpi (dots per inch), and typically a depth of 256 colors. Pixels are the equivalent of dots. Changing the margins does not automatically change the number of pixels down or across. Use the following formula to calculate the number of pixels for a different size document:

(Number of Inches) * (72 pixels per inch)

So, for a new, untitled, letter-sized painting document, 468 pixels across by 648 pixels down equates to 6.5 inches across by 9 inches down. Now, if you want a letter-sized document with a 1/2 inch margin all around, your printable area would be 7.5 inches across and 10 inches down. To fill that page with a painting, set the size to 540 pixels across and 720 pixels down by choosing Document from the Format menu.

(7.5 inches) * (72 pixels per inch) = 540 pixels across
(10 inches) * (72 pixels per inch) = 720 pixels across

If you see an error message like "The document size has been reduced to fit the available memory," "Out of Memory," or "Not Enough Memory to Perform Operation" while you are working in an application, it doesn't necessarily mean you don't have enough memory in your computer. When you launch a Macintosh application, it requests the amount of memory set in its Get Info window. To increase an application's memory allocation:

1. Quit the Application and return to the Finder.

2. Go to the actual application program icon (not a document created in the application or the folder that contains it) and click once to select it.

3. From the File menu, choose Get Info.

4. Increase the memory in the Application Memory Size box at the bottom of the Get Info window. If you are using System 7.0, increase the Current Size. If you are using System 7.1, increase the Preferred Size. The formula for the amount of memory needed is:
(Application Memory Needed)k = (Width * Height * Pixel per inch * Number of colors)/1024

A letter size page with a .5 inch margin and 256 colors:

1350k = ((7.5 inches) * (10 inches) * (72 pixels per inch) * 256 colors))/1024

If you find that you can get the Info window open, but cannot change the memory size, double-click on the application icon and choose Quit from the File menu.

Once you find a memory allocation that works, return to the finder and choose About this Macintosh from the Apple menu. Make sure there is still some available memory. Otherwise, the System won't be able to grab more memory when it needs it.

ClarisDraw: No Original MacDraw Translator

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisDraw will not import files from the original MacDraw. ClarisDraw does include a translator for MacDraw II, MacDraw Pro and PICT.

The best workaround is to use MacDraw to save your files to PICT format. Once the PICT files have been imported into ClarisDraw, you can use the Ungroup feature to separate the objects that make up the PICT.

ClarisDraw & ClarisImpact: Not QuickDraw GX Certified

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Issue:

Printing to a desktop printer icon using System 7.5 and the LaserWriter GX driver from ClarisDraw 1.0v1 or ClarisImpact 1.0v1/v2. If you print a document using a desktop printer icon while the application is open, the document will print to the default printer (the printer selected in the Chooser), rather than to the printer represented by the icon. If you print using the desktop printer icon while the application is not running, the document prints to the correct printer.

ClarisDraw and ClarisImpact are not certified compatible with the QuickDraw GX printer drivers.

ClarisImpact: Documentation Error - Table Cell Backgrounds

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The manual states on page 6-26 that it is possible to add a color, gradient or pattern to a cell. While it possible to add color, it is not possible to add a gradient or pattern to a cell.

To add a pattern or gradient you will need to make the table transparent and then draw a square filled with a gradient or pattern and position it beneath the cell or cells of the Table.

Claris Draw: Left Margins Clipped When Printing to a Personal LaserWriter NT or NTX

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Left margins can get clipped when printing to a Personal LaserWriter NT or NTX.

To reproduce:

1. Launch ClarisDraw.
2. Choose Rectangle tool, and draw a rectangle to cover the entire page.
3. Print to a LaserWriter NTX

You will see that the left margin of the rectangle is clipped.

The Claris graphics development team is a aware of this issue.

MacDraw Pro: Zoom Level Limitations

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The maximum zoom level in a MacDraw Pro document of one page is 3200%. However, because MacDraw Pro decreases the maximum zoom level based upon the number of pages in the drawing area, if you use the largest possible Drawing Size, the maximum Zoom level will be 400%. When you have reached the maximum zoom level, the zoom-in mountain icon will be dimmed. This is a limitation of MacDraw Pro.

The best solution is to upgrade to ClarisDraw, which does not determine the maximum Zoom level based on the size of the drawing area. In ClarisDraw, you can use any zoom level at any time.

TokenTalk: Troubleshooting Problems

I am having problems with system bombs under the following conditions:

The environment is a Token Ring network with DOS and OS/2 workstations and approximately 12 Macintoshes on the ring. I am using Excel with MacIrma and TokenTalk installed. When the system is not on the network, the Macintosh displays a system error. If the TokenTalk software is de-installed, the Macintosh works fine, and no system bombs occur.

Software

System 6.0.3
MultiFinder
MacIrma 1.2.0
Excel 2.2
TokenTalk 2.0 (6/29/89)

Have you heard of any situations similar to this?

This article has been archived and is no longer updated by Apple.
We contacted DCA Technical Support Group, and they have not heard of this problem. They also tried to duplicate the problem for us and could not get the system to fail.

The tests were done with both MacIrma 1.2.0 and 1.2.1, on both Macintosh IIcx and Macintosh IIx systems, and TokenTalk 2.0. Both machines passed the test with either version of MacIrma.

You might have a conflict between TokenTalk and something else other than MacIrma. You may want to start with a clean System Folder to see if the problem remains. If a clean folder solves the problem, start adding INITs and see which one conflicts with TokenTalk.

ClarisWorks: Charting High, Low and Closing Price of Stock (SS)

Using the Hi-Low chart option to plot the high, low, and closing price of stock

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

If you follow the stock market, you may have a need to chart the high, low, and closing price of a stock. In ClarisWorks 2.X and 3.X, there is a Chart Option called Hi-Low that will allow charting of data in this style. However, the data must be set up in pairs in order for the Hi-Low to display correctly. This can be a problem when the closing price of the stock is a single value. Fortunately, you can still use the Hi-Low chart option with a little creative spreadsheet management.

Assuming that you want to plot the high, low, and closing prices of companies A, B, C, D and E, you would create a spreadsheet similar to the following (see also Figure 1).

	ColumnA	ColumnB	ColumnC	ColumnD	ColumnE
Row1		hi/low		close	
Row2	StockA	53	16	33	33
Row3	StockB	72	13	63	63
Row4	StockC	52	8	24	24
Row5	StockD	85	22	76	76
Row6	StockE	54	39	46	46

The trick here is to repeat the closing price a second time to simulate a high-low pair.

Then, select the cell range A1..E6 and choose Make Chart from the Options menu. Since the closing prices are pairs of the same number, what you will end up having on your chart is a high-low vertical line for the high and low stock prices, and a single tick line or hash mark somewhere along this vertical line for the closing price (see Figure 2).

Figure 1: Sample Spreadsheet

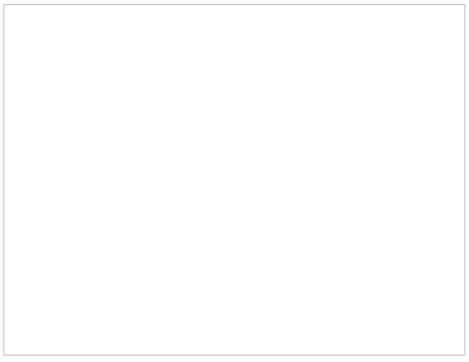

Figure 2: Sample Hi-Low Chart

Can‘t Save Empty Untitled Document

When I create a new ClarisWorks document I'm unable to save it right away. Why can't I create an article and start saving right away?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
You can not choose Save... from the File menu, or use command-S, in a new ClarisWorks, ClarisImpact or ClarisDraw document until you have added at least one text or graphic object to the document, or in some other way modified the document. This is true even if you have chosen Save As..., given the file a name, closed the file and opened it again. While it may be disconcerting to hit command-S and have no response, there is little reason to choose Save... for an empty, unmodified document.

ClarisWorks: "Wrap text in cell" Option in Table Assistant Doesn‘t Work

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When creating a table using the ClarisWorks Assistant technology, there is an assistant called Make Table which helps you create tables.

While creating a table, the selection that allows you to wrap text within the cells of the table does not work for the first row (the title row) in the resulting table.

There is no workaround at this time.
Published Date: Feb 18, 2012

ClarisWorks: Translating AppleWorks Files (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This requires a Macintosh with a SuperDrive, Apple's PC Exchange Control Panel, and Apple's ProDOS Extension (With System 7.5 or later the ProDOS Extension is not needed). The Claris translators and the XTND System files must be in the Claris folder in the System Folder. Once the software is properly installed, restart your machine. Then, whenever you insert an Apple II disk, the disk icon will have a "II" (Roman numeral 2) on it.

Translating these files to ClarisWorks at this point is the same as translating files from other applications. If everything is properly installed, you can then drag and drop the AppleWorks document icons on the icon for ClarisWorks. Another way would be to open up ClarisWorks and choose Open under the File menu. If you already have a file open, you can also choose Insert from the File menu.

Published Date: Feb 18, 2012

ClarisDraw: Bitmapped Graphics from MacDraw Pro or MacDraw II Lose Precision When Converted

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Some MacDraw II or MacDraw Pro documents with high-resolution bitmapped objects in them (such as 300 DPI scans) may not retain this high bitmap resolution when the file is converted to ClarisDraw format. The bitmapped image may convert at 72 DPI. This happens with only a small minority of these files. Currently, it is not known how to determine the low probability that a file will be affected.

If this occurs, the best workaround is to first save the drawing as PICT from MacDraw II or MacDraw Pro, then open that PICT file in ClarisDraw. The high resolution of the bitmapped image will be retained.

Published Date: Feb 18, 2012

ClarisWorks: Can‘t Build Custom Color Palette Automatically

Can I automatically build a custom palette in ClarisWorks based on the colors in my current document?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

No, ClarisWorks cannot build a custom 256-color palette based on the colors in a document.

ClarisWorks does allow you to choose between the Claris 81-color palette and a variety of 256-color palettes included with ClarisWorks. You can also create your own palette manually by dragging the palette windoid out into the page and double clicking colors you want to change in the palette windoid, and then going into Preferences and saving the palette.

Published Date: Feb 18, 2012

ClarisWorks 2.1: Cannot Create a New Database

I get a coprocessor not installed error when creating a new ClarisWorks database. I have a Color StyleWriter 2400 and was able to do this before I got the printer.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
When you have the Color StyleWriter 2400 (driver 1.6) selected in the Chooser, ClarisWorks versions 2.1v1, 2.1v2 and 2.1v3 will not allow you to create a new database. If you attempt to create a new database, your computer will freeze or display a "coprocessor not installed" or other system error.

The solution is to update to ClarisWorks version 2.1v4 or later. The best solution is to upgrade to ClarisWorks 4.0, 5.0, or AppleWorks 5.x.x.

The StyleWriter 2400 was not on the list of hardware that was tested and certified to be compatible with ClarisWorks version 2.1v3 and earlier. This is because this printer (and the version 1.6 driver) were not on the market and available for testing at the time Claris shipped version 2.1v3 of ClarisWorks.

You can update to version 2.1v4 or upgrade to a higher version. Check the Apple Software Updates for the earlier updates. Check with your reseller for obtaining a newer version of ClarisWorks.

Note to Power Macintosh Owners
ClarisWorks 2.1v4 is not available in a "native" (accelerated) version. So, the 2.1v4 Updater will not update the native PowerMacintosh version of ClarisWorks 2.1v3. The best option in this situation is to upgrade to version 4.0 or 5.0, which includes a Power Macintosh version of ClarisWorks that is compatible with the Color StyleWriter 2400.

Alternatively, you can install the regular (non-accelerated) Macintosh version of ClarisWorks 2.1v3 onto your Power Macintosh, then update that with the 2.1v4 Updater. To do this, first run the ClarisWorks installer. Click the Customize button for a custom install, select "ClarisWorks for Macintosh," then click Install.

Work around
In lieu of updating, the following work around will enable you to use the ClarisWorks database, regardless of the Macintosh type:

Select a different printer in the Chooser, create a new database (or open an existing), and then reselect the Color StyleWriter. However, you will have to repeat this work around every time you wish to create a new database or open an existing one.

ClarisDraw 1.0v1: Objects Do Not Snap Properly to a Fine Grid

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

In ClarisDraw 1.0v1, specifying a very fine grid and high zoom percentage may result in objects not properly snapping to the grid when dragged with the mouse. (The objects will probably snap properly when moved with the cursor keys.) You will see this especially if you have the Object Info palette open and are watching the object's position as you move it.

ClarisDraw 1.0v2 considerably improves object placement on the grid.

Published Date: Feb 18, 2012

DOS 3.3: "Not Direct Command" Error

A "Not direct command" error is caused by invoking certain DOS commands from a machine language routine.
This article has been archived and is no longer updated by Apple.
When DOS receives commands, it checks to ensure the current BASIC interpreter is running in order to allow you to respond to an input statement with "Running", instead of trying to run the "Ning" file. The commands which cause these errors are listed on page 122 of the DOS manual.

The following relocatable machine language routine insures that DOS is satisfied.

```

A/UX: Scheme Implementation

Article Change History

08/31/92 - REVIEWED
* For technical accuracy.

Do you know of any versions of scheme that might run under A/UX 2.0?

This article has been archived and is no longer updated by Apple.
There is a very good Scheme from MIT called C-Scheme. Look in goofy:~malcolm/bin/src/scheme.tar for the bits. There is probably a more recent version, and one of the README documents should tell you where to find it.

Also, Yale T has been ported to A/UX; it's available by anonymous FTP from ai.mit.edu, among other places.

ClarisWorks 1.0v3: Disk Contents (Macintosh) and Installation Guide

An itemized list of the disk files for ClarisWorks 1.0v3 for the Macintosh and where they will be installed on your hard drive

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

```
The ClarisWorks 1.0v3 Disk Set for the Macintosh (a total of 6 disks) contains the following items.  File
sizes of individual items are approximate.

Installer (disk)
    Claris Translators (folder)
         Acta 3.0 (8K)
         AppleWorks (28K)
         AppleWorks GS (6K)
         EPSF PFLT (4K)
         MacPaint 2.0 (4K)
         MacWrite 5.0 (16K)
         MacWrite II (20K)
         Microsoft Word 3.0 (32K)
         Microsoft Word 4.0 (36K)
         Microsoft Word PC (20K)
         Microsoft Works 1.1 (14K)
         Microsoft Works 2.0 (16K)
         PICT (2K)
         RTF (26K)
         Text (6K)
         TIFF (26K)
         WordPerfect (38K)
         WordPerfect PC 4.2 (20K)
         WordPerfect PC 5.0 (20K)
         WriteNow (32K)
         WriteNow NeXT (22K)
    Claris XTND System (38K)
    ClarisWorks Translators (100K)
    Installer (130K)
    Installer Script (40K)

References (disk)
    Dictionaries (folder)
         Main Dictionary (166K)
         US Thesaurus (152K)
         User Dictionary (2K)

    Sample Documents (folder)
         Book of the Month (22K)
         Flyer & Order Form (34K)
         Quarterly Earnings (10K)
         Sales Commission Letter (10K)
         Sales Report (26K)

Communication (disk)
    Communication Tools (folder)
         Apple Modem Tool (88K)
         Serial Tool (32K)
         Text Tool (26K)
         TTY Tool (64K)

ClarisWorks 3.0 Disk Contents (Macintosh) and Installation Guide

An itemized list of the disk files for ClarisWorks 3.0 for the Macintosh and where they will be installed on your hard drive

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The ClarisWorks 3.0 High Density Disk Set for the Macintosh (a total of 4 disks) contains the following items. File sizes of individual items are approximate. These are compressed files and will be uncompressed during the installation process.

Disk 1
Install ClarisWorks (1368K)
Read Me (12K)

Disk 2
Install ClarisWorks.2 (1378K)

Disk 3
Install ClarisWorks.3 (1378K)

Disk 4
Install ClarisWorks.4 (1114K)

You will need approximately 12 Mb of free space on your hard drive to do an Easy Install. When doing an Easy Install, the contents of the disk set will be installed onto the hard disk as follows:

At the root (main) level of your hard drive:
ClarisWorks 3.0 folder (folder)
ClarisWorks 3.0 (840K)

How To Connect Two Flow Chart Symbols In Separate Flow Charts To Each Other

Just how do you connect two separate flow charts?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
It is possible to drag a Connector from one Flow Chart Symbol to another but only within the same Model. It is not possible to drag a Connector from a Symbol in one Flow Chart Model to a Symbol in another, separate Flow Chart Model.

A work around would be to combine the two Flow Chart Models.

1. Click into one of the Flow Chart Models so that the gray border appears around the edge and then click on any Symbol in the Flow Chart so that it has selection handles on each corner of that Symbol (make sure your cursor is not blinking in the name field).

2. Choose Select All so that all the Symbols in the Flow Chart Model are highlighted.

3. Choose Copy from the Edit menu.

4. Click into the second Flow Chart so that the gray border is showing (again, make sure your cursor is not blinking in the name field).

5. Choose Paste from the Edit menu. The first Flow Chart may paste over the second Flow Chart so you will want to drag it down or to the right (the gray border will automatically enlarge).

6. Finally, draw a Connector line between the last Symbol of the first Flow Chart and the first Symbol of the Second Flow Chart.

Polygons, Bezigons, Freehand Objects do Not Print To Hewlett-Packard Deskwriter from MicroSoft Word

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This issue is fixed in ClarisDraw 1.0v2.

In ClarisDraw 1.0v1 and ClarisImpact through 1.0v4, polygons, bezigons and freehand objects will not print to a Hewlett-Packard DeskWriter printer if you copy the objects via the clipboard and paste them into MacWrite Pro, Microsoft Word, and a number of other applications. These objects also will not print if you save the document as a PICT file and import it into the applications.

The objects will print to a DeskWriter if you save the document from ClarisDraw or ClarisImpact as an EPSF file and then place it in the other application, but the quality of the objects will be poor. This is only a solution for those interested in seeing a rough idea of what their documents will look like.

Popup Tools not Available on 68000 Machines

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
With ClarisDraw 1.0v1, "popup tools" (freehand, rounded rectangle, etc.) are not available on 68000-based machines (the Macintosh Plus, SE, Classic, Portable and PowerBook 100). The tools are actually available but you can't see them "pop out", so they appear to be nonfunctional.

This has been fixed in ClarisDraw 1.0v2.
Published Date: Feb 18, 2012

Regular Text Changed to White Text when Copying and Pasting

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This is fixed in ClarisDraw 1.0v2.

Text that is copied along with white text to the clipboard and transferred to the system's clipboard (by going to the Finder or another Application) will be changed to white text in the original ClarisDraw document.

To see the issue:
1) Create some white text.
2) Create some text that is not white.
3) Copy both blocks of text.
4) Switch to the Finder.
5) Return to ClarisDraw.

You will not be able to change the color of the text, or make any new text that is not white.

Opening QuickTake Images or JPEG /JFIF Compressed PICT Files

What to do if you get an error like: "QuickTime and a Photo - JPEG decompressor are needed to see this picture." when inserting

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
When attempting to open or insert a PICT file, the following text appears inside the inserted frame: "QuickTime and a Photo - JPEG decompressor are needed to see this picture." This can occur in any application that supports graphics handling, including ClarisDraw, ClarisImpact, and ClarisWorks.

Images saved from the QuickTake camera and its software are, by default, compressed PICT files. There are two ways to open, insert, or place these files.

Method 1
Install QuickTime software and a JPEG decompressor extension into your system folder, then reboot the computer. You will then be able to open or insert QuickTake files. (QuickTime version 1.6 or later works and is included with System 7.1 and later; QuickTime version 1.0 does not; QuickTime version 1.5 was not tested.)

QuickTime is an option installed with System 7 software. It is a file installed in the Extensions folder inside the System Folder. If it is not there, run the Installer program on your System 7 disks. In the installation window, click the Customize button. Then scroll down, click on QuickTime, then click Install.

A JPEG decompressor called "JPEGView JFIF Preview" is included with JPEGview. JPEGview is a shareware program available from the usual shareware sources (America Online, CompuServe, user groups, etc.). Drag this file into the Extensions folder, then reboot the computer.

Method 2
Open the QuickTake images in the QuickTake software. Save as PICT (no compression) or a TIFF file. Either of these file types can be opened in ClarisDraw, ClarisImpact or ClarisWorks without QuickTime and a JPEG decompressor.

Please note, though, that the uncompressed PICT may be 10-20 times larger than the JPEG compressed PICT. This is normal.

Assistants are Not Listed in Help Menu

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When you create a new document, all of the ClarisWorks Assistants are available to you. You can also access the Assistants by selecting ClarisWorks Assistants from the Help menu.

There are times when certain Assistants may not be accessible. For example, when in Browse mode in a database file, you cannot use the Insert Footnote assistant, so it does not show up on the menu.

On a Macintosh, if you do not have a document open, the only Assistant that will be listed is Find ClarisWorks Documents. On Windows, you will get an alert which says "No Assistants available in this type of document."

A/UX: "lint" Problem With Toolbox (9/94)

I am having problems using lint with toolbox programs. If I call lint to check programs that "include" header files from /usr/include/mac (for example, files.h), lint gives this message:

files.h(61):
**** cannot recover from this error ****

You can reproduce the error by going to /usr/lib/mac/examples/term and giving the command:

$lint -I/usr/include/mac *.c

The problem is not the include file "files.h". If you take it out, the same error happens with other includes. Can you explain?

This article has been archived and is no longer updated by Apple.
We have verified that the "**** cannot recover from this error ****" error message generated by "lint" (the C program checker) with toolbox "term" programs happen only on C programs that include the /usr/include/mac/files.h file or the "term.h" header file in the /usr/lib/mac/examples/term directory. The "lint" source reported a fatal error on the compiler and stopped the C code checking.

In later versions of A/UX, the source to "term" is no longer included in the product. Also, the "examples" directory is now in /mac/src.

Importing DIF as Text Creates Extra Records

Be sure to specify the DIF filter when importing into FileMaker Pro, especially if the DIF file was created by ClarisWorks.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Importing a DIF file exported from ClarisWorks into FileMaker Pro without specifying the DIF import filter will create extra records when importing.

The solution is to select the DIF filter in the Import dialog in FileMaker Pro.

The issue does not occur with DIF files created in FileMaker Pro.

Installing ClarisWorks 3.0 on a 68000 Mac with System 7.5

Some issues when installing ClarisWorks 3.0 on an older model Macintosh running System 7.5
This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When attempting to install ClarisWorks 3.0v1 on a 68000 Macintosh, such as an SE or Classic (NOT the Color Classic), which is running System 7.5, you will not be able to use the Installer. Double-clicking on the Installer icon will present the erroneous message: "The software requires a 68000 coprocessor which this computer does not have". Make sure that you are double clicking on the application icon and not the Introduction to ClarisWorks 3.0 self running demo icon.

The error occurs using either the ClarisWorks 3.0v1 HD (High Density) disk set or the 800K disk set. Custom install is not an option, because you cannot get to the Installer.

This error does not occur under versions of the System prior to 7.5.

Suggested workaround:
1) Consider using System software prior to 7.5
OR
2) Install the ClarisWorks on another Macintosh, then copy the files to the 68000 computer. Pages 6 and 7 of the ClarisWorks Installation Guide give a detailed description of the files installed and their locations.
If the Macs are networked, you can copy the files to the 68000 Macintosh via the network. If not, you will need to use a compression utility (such as DiskDoubler or Stuffit) to fit the installed files onto floppies before copying them to the destination Macintosh.

Claris Development is aware of the issue, but at this time we do not know when a fix will be forthcoming.

Trial Installers Try To Install on Installation Disk, Not Internal Hard Disk

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The ClarisImpact and ClarisDraw trial installers default to install on the installation disk and will return an error when you hit the install button.

To install them, simply click the 'Switch Disk' button until you see the name of the disk you wish to install the trials on.

ClarisWorks 3.0v1 Clip Art May Not Print Properly to a DeskWriter (DR)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
It has been reported that some of the Clip Art which ships with ClarisWorks 3.0v1 may not print properly to a DeskWriter. For example, the Champagne clipart will print partially, but not the stems of the glasses or the color fill.

Suggested workaround:
Select the graphic and choose Ungroup (or Ungroup Picture) from the Arrange menu.

Please note that an inline graphic in a Word Processing document cannot be ungrouped. To paste a graphic on the Drawing Layer of a Word Processing document (so that it does not flow with the text, but does allow you use the Text Wrap feature and allows you to ungroup it), click on the Arrow tool in the toolbar before Copying and Pasting or Inserting the graphic.

Even after ungrouping before printing, there are still 7 clip art images that print out incorrectly:
Alder B&W, Book1 (open) B&W, Christmas Tree, Fragile B&W, Horse B&W, Palm Tree, and Shapeburst 2 B&W.

The ClarisWorks 3.0v1 clip art will not print correctly to a DeskWriter when placed into either ClarisDraw or ClarisImpact. To print ClarisWorks 3.0 clip art from these products, use the same workaround of ungrouping the graphic before printing.

These reports, which have been reproduced here are reproducible to the DeskWriter 550C and the 560C, tried with drivers 5.0 and 6.0, and also tried with ClarisWorks 2.1v3 and 3.0. Saving as PICT and allocating more memory to ClarisWorks will not affect the printing.

Published Date: Feb 18, 2012

Rotated Images Don‘t Preview or Print on DeskWriter using Driver 5.0 or 6.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

There appears to be an incompatibility after rotating an image in MacDraw Pro, then printing to a Deskwriter using the 5.0 or 6.0 driver. To recreate, place a scanned image into a MacDraw Pro file. This was tested using a PICT file of a photograph. Choose Print and click Preview. The preview will show the image properly.

Now rotate the photograph 90 degrees and preview. The preview will appear to be blank. The report source was able to rotate the image in Adobe Photoshop, save as a PICT file and place in MacDraw Pro and print without difficulties.

This issue does not occur with ClarisDraw 1.0v2.

About Version 3.0 Windows, Read Me

This file ships with ClarisWorks and provides important information on some new features and on issues to be aware of when using ClarisWorks.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Welcome to ClarisWorks 3.0 !

Thank you for choosing ClarisWorks 3.0. We're excited about this latest release of ClarisWorks and know that it will help you to be more productive and creative. This Read Me file documents some tips that may prove helpful when using ClarisWorks 3.0, as well as some late-breaking information. You can print this document for future reference.

Assistants

ClarisWorks now includes seven Assistants you can use in working with documents for your home, school, or office. Assistants ask you questions and then produce a document or part of a document based on your answers. Assistants also guide you on the content of your document.

Some Assistants create complete documents such as newsletters, presentations, name and address lists, envelopes, or calendars. To use an Assistant, choose New from the File menu and then click the Start With An Assistant Or Stationery button.

Some Assistants (for making a table, typing a footnote, or addressing an envelope) are available only when you are working within a specific type of document (e.g. word processing or drawing). To see what task Assistants are available to you in your current document, choose ClarisWorks Assistants from the Help menu.

Editing Documents Created with the ClarisWorks Assistants

Some documents created using the ClarisWorks Assistants (or provided as Stationery files) contain objects that are locked or grouped to keep objects in position and prevent accidental edits. To move or edit the objects, unlock and/or ungroup them:

1. Select the object while in Draw mode. Click the Arrow tool first if necessary.

2. Choose Unlock (or Ungroup) from the Arrange menu. If an object is both locked and grouped, first unlock it and then ungroup it.

To edit the text in an object, click the Text tool and then click on the text you want to edit.

Cross-platform compatibility

ClarisWorks 3.0 for Windows has the same file format and features as ClarisWorks 3.0 for Macintosh. If you work with both Windows and Macintosh versions of ClarisWorks, or if you collaborate with colleagues who use ClarisWorks 3.0 for Macintosh, you can work without translating files or learning a different program.

ClarisWorks 3.0 for Windows opens and saves files that are fully compatible with ClarisWorks for Macintosh versions 3.0, 2.1, or 2.0, so you can use existing Macintosh 2.x files and/or share work with colleagues using version 2.x. Consequently, you can create a ClarisWorks document on Windows and edit it on a Macintosh computer or vice versa.

Due to differences between Windows and Macintosh platforms, it is necessary to use a file transfer program such as PC Exchange, AccessPC, or a similar utility in order to transfer via floppy disk. These utilities require that your Macintosh have a high density drive (FDHD SuperDrive). Follow the directions in the documentation of the file transfer utility program. After copying the files to a PC formatted disk, rename the files with DOS-compatible file names (8 characters or less) and include the .CWK extension.

After renaming your files, copy them to your PC's hard drive, if desired, and open them as you would any ClarisWorks for WindowsÊdocument.

Fonts, margins, page breaks, and graphics may appear differently after being transferred from the Macintosh. You can minimize font substitution problems by using TrueType fonts on both platforms. It may be necessary to change the margins and page breaks in order to restore the original page breaks. QuickTime movies will be converted to PICT images. In addition, some macros created on the Macintosh may not run as expected on Windows. In these cases, it is necessary to recreate your macros.

Opening ClarisWorks 1.0 files

When you use ClarisWorks 3.0 to open ClarisWorks 1.0 files, ClarisWorks displays a message and adds [v3.0] to the file name. To replace your ClarisWorks 1.0 files with ClarisWorks 3.0 versions, choose Save or Save As from the File menu, click OK, then click Yes when ClarisWorks asks if you want to replace the existing file. If you do not want to save over the ClarisWorks 1.0 file, rename the file.

Importing EPSF Images

When you import or insert an EPSF (Encapsulated Postscript File) image into a ClarisWorks document, it is converted to a bitmap.

Changing your Communications Document Default

If you frequently use another communications package other then Microsoft Windows Terminal, ClarisWorks can launch the program automatically. Choose Preferences from the Edit menu and click General (on the left) to display preferences for this category. Click the Change To... button under TERMINAL.EXE and select your communications software program (an .exe file).

General Troubleshooting
The following suggestions are offered as potential solutions to the stated condition. You may want to try any or all of them.

Installing
If the installer fails, make sure that the Virtual memory is turned on and set to the Windows suggested size (see Performance below). In addition, use Custom Install to install only the files that you need. If you are not using any other Claris products, remove any existing files in the Claris directory and any CLARIS.INI file (both usually in the Windows Directory) that exists from a previous version.

Some virus checking software may interfere with the installer and prevent a complete installation. If this occurs, turn off any virus checking software before starting the installer. Turn it back on after installation is successful.

Out of Memory Error Messages
If you encounter an error message which says there is no enough memory to perform an operation, try the following:
- adjust your Virtual Memory (see Performance below)
- check the DOS CONFIG.SYS and remove any unnecessary drivers and TSRs to free up more memory in DOS
- closing other applications and ClarisWorks documents that may be running in the background

Note: On computers with 4Mb of memory you may encounter out of memory messages when using gradients, creating paint documents, or using 256 color settings.

Performance
32-bit applications such as ClarisWorks require Virtual Memory to be turned on. In order to increase the performance on computers with 8Mb of memory or less, we recommend the following:
- Setting the Virtual Memory to Permanent
- Using the suggested size for your virtual-memory setting (usually twice the size of physical memory)
- Enabling 32-bit disk access

To make these changes to your system:
1. In the Program Manager, open the Main Group, double click on Control Panel, then double-click the 386 Enhanced icon.

2. Click the Virtual Memory button, then click the Change button.

3. Select Permanent from the Type pop-up menu.

4. Click the check box next to "Use 32-Bit Disk Access"

5. Accept the above settings and the suggested size by clicking OK.

If your suggested size is less than twice your physical memory, you may need to increase your free disk space by removing unwanted files or defragmenting the hard disk (DOS 6.0 users can use DEFRAG.EXE; DOS 5.0 users may use some other utility). Defragmenting your hard drive may also increase the performance of your computer.

We also recommend that you run SMARTDRV.EXE by adding the following line to your AUTOEXEC.BAT file: C:\\DOS\\SMARTDRV.EXE. Use the SMARTDRV.EXE version 5.0 that ships with DOS 6.0 for better performance.

Opening non-ClarisWorks files
If you are unable to open or insert files created by programs for which we provide a file translator, ensure that the file filters (files with the .x32 extension) are installed. Use Custom Install to install the filters.

Printing
If you have trouble printing, try installing an updated printer driver (may be obtained from your printer manufacturer or Microsoft Corporation). For instructions on installing a driver and configuring your printer, see the Chapter on "Control Panel" in the Microsoft Windows User's Guide.

If text is getting clipped on the right margin or if graphic objects print with thin lines across them (specifically on inkjet printers such as the Canon BubbleJet BJ600C), turn off Banded Printing. To do this, choose Preferences from the Edit menu, click General, and then click Banded Printing.

If you are using a Hewlett-Packard 560c deskjet printer, we recommend using version 4.2 of the printer driver, available from Hewlett Packard or Microsoft Corporation.

Printing Patterns
ClarisWorks supplies a palette of patterns that you can apply to graphic objects. Because these patterns are 72 dots per inch, high resolution

printers do not print patterns as they appear on the screen. You might want to select patterns that are less dense than others.

Video Cards and Drivers
If you have problems with your screen displaying objects correctly, you may have a problem with your video driver. If this is the case, try changing the resolution to 640x480 or 800x600. Or, try changing the number of colors displayed (for example, 256, 16K, millions of colors). To verify that it is a video driver problem, change the video driver to Windows standard VGA and run ClarisWorks. If the problem goes away, contact the video card manufacturer for the latest version of the driver or use the driver that is included with the Windows Installation disks.

To change your video driver settings, either follow the directions for your video driver setup or use Windows Setup as follows:

1. Go to the Program Manager and open the Main Group

2. Double click on Windows Setup and make a note of the current Windows Display setting

3. Choose Change System Settings from the Options menu

4. Click in the Display box and select the appropriate setting from the scrolling list and use the current driver if prompted

If you have don't have an accelerated video card and are experiencing slow screen redraws, we recommend that you turn Offscreen Drawing on. To do this: choose Preferences from the Edit menu, click General and click Offscreen Drawing (the checkbox is checked). However, if, after making this change, the screen does not redraw properly when you move objects, turn the Offscreen Drawing option off.

Custom Color Palettes
When using certain video drivers, you may encounter display problems with documents using Custom Color Palettes. We recommend using the default Windows color palette. If you have a document that uses custom colors, turn Offscreen Drawing on (see above). We also recommend closing all the floating color and gradient palettes as well as any ClarisWorks documents running in the background.

Fonts
If your fonts do not display or scale correctly (for example clipping or overlapping), try the following:

- Make certain a valid printer driver is selected as the default and that is it NOT the Generic/Text Only driver
- Enable TrueType (see Adobe Type Manager below)
- Make certain the standard Windows fonts, such as Arial, are installed properly

To select or change the default printer:
1. Go to the Program Manager and open the Main Group

2. Double click on Control Panel, then double-click the Printers icon

3. Select a printer from the Installed Printers list and click Set As Default Printer button

4. If you do not have any printers installer, refer to your Microsoft Windows User's Guide for instructions on installing printers

To delete or reinstall standard Windows fonts consult your Microsoft Windows User's Guide.

Adobe Type Manager
If you have Adobe Type Manager installed on your computer, make sure that "Banded Printing" is checked in Preferences (see Printing above). Also ensure that TrueType fonts are enabled on your system. To do this:

1. Go to the Program Manager and open the Main Group
2. Double click on Control Panel, then double-click the Fonts icon
3. Click the TrueType button, then click Enable TrueType Fonts

Claris and the ClarisWorks team want to thank you for your purchase of ClarisWorks 3.0. Your support enables us to continue working to bring you better solutions for your future productivity needs.

ClarisWorks 3.0 and Hewlett-Packard DeskJet Printer Driver Compatibility Information

To use ClarisWorks 3.0 with a Hewlett-Packard DeskJet printer, you will have to use a version of the printer driver that is above or below 5.0. Here's how to get one.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
ClarisWorks 3.0v1 for Windows is not compatible with the 5.0 version of Hewlett-Packard's DeskJet printer driver. If you have this driver set as your default printer driver in the Printer Control Panel, the Print dialog box will not appear on the screen when you choose Print from the File menu and you will be completely unable to print.

There are several workarounds for this particular issue. Claris has developed a new version of ClarisWorks 3.0v2 that does get around the 5.0 drivers. It is best though to update your current printer driver with Hewlett-Packard's new driver available on the Hewlett-Packard BBS. The file name is "DJ100EN.EXE", it is in the library 1A. The same driver can be ordered via U.S. mail on 2 diskettes for $7.95 and requesting part number DJ100EN.

The modem service is provided to Hewlett-Packard's customers to allow improved access to drivers and utilities for Hewlett-Packard personal computer and peripheral products. This is a download service only. Interactive messaging and technical support are not available through this service.

Some common printer driver file names as of 5/95 are:

L4WIN3.EXE --- LJ4 Family Driver 31.v1.50 for Windows 3.1. This driver supports the entire LaserJet 4 family of printers including the 4V/4MV. This is the 31.v1.35 driver with added support for the LaserJet 4V and 4MV printers. Similar drivers are also available in German, Spanish, and French versions. Last updated on 7/94

L4W31PS.EXE --- Postscript v2.1.1 Driver for Windows 3.1. This driver supports the entire LaserJet 4 family including the Color LaserJet and LaserJet 4V/4MV. This driver replaces all previous versions of the v2.1.1 LaserJet 4 Postscript driver for Windows 3.1. Similar drivers are also available in German, Spanish, and French versions. Last updated on 9/94

DJ100EN.EXE --- DeskJet 500 Series v6.1 for Windows 3.1. This driver supports the 500, 510, 520, 540, 500C, 550C, and 560C printers in Microsoft Windows 3.1. The DeskJet and DeskJet Plus ARE NOT supported by this driver. If you have one of the two above mentioned printers you should use the 4.1 version of the driver. Similar drivers are also available in German, Spanish, and French versions. Last updated on 5/95

D5WN31.EXE --- DeskJet 500 Series v4.1 driver for Windows 3.1. This driver supports the DeskJet, DeskJet PLUS, 500, 510, 520, 500C, 550C, and 560C printers in Microsoft Windows 3.1. Last updated on 5/94 (version probably frozen due to release of 5.x driver, but can be used if a Windows application is not compatible with the 5.x driver if you have a DeskJet or DeskJet Plus.)

All these drivers are self extracting archives and contain README files with installation information.

Claris Ships ClarisWorks Small Business Solutions Pack

NO LONGER AVAILABLE
41 ClarisWorks templates guide small businesses in managing everyday business tasks

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

MACWORLD EXPO, San Francisco -- January 4, 1995 -- Claris Corporation today announced that the ClarisWorks Small Business Solutions Pack is now available directly from Claris. The ClarisWorks Small Business Solutions Pack is a collection of 41 professionally designed, easy-to-use templates created to help small businesses streamline everyday tasks using ClarisWorks.

Available for both Windows and Macintosh computers, the ClarisWorks Small Business Solutions Pack features everything small business users need to manage and promote their business, including finances and office administration. It lets both new and experienced personal computer users benefit from the capabilities of ClarisWorks integrated or "works" software.

"The ClarisWorks Small Business Solutions Pack is part of the Claris strategy to offer solutions for key market segments in addition to its award-winning line of productivity software," said Maria Patitucci, small business solutions manager for Claris Corporation. "ClarisWorks Small Business Solutions Pack is an ideal product for millions of small business owners in the U.S., helping them become more productive and allowing them to better focus on their business."

The ClarisWorks Small Business Solutions Pack focuses on tasks such as creating a business plan, managing finances, generating job applications, timesheets, office supply forms, stationary, business cards, invoices, advertisements, and more. This complete collection of specialized templates is designed to produce professional results and work seamlessly with ClarisWorks.

ClarisWorks 3.0: The best all-in-one integrated software

ClarisWorks, the award-winning all-in-one software available for Windows and Macintosh, seamlessly integrates word processing, spreadsheet, charting, database, and graphics capabilities. Version 3.0, introduced in October, takes the lead as the best all-in-one software on Windows and Macintosh with feature enhancements that make it the ideal productivity solution for small business, home or education users.

Pricing and availability

The ClarisWorks Small Business Solutions Pack is available directly from Claris for $29 and works with ClarisWorks 2.0 and higher on versions of ClarisWorks for Macintosh, and ClarisWorks 3.0 and higher on versions of ClarisWorks for Windows. For general information about Claris products and non-technical questions, users should call Claris customer relations at (408) 727-8227 OR (800) 3CLARIS.

Claris Corporation, a leading worldwide vendor of Windows and Macintosh applications for business, education and home, is a subsidiary of Apple Computer, Inc., with headquarters in Santa Clara, Calif.

"Out of Disk Space" Error When Installing ClarisWorks 3.0 For Windows

What the "Out of Disk Space" error message may really mean if you get it while installing ClarisWorks 3.0.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

During installation of ClarisWorks for Windows 3.0, it is possible to receive the following error message: "Unable to copy Claris Installer to temporary location due to lack of disk space."

This error is not related to available hard drive space. It can be generated in any of the following situations:

1. You are running some form of anti-virus software that is resident in memory. VSAFE, which ships with the latest version of DOS, is one of the many anti-virus utilities that could conflict with the ClarisWorks install program. Claris recommends that you temporarily disable all anti-virus software before installing any Claris application. To check and disable anti-virus software, do the following:

a.) Check your CONFIG.SYS and AUTOEXEC.BAT files for programs that look like they could be anti-virus software. Some common ones are VSAFE, BOOTSAFE, and NAV. If you find any lines resembling these in the CONFIG.SYS file, you can prevent them from loading by typing REM^ at the beginning of the line on which they appear. [For clarity, a caret (^) is used in this example to represent a space.] When your system is rebooted, lines with REM^ in front of them are ignored and not loaded by your system. If you use MSDOS 6.0, you can hold down the F8 function key to step through the CONFIG.SYS file line by line and selectively load what you want. If you use MSDOS 6.2, you can hold down the F8 function key to step through the CONFIG.SYS and AUTOEXEC.BAT files line by line and selectively load what you want.

b.) Check to see if any anti-virus software is loaded at the Windows level. The two most common places in which anti-virus software could be loaded are the STARTUP group and the WIN.INI file. If you find an anti-virus software icon in your Windows STARTUP group, temporarily remove it from the STARTUP group and place it in another Program Group. The next time you start up Windows, the anti-virus software will not be loaded.

c.) To check your WIN.INI, open this file (located in the Windows directory on your hard disk) up in any text editor and look to see if you have any virus software listed on either the RUN= line or the LOAD= line. If you find a reference to anti-virus software on either line, the entire line can be temporarily disabled by placing a semicolon (;) in front of it. The next time you start up Windows, it will ignore any line that begins with a semicolon.

Once ClarisWorks is installed correctly, all anti-virus software can be re-enabled simply by removing the semi colon added in the steps above, since the conflict does not occur during normal operation.

2. Another situation where you may get the "Out of Disk Space" error when installing ClarisWorks 3.0 is when the memory configuration isnÕt optimized correctly. This can occur if device drivers and other memory resident programs are loaded into lower memory areas. This can be easily checked and corrected by running MEMMAKER (if you use MSDOS 6.0), OPTIMIZE (for QEMM users) or the equivalent for the memory manager being used. This will load many device drivers into upper memory and free up more conventional memory.

3. This error can also occur if the installer has issues creating / copying the temporary directory used during the installation process to your hard drive. To check this, get to the point where the error dialog box is displayed, then ALT+TAB to the Windows File Manager and see if the C:\\~MSSTFQF.T directory exists at this point. If it doesn't exist, there is some fundamental issue in creating the directory on that drive. If it doesn't exist, you can manually create it and rerun the install program.

4 . USE THIS AS A LAST RESORT -- Make a directory called CW30 off the root directory of your hard drive and within the CW30 directory create directories for each floppy in the installation set (i.e. DISK1, DISK2, DISK3, etc.). Copy in DOS (using XCOPY with the /S parameter is recommended) the relative floppy contents into each directory. Switch to the DISK2 directory and type: "APPSETUP C:\\CW30", but don't include the quotes. This should initialize the installer without copying files to the C:\\~MSSTFQF.T directory.

Self-running DEMO Works Properly only on 13" or Larger Monitors, or on a PowerBook with At Least 640X480 Pixels

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In addition to the regular ClarisWorks 3.0 application, there are also a trial version and a self-running DEMO. The trial version is a regular version of the application without the ability to save documents. The DEMO is an animated tour describing and illustrating the main features of the program.

The self-running demo of ClarisWorks 3.0 was designed to work on monitors 13" or larger. It will also run on those PowerBook computers with monitors which are at least 640 x 480 pixels. When run on displays smaller than this, the DEMO window appears at the bottom of the screen. There is no way to correct this issue.

The trial version of ClarisWorks 3.0 will run properly on any Macintosh.

"Cannot Write to Hyphenation Dictionary" Error

Something to be aware of if you use international dictionaries with MacWrite Pro 1.5v3 or ClarisWorks 3.0 on a Power Macintosh

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Issue: When attempting to use a non-U.S. dictionary in ClarisWorks 3.0 or MacWrite Pro 1.X, the following error message comes up:

"Cannot write to hyphenation dictionary, file is an unknown version or is damaged."

In fact, the issue is not related to hyphenation files.

This issue is specific to the Power Macintosh computers (PPC) and applies to English applications (U.S. and U.K.) using non-English dictionaries.

Solution: Trash the Claris Spelling Enabler (The Claris Spelling Enabler provides faster spell checking for English dictionaries on Power Macintosh computers. It's a Power Mac native version of the spell checking engine normally found in the individual dictionaries.) To remove the Claris Spelling Enabler, open the Claris folder within your System Folder and drag the file named "Claris Spelling Enabler" to the Trash.

The following has been included with the shipping materials of the International Dictionaries:

Note to Power Macintosh users:

When used with US and British versions of ClarisWorks 3.0v1, the enclosed dictionary is not compatible with the Claris Spelling Enabler. (The Claris Spelling Enabler provides faster spellchecking for English dictionaries.) To use this dictionary with ClarisWorks 3.0v1 you must first remove the Claris Spelling Enabler from your Claris folder.

To remove the Claris Spelling Enabler, open the Claris folder within your System Folder and drag the file named "Claris Spelling Enabler" to the Trash.

Assistant Shortcut Icons are Garbled

Several customers have reported that their Assistant shortcut icons appear garbled in the shortcut palette and in the Edit Shortcuts dialog.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Several customers have reported that their Assistant Shortcut icons appear garbled in the shortcut palette and in the Edit Shortcuts dialog. The Assistant Shortcut icons are stored in each Assistant file in the Claris folder as a resource. The other shortcut icons are stored as resources in the ClarisWorks application file. None of these icons is editable within ClarisWorks.

If the Assistant Shortcut icons are garbled, the solution is to replace them by running the ClarisWorks Installer, clicking Customize and installing only the Assistants. One of your System Extensions may have conflicted with the ClarisWorks installer, causing the corruption when you first installed. Be sure to disable Extensions when you reinstall by restarting your Macintosh with the Shift key held down until you see the message "Welcome to Macintosh. Extensions Off."

Another reason for the corruption may be disk compression software. If the issue persists even after reinstalling, disable disk compression software or specify that the Claris folder not be compressed.

Box Characters Printing That Don‘t Show on Screen

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Box characters print that don't appear on screen. This can happen if you type the forward delete key on the extended keyboard, which is below the Help key. MacDraw II does not support the forward delete key. If you type the forward delete key, instead of deleting the key in front of the cursor, MacDraw II adds the ASCII character for the forward delete key to the text block. This character does not add any space and does not show up on screen. To delete these characters, click in the word to the right of the characters. Press the left arrow (cursor) key so that the cursor is just to the left of the word. Then press the regular delete key until the characters are gone.

A Visual Guide to Installing ClarisWorks 3.0 for Macintosh

If you have never installed your ClarisWorks 3.0 software before, here is a step-by-step guideline.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

PART ONE: PREPARING TO INSTALL

1. Are you familiar with using your mouse to click, double-click, and drag things around on your screen?
If you need more information about using your mouse, working with disks, or making copies of documents and disks, see the documentation that came with your Macintosh (The User's Guide for the Performa is shown in Figure 1). If you are familiar with these procedures, continue.

2. What kind of machine do you have?
ClarisWorks will run on a Macintosh Plus or later model Macintosh. This includes the Macintosh Performas, PowerBooks, and all Power Macintosh computers.

Is your machine on the following list?
Macintosh Plus
Macintosh SE
Macintosh II
Macintosh IIx
Macintosh SE/30
Macintosh IIcx

Some versions of the above machines cannot use High Density (1.4 Megabyte) disks. (See Figure 2.) You may need to get ClarisWorks on 800k disks. Call 1-800-3-CLARIS to get these disks.

3. Do you have a hard disk with enough free space?
ClarisWorks needs an internal or external hard disk in order to run properly.

A complete installation of ClarisWorks 3.0 requires about 11 megabytes of free space. This includes the application, Assistants, the Introduction to ClarisWorks, on screen help, stationery files, clip art, spell-checking, thesaurus, hyphenation, import and export translators, and communications tools. If you don't have enough space, you'll need to remove some files from your hard disk in order to create enough space.

4. Are you upgrading from a previous version of ClarisWorks?
If you are upgrading from a previous version of ClarisWorks, skip to Part Two.

5. Are you on a network?
Contact your network administrator to see if you have the proper hardware and System software.

6. Which System software version do you have?
A. Go to the first item listed under your Apple menu. It should say, "About this Macintosh" or "About the Finder." (See Figure 3.)

B. Choose that item. You'll then see a window which says "System Software" followed by a number. (See Figure 4.) This number is the version of the System software your Macintosh is using. ClarisWorks needs System 6.05 or greater.

C. If you have System 7.0 or 7.0.1, we recommend that you install System 7 tune-up, version 1.1.1. System 7 tune-up is available from Apple Computer, Inc. If you see "7.0¥" or "7.0.1¥" the Tune-up has already been installed.

D. If you have System software that is earlier than 6.0.5, you'll need to install a more recent version. System software is available from Apple Computer, Inc. or many authorized Apple dealers.

7. How much memory (RAM) do you have installed?
Go back to the first item listed under your Apple menu, as shown in the graphic above. Look at the number next to, " Largest Unused Block." This is the amount of memory available above and beyond what the System requires.

If you have a version of System 6 (6.0.5 through 6.0.8), you'll need at least 1 megabyte of total memory (1 megabyte is equal to 1,024 bytes.). If the largest unused block says that you have less than 800k of memory available, you can increase the amount available to ClarisWorks by turning off MultiFinder. Go to the Special menu and choose Set Startup. If MultiFinder is selected, click Finder only and restart your computer before installing ClarisWorks.

If you have any version of System 7, you'll need at least 2 megabytes (2,048 bytes) of total memory and at least 800k in the largest unused block of memory.

If you have less than the recommended memory, you'll need to have more installed or your System software reconfigured. Contact your local authorized Apple service dealer to add memory to your machine. If you're not sure how to reconfigure your System folder (removing excess fonts, etc., check with your service dealer, as well.

8. Register your software.
Please take time to complete and mail the postage paid product registration card, or call (800) 325-2747 to register by phone. For information about customer support, refer to the Claris Support Portfolio Service Directory included in the product package.

9. Make back up copies of your disks.
Lock your ClarisWorks disks by sliding the locking tab on each disk so that the hole is open. Then make copies of these disks before installation. Make sure that you name the disk copies with the same names as the originals. The Installer won't recognize the disks if they have different names. After making the backup copies, store the originals in a safe place. Lock the copies and use them for installation.

10. Turn off virus protection.
If you have virus protection software on your Macintosh, turn it off before installing. You can turn it back on after you're done installing. Check your virus protection software's documentation for instructions.

PART TWO: INSTALLING CLARISWORKS

Easy (complete) installation is recommended. This will install the entire ClarisWorks package.

1. Insert Disk 1 into the floppy (3.5 inch) disk drive on your computer.
The icon for the disk will appear on your screen. (See Figure 5.) Double-click on the disk icon to see the contents of the disk.

2. In the window for Disk 1, double click on the "Install ClarisWorks" icon. (See Figure 6.)

3. In a few seconds, you'll see the ClarisWorks Installer welcome screen. (See Figure 7.) Click on the OK button.

4. You'll then see the Install ClarisWorks window. (See Figure 8.)
This window has buttons on it which allow you to do a number of things. It will default to Easy Install, and the hard disk which has your System folder on it. This means that it will do a complete installation on your main hard disk unless you tell it to do something else.

If these settings are not what you want, you can click the Easy Install button and do a custom installation, installing only what you want. If you want the Installer to install ClarisWorks on another hard drive, click the Switch Disk button. If you want the Installer to install ClarisWorks in a particular folder, click on the pop-up menu.

When the settings are ok, click on the Install button. The Installer will tell you what it's doing and will ask you for each disk it needs.

5. After all the files are installed, the Installer will tell you that the Installation was successful.

6. Click on Restart. The ClarisWorks application is now on your hard disk in the ClarisWorks 3.0 Folder.

7. Double click on the icon for ClarisWorks 3.0 (it's in the ClarisWorks 3.0 folder).
When you launch it the first time, you should enter your name, the name of your company and your serial number from your registration card.

8. You can now safely remove the old version of the application, ClarisWorks 1 or 2.
Drag the icon for the old application into the Trash and empty it. Now, whenever you double click on a file, ClarisWorks 3.0 will open it. If you get a message which says that you don't have enough access privileges to throw away the old version, you have Applications folder protection on. Go to Control Panels under the Apple menu. If you're on a Performa, you may have to turn off this option in the Performa control panel. On other Macs, it's turned off in the General Controls control panel. (See Figure 9.)

9. If you are using the Launcher, there's one more additional step.
Open up the ClarisWorks 3.0 folder and click once on the icon for the application ClarisWorks 3.0 to highlight it (If you click twice, ClarisWorks will launch). Go under the File menu and choose Make Alias. You'll then see a file named ClarisWorks 3.0 alias. Place this alias file in your Launcher items folder in your System folder. If there's an alias file for an earlier version of ClarisWorks in the Launcher Items folder, trash it. Now, ClarisWorks 3.0 will appear in the Launcher. (See Figure 10.)

Macintosh: No Interface to IBM WheelWriter

I am looking for a Macintosh interface for IBM WheelWriter V, VI, or X? Is one available?

This article has been archived and is no longer updated by Apple.

We are not aware of an interface or driver for the Macintosh that supports any of the IBM WheelWriter typewriter/printers.

Published Date: Feb 18, 2012

Introduction Will Not Launch on Black and White Macintosh

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Introduction to ClarisWorks may not launch on a black and white Macintosh if you first install it on a color Macintosh and then drag copy it to the black and white Macintosh. The ClarisWorks Installer is intelligent and determines what kind of Macintosh you are installing onto so as to install the version of the Introduction that matches your screen.

The error message you will get is, "Wrong color resolution: Syncronicity: Desktop Folder: Claris_Cwks Preview: Cwks Intro_Final: Cwks".

The solution is to use your original ClarisWorks diskettes to install the correct version of the Introduction to ClarisWorks.

Black and White Macintosh computers include the Macintosh Plus and Macintosh SE.

Take a Look at ClarisWorks 3.0 Assistants

Are you new to computers? Are you interested in getting your work done in a snap? If so, the changes and enhancements in the ClarisWorks 3.0 integrated software package may be for you!

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
In focusing on providing easier access to the already powerful features of ClarisWorks, Claris has concentrated on making complex tasks easier to accomplish in the latest version of the software package. Claris has made all of the concepts and tools of ClarisWorks easier to learn and master.

The most significant advancement is the addition of "Assistants." The new Assistants feature guides you through the creation of certain types of complex documents as well as the performance of certain tasks by asking you questions that walk you through the process. Assistants allow you to concentrate on what you want to accomplish without having to master all the tools necessary to generate your desired results. In some cases, an Assistant can also supply "hints and tips" which give expert advice on how best to get your ideas across.

Within a ClarisWorks document, there are Assistants to help you create a table, insert a footnote, or address an envelope (known as "task Assistants"). They are accessed through the Help menu on Windows, and the Question Mark Icon (called "Guide Menu" under System 7.5) on Macintosh computers.

There are eight Assistants for the Macintosh and seven for
Windows:

- Name & Address List
- Calendar
- Newsletter
- Presentation
- Address Envelope, document creator and task assistant
- Insert Footnote
- Make Table
- Find ClarisWorks Documents, Macintosh only

As you can see, the idea behind the Assistants is to help you be more productive by allowing you to concentrate on what you want to do without having to invest a lot of time and energy in learning features and tools. Gone are the days of having to wrestle with document structure and design considerations.

The software architecture behind the Assistants, called Claris Assistance Technology, is extensible. As additional Assistants become available through Claris, and (over time) through selected third parties, they can be easily added to the Assistants library by you: therefore, to take advantage of new Assistants, you do not need to purchase new versions of ClarisWorks, as there is no need to modify the application itself to accommodate new Assistants.

Assistants at work
Let us look at an example. In business, organizations, and education, people often need to keep their customers informed of new developments, stay in touch with their membership, or provide a forum for the exchange of ideas and information. To do this, people frequently spend a great deal of time in the drafting and design of newsletters. ClarisWorks provides a Newsletter Assistant to guide you through the creation of just such a document.

Assistants of this type are accessed through the New Document dialog by clicking on the "Start with an Assistant or Stationery" button.

Once you select the Assistant you want, the interview process begins. The Newsletter Assistant starts by asking you what your goal is. Are you trying to provide instruction, or do you need to present a variety of news and general
information?

The Assistant responds intelligently to the answers you give and provides "tip text" which explains the different options, showing you how selecting a particular option impacts the design of the document. In our newsletter example, you can create either an instructional newsletter or a general information newsletter. The distinction here is that the instructional newsletter allows for long, in-depth articles placed sequentially from one page to another; while the design of the general information newsletter allows you to cover a variety of topics in a concise fashion.

Having received your answers to its questions, the Newsletter Assistant proceeds to ask what paper size and format style to use, offering choices ranging from "business" to "post modern." Each Assistant screen has a thumbnail (a small, icon-sized image) of the document created which changes in appearance, providing visual feedback to reflect the options you have selected.

Next, the Newsletter Assistant poses some practical questions, such as what title to give the newsletter, how to format the date and issue and/or volume #, and how many pages you want your newsletter to be. The process of answering the Newsletter Assistant's questions is the process of

building your newsletter.

The ClarisWorks Assistants have a consistent interface throughout. For example, an Assistant's questions are always found at the top of the dialog box or screen, and the multiple-choice-like responses, as well as the thumbnail, are always found towards the middle of the screen along with the tip text identified by an artful exclamation point.

At this point in our newsletter example, the Assistant goes on to inquire about some style considerations. Do you want a table of contents on the first page? How about a
highlighted editorial column? Are you planning to mail this newsletter, and, if so, will you want to set aside one-third or one-half of the back page for the mailing label?

To help you add visual impact to your newsletter or other documents whether created with the help of an Assistant or not. ClarisWorks 3.0 ships with lots of "content" in the form of over 70 pieces of clip art, and seven fonts licensed from Monotype Corporation. If you are a "non-artist" type, these can be used to help you create professional-looking flyers, presentations, newsletters, and other types of documents with ease.

Finally, the Assistant offers a separate "Hints and Tips" document that you can print out with your finished newsletter. This Hints and Tips document provides expert advice on how to write and structure the articles in your newsletter. It can be created once and saved or printed for future reference.

The ClarisWorks Assistants can help you create other documents as well. Not only can Assistants help you get your work done, but Assistants can also help you get acquainted with ClarisWorks features. Other Assistants can help you perform tasks like inserting a footnote, creating a table or (on the Macintosh version only) finding your files. As Assistance technology grows, "getting up to speed" on your computer can take less time and be more fun.

Image Editing with ClarisDraw

You can do it, and more easily than you might think, by editing images in a ClarisDraw paint frame! All you need are two pictures, and you are all set.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Want a picture of yourself standing atop Mount Everest? How about an image of a friend standing with George Washington? Want to put a moustache on the Mona Lisa?

Welcome to the world of image editing: the process of taking an existing "bitmapped" image and changing it. Image editing can provide impressive results. Many images you see in advertisements are edited in this way. It's not only a way to get some unlikely image, such as Abraham Lincoln standing next to a freeway, but it's also a way to enhance an existing image. You could eliminate a confusing background, for example, or brighten a cloudy sky.

Ever want to put someone on the moon? Follow the steps outlined here to take two pictures, one of a man and another of a moonscape, and combine them to form a new picture. By following this general procedure, you will be able to do similar edits for other bitmapped images.

The bit-mapped image

Bitmapped images are those which are made up of tiny dots, very much like the way photographs are printed in newspapers. Paint programs create bitmapped images, and scanning software can generally provide you with a file in this format as well. You can also get good bitmapped images from photo CD's. The ClarisDraw paint tools allow you to color, add, delete, and rearrange these dots in an infinite number of ways so that you can change the image in almost any way you want.

Not sure you are dealing with a bitmapped image? Here is a simple test: when placing an image into ClarisDraw, if you have a bitmapped image, you can you zoom in and see a pattern of dots or bits. You can compare this to an object-oriented graphic, which is made up of individual, mathematically defined objects as opposed to bits. Such an image, an EPS for example, won't display as a pattern of bits.

Finding the right image

A photo CD can be a good source for images, as can pictures available via various online services. If you have got an actual photograph or other picture you'd like to work with, then you'll need to scan the image. You can then save it as either a TIFF file or PICT; ClarisDraw supports either format.

You can also work with GIF files, such as those you download from an online service, but here are a few caveats: ClarisDraw can open only GIF files of the format 87a. The only way you'll know if your GIF file is this format or not is by attempting to open it. If you get a message that says, "The document file name "" is a version that is not compatible with the translator GIF" then your GIF file is not format 87a. You'll need to find a GIF utility to open this file and save it in some other format, such as PICT. There are many shareware GIF viewing utilities available on the online services.

Prepare for takeoff

Once you've got the images ready to go, you'll need to prepare ClarisDraw for your files. Working with bitmaps, as with any paint file, takes a lot of RAM. You'll probably need to allocate more RAM to ClarisDraw, as its default RAM allocation might not be enough. To do this, quit ClarisDraw, then click on the ClarisDraw icon and select Get Info from the File menu. Change the Preferred memory size to 3,000 for now. (For more information on doing this, see your Macintosh User's Guide.) If at any point you get any error message telling you there isn't enough memory to do what you want to do, then you'll need to increase the memory allocation for ClarisDraw even higher. As a general rule, to edit a single image, you'll need a memory allocation of at least 3000 K. If you are editing multiple images in a single document, as the steps here do, you'll need to allocate more memory to ClarisDraw.

Put a man on the moon

Once you've made any necessary adjustments to the memory allocation of ClarisDraw, you're ready to go. Here are the steps.

1. Open a new document in ClarisDraw.

2. Select Place File.... from the File menu. When prompted, select the file you'd like to edit. You'll see it open on your screen. If you'll be editing several pictures, you can select "Place File..." again and select your second picture and follow the instructions below.

3. Click your images one at a time and choose "Ungroup Picture" from the Arrange menu for each. You can now click an image once more and the paint tools will appear on the left side of the screen. You're ready to edit!

Steps 4-6 focus on creating the picture.

4. Use the zoom controls to see the image of the man better. This helps in making a more precise selection.

5. Using the lasso tool, select the image of the man by carefully outlining the exact shape of his image.

6. Choose Copy from the Edit menu to copy your selection to the Clipboard.

7. Bring the landscape of the moon into view, so that you can click on the region where the image on the Clipboard will "land."

8. Choose Paste from the Edit menu.

Note that at this point, the pasted image, in this case the man's image, is still selected. This means you can move it, or make changes to it (see notes below). If you'd like to have multiple copies of the man, for example, here is a shortcut you can try: Hold down the Option key as you drag the selected area. A copy of the selected area appears and you can drag this copy to another location.

Note: Once you click anywhere outside of the selected image, it becomes unselected, and it will be much more difficult to select again.

Making selections

In the example above, the lasso tool is used to select the image of the man. This is just one of the two ways to select portions, or regions, of your image. The other way is to use the selection rectangle, which, as its name implies, lets you select a rectangular-shaped portion of your drawing. Using this tool will select your object and any white (blank) space around it. If you want the white or blank space around the selection to be ignored, hold down the Command key as you draw a selection rectangle around the image or portion of the image you want. Using the Command key in this manner makes the selection rectangle "shrink" to the size and shape of the image you are drawing it around. Be sure to keep the Command key down until the selection box shrinks. Note: This command works only for selecting images sitting alone on white space.

Edit an image

Remember, you are working with tiny pixels of color here. Everything that you do revolves around editing these dots. You can basically do four things: move dots, delete dots, add dots, or change their color. In the above steps, the focus is on basically moving dots from one place to another. The other three things that can be done, deleting dots, adding dots, or changing their color are reserved for doctoring an image, improving the color or cleaning up the "noise" that may have come over when you copied, pasted or moved dots around. Doing any of these three things can make a world of difference in the image.

Image-editing tools

There are lots of other ways you can edit images or selected areas of images: you can use the resize, shear, distort or perspective tools to give your image a whole new look. To use these tools, make your image selection and select any of the above tools from the Paint menu. You can lighten or darken your image; you can blend its colors; you can change the location of an object. Give each effect a try, if you don't like what you see, immediately select "Undo" (Command-Z) from the Edit menu, and your image reverts to the way it was before you applied the effect.

Don't forget the painting tools

ClarisDraw also provides painting tools with which you can edit your image. They include the Pencil, for drawing lines one-pixel wide; the brush, for painting your image with color; the paint bucket, for filling in large areas; the spray can, for "spraying" wide areas with diffuse color; and the Eraser, for changing anything you've done back to white. Note that double-clicking the paintbrush and spray can tools provide you with options as to how they'll work. Double-clicking the pencil zooms your drawing to 800%, very handy for closeup work.

Two other tools help you manage colors. The magic wand tool allows you to select objects by color, which is helpful for selecting oddly-shaped or hard-to-select objects. The eyedropper tool lets you click on a color and have that color selected in the color palette, helpful for finding a color so you can edit it. To edit a color, double-click that color from the color palette.

Try a little experimentation with the paint tools. You can impress your friends with edited images that look almost perfect. It is up to you!

Tips

After diving into the world of image editing, you may want to keep a few things in mind:

- Any images that use paint frames will require more RAM for editing (and more disk space for storage).

- When pasting one image into another, you may have incompatible color palettes. There is no easy way within ClarisDraw to resolve this. The best thing to do is print the images, then scan them yourself. This will give both images consistent color palettes. Keep in mind, however, that this technique may cause a loss in fidelity.

No Beep when Closing a Document Window

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When closing a document window that hasn't been saved, ClarisWorks 3.0 displays the usual alert, but does not beep.

Exact steps to reproduce:
1) Open any ClarisWorks 3.0 document or new document.
2) Add some text, drawing or table.
3) Click the close box in the upper left corner of doc window.
4) You will get a dialog box asking you to save changes but there will be no audible warning tone.

Reordering Shortcut Icons

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Question:
Is there a way to move icons within the shortcut palettes in ClarisWorks?

Answer:
Hold down Command-Option when clicking in the Shortcuts palette. This allows you drag the outline of a button around so that you can reorder the palette.

ClarisWorks 3.0 New Features

Besides Assistant technology, ClarisWorks 3.0 comes with new features that once again redefine it as the leader in the integrated software category.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

New tools to help you "get up to speed"

Among the new tools is the on-screen tour called "Introduction to ClarisWorks," a self-paced "movie" created in Director from MacroMedia. The movie gives you an overview of the features and concepts of each of the different environments of ClarisWorks, explaining the types of operations that can be performed and providing many demonstrations, a very useful tool for beginners or for people interested in learning more about a particular environment or module, such as the spreadsheet or drawing module.

Because the tour is organized in a modular format (one section for each environment) it makes it easy to learn about ClarisWorks at your own pace. You can view the section on spreadsheets, then quit the tour to get hands-on practice with what you have learned. When you are ready, return to the Introduction and start in on another module. For those completely unfamiliar with the program the tour can be accessed directly through the new Welcome dialog box, the first thing you will see on the screen after launching ClarisWorks. When you find you need a little help, the Introduction is available through the Question Mark icon (Macintosh) and Help menu (Windows).

Share Macintosh and Windows files

While both the Macintosh and Windows versions include the exciting new ease-of-use enhancements, the Windows version is also a major overhaul of the 1.0 version, adding hundreds of new features. Another increasingly important usability factor in today's heterogeneous computing environment is the ability to share files seamlessly between Macintosh and Windows-based computers. Since the 3.0 version on both platforms share an identical file format, file sharing between users of 2.0 and higher or 3.0 on Macintosh, and 3.0 on Windows is easy.

New on-screen help

To make the computing experience easier on all levels, Claris has completely revamped the on-screen help. The Help system has been greatly expanded and improved to provide you with step-by-step instructions for the operations you are trying to perform, without the need to leave the computer screen. Many hints and tips are also included, as well as a special Troubleshooting section. "Topics A to Z," a new entry under the Help menu, provides another way to get right to the information you are looking for.

New manual

To complement the on-screen help, the printed manual has been wholly redesigned to serve as a companion to the on-screen help. The manual addresses concepts and gives many examples of the types of things that can be done in ClarisWorks. It then points you to the exact section in the on-screen help that has the instructions for accomplishing that particular task. The new ? icon tells you when and where to consult the on-screen help for an in-depth explanation.

Other accessibility enhancements

In addition to making ClarisWorks easier to use and easier to learn, we have made it easier to keep track of information for a particular document, such as its author and version number, by using the Document Summary Info command (found under the File menu). While this is very useful, the most powerful application of this command is when it is used in conjunction with stationery documents. The New document dialog box now provides ready access to all of our pre-created stationery files and groups them into convenient categories (General, Home, and Small Business). Using the Document Summary Info command enables you to assign a category to a file before saving it as stationery. This way, your own stationery file will be listed under the pre-existing category you choose, or under a new category which you create, available directly from the New document dialog box.

Document statistics

The new "Word Count..."command, accessed under the Writing Tools submenu of the Edit menu, will tell you how many characters, words, lines, paragraphs, and pages there are in your document.

More customization options

New items in the Preferences menu allow you to customize ClarisWorks commands and functions, such as the function of the arrow and Enter keys in spreadsheets. These new controls, for example, also let you determine which dialog box displays at startup, which fonts display in the font menu, and which alerts come up when opening files created in previous versions.

Error When Creating Database Document

If you own a Performa 630 CD or 637 CD, a corrupt System file may cause the ClarisWorks database to crash.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Issue:
I have a Performa 630CD or 637CD computer and when I try to create a database in ClarisWorks I keep getting a Type 3 error or a Type 1 error. I can create any other document including Word Processing, Drawing, Painting, Spreadsheet, and Communications. Restarting with the Shift key down, Rebuilding the Desktop file, and resetting PRAM (Parameter RAM) all fail to help.

Solution:
Reinstall the System File or use the Performa CD to restore System software and restore only the System file. Then reboot (restart) the computer.

NOTE: If using the CD-ROM, restart from the CD-ROM before reinstalling the system file.

Why:
The System file on the Performa 630 CD or 637 CD computers may be corrupt.

ClarisWorks 3.0 Compatibility List

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Below is a list of CPUs, Video Drivers, and Printers which are certified as compatible with ClarisWorks 3.0 for Windows:

CPUs

ALR (486/66)
Ambra (486/66)
AST Premium 386/33
Compaq 325 LTE (386/25)
Compaq Deskpro 386/25e
Compaq Deskpro 386/33
Compaq ProLinea (486/66)
Compaq DeskPro XE (560)
Dell 325 (386/25)
Dell 433 DE (486/33)
DELL 466ME (486/66)
Dell 466MX (486/66)
Dell 486 D50 (486/50)
Dell 486 P50 (486/50)
Dell 486 PE (Pentium/60)
Dell 486 XPS (Pentium/60)

Display Card 8/24GC: Third-Party Monitor Support

Will Apple's new video cards, specifically the Macintosh Display Card 8/24GC, support third-party monitors? I am particularly interested in RasterOps and SuperMac 19-inch monitors.

This article has been archived and is no longer updated by Apple.

The Macintosh Display Card 8/24GC supports any display that meets one of the following specifications:

Sense pins 10	7	4	Display	Pixels	Hor x Vert Clock	Dot Refrsh	Vert Refrsh	Horiz
0	0	1	Apple Portrait Display	640 x 870	57.2832	75	68.9	
0	1	1	Apple Two-Page Monitor	1152 x 870	100	75	68.7	
1	1	0	12" Apple Monochrome Monitor	640 x 480	30.24	66.7	35.0	
1	1	0	13" AppleColor RGB Monitor	640 x 480	30.24	66.7	35.0	

0 - Grounded 1 - Not Connected

Note that sense pins 4, 7, and 10 are referred to as SENSE0, SENSE1, and SENSE2 in pinout tables for the video connectors.

None of the RasterOps or SuperMac 19-inch displays meets the above specifications. Based on this, we do not think that they will work properly.

Here are the pinouts for the Macintosh Display Card 8-24 GC:

Pin	Description
1	Red Video Ground
2	Red Video
3	Composite Sync
4	SENSE0
5	Green Video
6	Green Video Ground
7	SENSE1
8	Not Connected
9	Blue Video
10	SENSE2
11	Composite Sync and Vertical Sync Ground
12	Vertical Sync
13	Blue Video Ground
14	Horizontal Sync Ground
15	Horizontal Sync
Shell	Chassis Ground

SuperMac has announced two new monitors that work with the new Apple video cards: the "Color Two-Page Display" and the "Platinum Two-Page Display."

ClarisWorks Cross-Platform Considerations

ClarisWorks 2.0 and 2.1 share the same file format as ClarisWorks 3.0. As a result, any document created by ClarisWorks 2.0, 2.1, or 3.0 on the Macintosh can be used by ClarisWorks 3.0 for Windows.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
ClarisWorks 3.0 has the same user interface and file format across Macintosh and Windows platforms. This cross-platform compatibility means that sharing files between Macintosh or Windows versions is transparent and readily accomplished without the use of translation software. There are, however, a few rules to keep in mind.

MSDOS file name conventions.
When using ClarisWorks files cross-platform from Macintosh to Windows, files should have a name of no more than eight characters with a .CWK extension. This "eight dot three" requirement is an MSDOS naming convention.

For example, a Macintosh ClarisWorks 3.0 document, could be named, ClarisWorks Sample, but it would not appear in the Open File dialog box in ClarisWorks 3.0 for Windows unless you chose Show All Files as the file type. The file itself would have a truncated name, with an exclamation mark and the first seven characters becoming the file name, and the next three becoming the extension (e.g., !clarisw.ork). While this strangely named file can be opened in ClarisWorks 3.0 for Windows, a better file name on both computers would be "CWSAMPLE.CWK," which can be opened by either platform.

Paint document sizes.
A large paint document created in ClarisWorks 3.0 for Windows may be opened in ClarisWorks 3.0 for the Macintosh provided that the memory allocation is increased. The instructions for how to increase the application memory size can be found in the ClarisWorks Installation Guide (Macintosh).

On a Windows computer, the default size of a Paint document is 468 pixels by 324 pixels (6.5" wide by 4.5" high). On a Macintosh, the default size of a Paint document opened under the default memory allocation to ClarisWorks opens up to 4.5" by 4.5". These sizes can be changed in either platform by choosing Document from under the Format menu and filling out the desired size information in either platform.

Font transfer issues.
A document created on a Windows computer using particular fonts, sizes and styles may not convert to the Macintosh exactly. As an example, Times New Roman under Windows should convert to Times on a Macintosh. The style and size convert properly, but the Macintosh will not retain the Times font name. When moving a document from Windows to Macintosh, only fonts with exactly the same name on each platform (i.e., Helvetica), will be recognized by the Macintosh with any consistency. There is a little more flexibility when moving a document from Macintosh to Windows.

Windows font substitutions are handled by a section of the WIN.INI file called [FontSubstitutes]. One of the default settings is "Times=Times New Roman." The WIN.INI file can be edited to achieve whatever substitution you want. A document created on the Macintosh with Times will convert properly to Times New Roman on a Windows machine assuming the Font Substitution is set in the WIN.INI file.

WIN32s Error 193 When Installing ClarisWorks 3.0

What to do if you get a Win32s error while installing ClarisWorks 3.0.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

In some cases, the installation process is aborted after the installer restarts Windows at the point when the WIN32s is installed. An alert box shows the error: WIN32s-Error [pathname]\\MS·STF.dll: Invalid format. The path name describes where the file is located on your disk. This location could be the C:\\WINDOWS\\SYSTEM directory or a directory whose name begins with a tilde character (~). After you click OK at the alert dialog, you get a second alert message: Cannot startup ClarisInstaller-Error 193.

The solution to the above issue is to locate and delete the following six files from your hard drive:

mscomstf.dll
mscuistf.dll
msdetstf.dll
msinsstf.dll
msshlstf.dll
msuilstf.dll

If these files are not in the above directory, you can locate them by using the Search command in Windows File Manager, searching for ms*stf.dll .

Where ms*stf.dll files come from.
These files are used by the Microsoft installer, which many software vendors, including Claris, use to install Windows applications. A properly engineered installer copies these files to your hard disk during the installation process, then removes them when installation is complete. Some installers leave these files on your hard disk, resulting in a conflict with subsequent installations.

Note: This is fixed in ClarisWorks 3.0v2.

How To Print Rolodex Cards

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Claris Organizer does not have a pre-entered format for Rolodex cards. You can create a label layout to print to Avery 5385/Rolodex cards.

Here are the steps to creating the label for Avery 5385/Rolodex Cards:
1. Select Print from the File Menu and click on Labels or press L.

2. Click and hold the mouse on Avery 5160. Drag to the bottom of the menu and select Create New Layout.

3. Type in the Following Measurements
Row: 4
Col: 2
Width: 4
Height: 2.166
Top: 1.167
Bottom 1.167
Left: .25
Right: .25
Top, Bottom, Left, and Right should be set for .1

4. Press Save and Name this label Rolodex Cards or Avery 5385.

5. You may want to create your own Text layout for the Rolodex Cards. Click on Business and select Create new Layout. You can pick your fields here and save.

Importing Tables from Microsoft Word

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Question:
I have my contacts in a table in Microsoft Word, and would like to put them into Claris Organizer.

Answer:
In order to import your tables from Microsoft Word, you will need to convert the tables to text only (Tab-Seperated format). Here are the instructions on how to do this:

Converting a Table to Text in Microsoft Word:
1. You can convert the table in Microsoft Word to regular tab-separated text. Once converted, you can copy/paste into a Claris application's document. For instructions, go to the Microsoft Word online help; scroll down to the Tables topic; select the subtopic Converting a Table to Text.
2. After converting the table to text, set tabs in the ruler to align each column. Then copy/paste the document to the Claris application's document.
Note: to preserve the original Word document with tables, either close the Word document without saving, or Save As with a different file name.

Printing Daily Graphical Calendar

Daily Graphical Calendar will not change its scale.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Claris Organizer does not look at the work hours specified in your preferences when printing the Daily Graphical Calendar. The first time interval that prints is always at 8 am. For example, if you change your work hours in Preferences to 7 am, then set an appointment for 7 am, this appointment will be listed in the Early section at the top of the page.

The Daily Graphical places all appointments before 8 am in the Early section and all appointments after 11 pm in the Eve section.

ClarisWorks On-Line Trial Software

There is an on-line trial software available for ClarisWorks 3.0. Listed below are the files you need and a copy of the README file.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The ClarisWorks 3.0 On-line trial software is two separate self-extracting PKZIP files; CLW3DEM1.EXE and CLW3DEM2.EXE.

CLW1DEM1.EXE contains:

CW3DEMO1.EXE - Self Extracting PKZIP files containing the files for Disk 1
INSTALL.BAT - Installation batch file
README.TXT - Text file containing instructions for the install.

CLW1DEM2.EXE contains:

CW3DEMO2.EXE - Self Extracting PKZIP files containing the files for Disk 2
README.TXT - Text file containing instructions for the install.

Listed below is the README.TXT file:

Thank you for downloading the ClarisWorks 3.0 Trial Software!

MINIMUM REQUIREMENTS

PC with 386 or higher processor (486 Recommended)
Microsoft Windows 3.1 or Later; MS-DOS 5.0 or Later
Hard disk Drive and 4MB RAM (8MB Recommended)
One 3.5" floppy disk
VGA or better video
Mouse

INSTALLATION

In order to install the trial software, follow these steps:

1. Change directory to your root directory by typing:

CD\\

2. Create a temporary directory off of your root directory by typing:

MD TEMP

3. Copy both of the downloaded files, CLW3DEM1.EXE and CLW3DEM2.EXE
into the same directory using the copy command. Example:

COPY CLW3DEM*.EXE C:\\TEMP

4. Type INSTALL

After the installation has been completed, you may delete the TEMP directory
from your system, along with the files contained within it.

The installer will require approximately. 6 megabytes of free hard disk space to
run and install the software. The actual trial takes up 3 megabytes of hard
disk space.

FLOPPY DISK INSTALLATION

If you do not have enough free hard disk space, you can install the software from a floppy drive instead of the hard drive, by typing the letter for your 3.5" drive after the install command. Example:

INSTALL A:

You will need two blank High Density (1.44MB) 3.5" diskettes to install the software from floppy diskettes. The trial cannot be installed from 5.25" diskettes. You may use the set of floppy diskettes to install the trial on as many systems as you wish. Just run the SETUP.EXE on the first disk from

Windows to begin the setup.

REMOVING THE TRIAL

If you wish to remove the trial from your system after it has been installed, follow these steps:

1. Remove the following line from the [386Enh] section in the SYSTEM.INI file:

device=<WINDOWS>\\<SYSTEM>\\win32s\\w32s.386

where <WINDOWS> and <SYSTEM> are where the Windows and System directories are, respectively.

2. Modify the following line from the [BOOT] section in the SYSTEM.INI file:

drivers=mmsystem.dll winmm16.dll

to the following (remove winmm16.dll):

drivers=mmsystem.dll

3. Delete the following files from the <WINDOWS>\\<SYSTEM> subdirectory or from the SYSTEM directory in network installations:

W32SYS.DLL
WIN32S16.DLL
WIN32S.INI

4. Delete all the files in the <WINDOWS>\\<SYSTEM>\\WIN32S subdirectory or the <SYSTEM>\\WIN32S subdirectory in network installations. Then delete subdirectory itself.

NOTE: <WINDOWS> refers to the windows installation directory. On a networked Windows installation, the system directory may be located on a

remote share. If you are only removing Win32s from your machine, then you do not need to remove the shared files (in <SYSTEM> and <SYSTEM>\\WIN32S). Before removing these files from the network share, make sure that all users that use Win32s have removed the references to Win32s from the SYSTEM.INI file.

5. Delete the CW3TRIAL directory located in your root directory.

If you have any problems with this Trial, you can contact CLARIS Technical Support.

Failed Installation Caused by LaserMaster Driver

There is a known incompatibility with the installation of Microsoft's Win32s subsystem and the LaserMaster printer driver.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The LaserMaster printer driver causes the installation of ClarisWorks 3.0 to fail when copying the file WINSPOOL.DRV from Install Disk 1. The solution is to remove the LaserMaster printer driver from your System temporarily and install ClarisWorks. Once ClarisWorks has been installed successfully, the printer and its drivers can be re-enabled.

To temporarily remove the LaserMaster printer driver from your System, do the following:

1. Remove Fast Release and/or Win Print from the Windows start-up group by dragging them into another group (such as Main or Accessories). This technique prevents them from loading during Start-up.

If neither is located in the start-up Group, they may be in the SYSTEM.INI file. Use the following technique to suppress them.
2. Open the SYSTEM.INI file with a text editor (such as NotePad) or with SYSEDIT and edit the appropriate lines for three device drivers in the 386 Enhanced section [386ENH]:

device=lmmi.386
device=lmcap.386
device=lmharold.386

A semicolon (;) should be placed such that it is the first character on each of the above three lines. This instructs Windows to skip the line when processing the

SYSTEM.INI file. Once the semicolons are in place, save the changes to the SYSTEM.INI file.
3. Restart Windows.
When Windows comes back up, follow the directions for installing ClarisWorks 3.0. When the installation of ClarisWorks is complete, the printer can be re-enabled by putting the Fast Release and Win Print files back into the start-up group and removing the three semicolons from the appropriate lines in the SYSTEM.INI file. Be sure you restart Windows for your changes to take effect.

Note: According to LaserMaster Technical Support, it is not necessary to remove the printer driver from the
Printer section of the Windows Control Panel.

This solution should work with all of LaserMaster printers
WinPrinter and WinJet printers including: WinPrinter 1000, WinPrinter 600XL, WinJet 800, WinJet 1200, and WinJet 1200 Plus.

Time Segment Codes for ClarisWorks 3.0 on Video (Macintosh)

An itemized list of the time codes for the topics taught on the video

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

ClarisWorks 3.0 on Video
This self-paced video is designed for people who enjoy learning from an expert, but canÕt attend a training class. The video is approximately 90 minutes long, and will give you a guided tour of the software application. The video is led by a Claris training professional, who understands what you need to know to use your software.

The following are the Time Segment Headings and start codes for the ClarisWorks 3.0 (Macintosh) video:

Creating a Memo with a Chart
00:02:51 - Open a Word Processing document
00:03:28 - Create a Header and Insert Letterhead
00:04:48 - Define Paragraph Styles
00:06:19 - Place Ruler Settings
00:11:50 - Create Stationery document
00:16:08 - Apply Paragraph Spacing
00:16:37 - Insert Footnote with ClarisWorks Assistance
00:19:35 - Add a Spreadsheet to create a Bar Chart
00:24:05 - Enhance Bar Chart
00:27:58 - Add Footer
00:28:41 - Check Spelling and Word Count
00:31:46 - Create personalized letterhead

Creating Mailing Labels and Using Mail Merge
00:35:50 - Open a Database document
00:36:33 - Define Fields for a customerÕs database
00:38:20 - Create new Records
00:40:47 - Insert customer information from another data source
00:46:06 - Design a Label Layout
00:56:33 - Sort and Match Records in a database
00:58:26 - Create a Form Letter, Insert Fields and Print Merge

Creating a Slide Show
01:06:09 - Open a Drawing document
01:07:04 - Create Master Page for slides
01:07:23 - Design a logo using the Drawing Tools
01:08:15 - Apply Color and Gradient to objects
01:13:08 - Work with Text
01:17:39 - Add a QuickTime Movie
01:22:16 - Insert a Paint Image
01:23:08 - Work with Paint Commands and Tools to transform bitmap image
01:31:25 - Set up and run Slide Show

Pricing
ClarisWorks 3.0 on Video (Macintosh); Order #: 200034U SRP/ESRP: $39

"Error Decompressing" Messages During Installation

Installation problems may be caused by a bad memory chip.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If you receive the following error messages while attempting to install ClarisWorks 3.0 for Macintosh, the issue may be caused by a defective RAM memory chip:

Disk 2
Error Decompressing "Introduction to ClarisWorks", the data doesn't match.
Error Decompressing "Address List", the data doesn't match.

Disk 4
Error Decompressing "ClarisWorks Help", the data doesn't match.

This issue was reported by a customer and has not be verified by Claris. The machine used was a Power Macintosh 6100/60AV with 16 MB of memory running System 7.5.

The solution is to replace the defective memory chip.

Auto-Enter Dates Cannot be Found

Dates entered using the Auto-Enter feature cannot be found using Find or Match Records unless the Date field was at the top of the layout when the record was created.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Dates entered using the Auto-Enter feature cannot be found using Find or Match Records unless the Date field was at the top of the layout when the record was created. This includes Auto-Entered Creation Dates and Modification dates.

Workarounds:
1. Use Find/Change to change all the dates that are not working correctly. You could easily automate with this process with a Shortcut Macro.
2. Verify the layout you create records from has the Date field on it and it is at the top. Consider a Macro for creating Records. This Macro could switch to a layout that has just the Date field on it, create a new record and then switch to the layout where you want to enter data.

This issue occurs with all versions of ClarisWorks including 2.0v1, 2.1v2, 2.1v3 and 2.1v4.

Personal Stationery Instructions are Incorrect in ClarisWorks 3.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

The Personal Stationery file that ships with ClarisWorks 3.0 provides instructions in the body of the document about how to modify it to meet your needs. One of the instructions recommends using Control-Click to modify the text in the Footer this will work for Windows users, however, the key you should use with the mouse click is Command if you are using a Macintosh.

The Personal Stationery file is available from the New Document dialog under the Home Stationery category.

Printing to a DeskJet 540 Does Not Work in ClarisWorks 3.0

To correct printing issues when printing to the DeskJet 540 you must install an earlier or updated version of the printer driver you have installed or update your version of ClarisWorks.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Printing from ClarisWorks 3.0 to an Hewlett-Packard DeskJet 540 will not work. To correct this issue you can install the Hewlett-Packard DeskJet 500 driver from the Windows diskettes (so that an earlier driver version will be installed). If you have installed the Hewlett-Packard DeskJet driver and ClarisWorks still will not print, more than likely you have installed the driver that came with the DeskJet which is still the 5.0 driver. ClarisWorks 3.0 cannot print using any of the DeskJet 5.0 drivers, but will print with the earlier 4.1 and current 6.1 drivers.

NOTE: Installing the DeskJet 500 driver from your Windows diskettes will give you printing capabilities for the DeskJet 540, but it will only print in black and white.

If you do not have your original Windows diskettes there are different on-line areas where you can obtain the current version of the driver and the ClarisWorks 3.0v2 updater. On the Claris BBS (408)987-7421 go to the File menu and go to W for Windows Files, then select Drivers. This is where you will find the Hewlet-Packard DJ 6.1 drivers ready for download. Also available from the Claris BBS is the ClarisWorks 3.0v2 updater that works around the printing issues with the DeskJet series printers.

If you cannot download from a BBS, you need to contact Claris Customer Assistance for the updated version of ClarisWorks (3.0v2 a nominal shipping and handling charge will apply.)

Hewlett-Packard also has a new driver available on both their BBS and through the mail. The filename is "DJ100EN.EXE", it is in library 1A. The same driver can be obtained via U.S. mail on 2 diskettes for a nominal fee by calling and requesting part number DJ100EN.

The modem service is provided to Hewlett-Packard's customers to allow improved access to drivers and utilities for Hewlett-Packard personal computer and peripheral products. Interactive messaging and technical support are not available through this service.

Sort Macro NOT Working in ClarisWorks Database

During the recording of a Macro that Sorts a database it is necessary to click the Clear button before designating the Sort Order.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
During the recording of a Macro that Sorts a database it is necessary to click the Clear button before designating the Sort Order. Otherwise, a Sort Order from a previous Sort may conflict with your Macro such that the Macro adds to your previous Sort Order. Here are the steps to recreate this issue.

1. Create a new database with two fields (field1 and field2).
2. Record a Macro that Sorts by field1.
3. Manually Sort by field2.
4. Run your Macro and then choose Sort from the Organize menu to see what Sort the Macro Dialog box shows both fields under the Sort Order.

Testing Whether a Field Has Only Number Values

How do you test that the value entered in a field really has a number and not just text? FileMaker and ClarisWorks both can do this; but it will require different formulas for each.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Testing whether a field has a number value is done differently in FileMaker than it is in ClarisWorks. What works in one will not work in the other.

In FileMaker:
To find out if a field has only a numerical value entered can be done with the Length, TextToNum, and NumToText functions.

A calculation with an If statement would look like this:

NumberOnlyTest (Calculation, Text Result)
= If (Length (NumToText (TextToNum (TestField))) = Length (TestField) , "" , "Value has a text character in it. Please change to only numbers.")

Where TestField is the field you are testing.

In ClarisWorks:
To find out if a field has only a numerical value entered, we test if the result of the TEXTTONUM function when evaluated as a number (ISNUMBER) returns an error. If the result is an error the field does not contain a number. Example:

ISERROR(ISNUMBER(TEXTTONUM('TestField')))

Then we check for the length of the converted value being the same length as the original value. Example:

TEXTTONUM(NUMTOTEXT('TestField'))<>'TestField'

Then, putting both of these together inside a nested If statement would look like this:

NumberOnlyTest (Calculation, Text Result)
= IF(ISERROR(ISNUMBER(TEXTTONUM('TestField'))),"Value contains a non-numeric character",
IF(TEXTTONUM(NUMTOTEXT('TestField'))<>'TestField',"Value contains a non-numeric character",""))

When the TEXTTONUM function does not produce a number then the ISNUMBER function produces an error, which flags the value as not being a number. If there is both number and non-number data in the field, the comparison test flags the field as having a non-number character in it.

NOTE: The two tests must be done sequentially (i.e., in a nested fashion) as the ISERROR function will not work with an OR conjunction when used inside an IF test.

Delete Record and Find Again Have Same Key Equivalent

ClarisWorks 3.0 includes a new command for Delete Record in the Edit menu of the Database environment. Its key equivalent is Command-E, which is also the command key equivalent for Find Again.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
ClarisWorks 3.0 includes a new command for Delete Record in the Edit menu of the Database environment. Its key equivalent is Command-E, which is also the command key equivalent for Find Again. Thus, doing a Find via the Find/Change command in the Edit menu, clicking in the main window, and then pressing Command-E (Macintosh) or Ctrl-E (Windows) to Find Again will actually delete the current record instead of Finding the next occurrence. ClarisWorks does not warn you when deleting records.

Claris engineering is aware of this issue.

Until this is corrected, the current solution is to manually select Find Again from the Find/Change option under the Edit menu. Using the key equivalent will delete the current record consistently.

How to Uninstall WIN32s From Your System

This is a rundown of how to uninstall WIN32s. There is no uninstall utility, and there is more to it than simply deleting the WIN32s sub-directory.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Removing the WIN32s from your system requires more than just deleting the win32s sub-directory. To completely remove WIN32s from a system, follow these guidelines:

1. Modify the following line from the [BOOT] section in the SYSTEM.INI
DRIVERS=MMSYSTEM.DLL WINMM16.DLL
to the following (remove WINMM16.DLL):
DRIVERS=MMSYSTEM.DLL

2. Remove the following line from the 386 Enhanced [386Enh] section of the SYSTEM.INI file:
device=<WINDOWS>\\<SYSTEM>\\WIN32S\\W32S.386
where <WINDOWS> and <SYSTEM> are the locations of your WINDOWS and SYSTEM directories, respectively. In a normal Windows configuration the line will read:
DEVICE=C:\\WINDOWS\\SYSTEM\\WIN32S\\W32S.386

3. Exit and restart Windows.

4. Delete the following files from the <WINDOWS>\\<SYSTEM> subdirectory or from the SYSTEM directory in network installations:
W32SYS.DLL
WIN32S16.DLL
WIN32S.INI
WINMM16.DLL

5. Delete all the files in the <WINDOWS>\\<SYSTEM>\\WIN32S subdirectory or the <SYSTEM>\\WIN32S subdirectory in network installations. Then delete the WIN32S directory itself.

The above changes will take effect the next time Windows is run.

NOTE: <WINDOWS> refers to the Windows installation directory. On a networked Windows installation, the system directory may be located on a shared remote volume. If you are removing only WIN32s from your machine, then you do not need to remove the shared files in <SYSTEM> and <SYSTEM>\\WIN32S. Before removing these files from the shared network, make sure that all users that use WIN32s have removed the references to WIN32s from the SYSTEM.INI file.

Times entered with plus or minus keys will not go past noon.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In Claris Organizer, it is possible to change the time values in an appointment by using the plus (+) and minus (-) keys. You may use the plus key to increase the time and the minus key to decrease the time of an appointment. If these keys do not work properly for you, check the format of the time in your Date and Time control panel. If the suffix for AM or PM has been changed to only show an "A" or a "P," Claris Organizer will not go past 12:00 (noon) and will loop around to 1:00 A.

The workaround is to enter the time manually, or to change the time format to show "AM " or "PM" rather than "A" or "P" respectively.

The Date & Time Control Panel may also be set to military time.

Transparent Pen Color on Polygons, Freehand, and Bezigon Shapes Print Black on DeskWriter Printer

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When printing to a DeskWriter, shapes created with the Polygon, Regular Polygon, Freehand and Bezigon tool that are set to have a transparent Pen pattern will not print with a transparent border. The printout will show an outline. The best workaround is to change the Pen Color to white or the Pen width to none. This will eliminate any color or line width and you will no longer get the outline.

Using Express Modem Tool with ClarisWorks 3.0, System 7.5, and Power Macintosh Gives Error -11

When trying to open a saved communications document on a PowerMac under System 7.5, where the Express Modem Tool was selected as the communications connection, the document will not open and will generate an error of -11.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
When trying to open a saved communications document on a PowerMac under System 7.5, where the Express Modem Tool was selected as the communications connection, the document will not open and will generate an error of -11. Claris does not provide the Express Modem Tool as part of the ClarisWorks package and has not tested or certified its compatibility with ClarisWorks.

ClarisWorks 3.0 does save and open communications documents properly when using the Apple Modem Tool 1.5.3. This tool also fully supports the Express Modem. The recommended settings are as follows:

Modem: Apple Express Modem
Error Correction: Optional
Correction Type: Hardware
Baud: 19,200 if connecting to an auto baud modem otherwise match
modem speeds if 9600 or slower
Handshake: DTR&CTS
Port:Modem
Parity, Stop: Determined by connection

SMB File Transfer: Using With PC-LAN Server

I use the PC-LAN program "extended services" on our PC-LAN server. Can the SMB File Transfer program work with a server in that mode, which I prefer for the advanced services and security, or must directories be shared with Macintosh computers through "base services"?
This article has been archived and is no longer updated by Apple.
The SMB File Transfer program works with:

- PC-LAN Base Version 1.2, and later (1.3, 1.31)
- PC-LAN Extended Version 1.3, 1.31
- OS/2 Extended Edition 1.1
- OS/2 LAN Server 1.1

SMB File Transfer lets you use the Extended Version's read/write/create options. Use the Netshare command to configure the PC:

```
NETSHARE shortname=d:\\ password|* /r/w/rw/wc/rwc
```

Avoiding "This copy is busy. Please try again Later." error when launching ClarisWorks

The Quick Tools screen saver "QT Sunset" causes an error when launching ClarisWorks.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If you get the error message "This copy is busy. Please try again Later" when launching ClarisWorks, it is likely that you are experiencing an Extension conflict. We have found that a screen saver called "QT Sunset," part of the Quick Tools set of Extensions, causes the conflict that produces the error message.

To fix this issue you need to remove the QT Sunset Control Panel from the Control Panels folder in your System Folder and restart your Macintosh. Also, please note that all Control Panels that start with the letters "QT" may be questionable.

Simply turning off the QT Sunset Control Panel may not eliminate the conflict. The QT Sunset control panel must be taken out of the Control Panels folder completely.

This issue has also been reported using LabelSecrets from Mac Secrets.

Power Macintosh Requires More RAM for Older Products

Many older programs require extra memory to run on a Power Macintosh. Here's why and how to correct it.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
An application that is not created to take advantage of the Power Macintosh processor will require more memory in order to function on the Power Macintosh.

If you have installed an application on a Power Macintosh, and it does not open as expected, check a few possibilities:

1) Is the application compatible with Apple System 7.1 or System 7.5 software?

Often, old software will be moved from an older macintosh onto a Power Macintosh. Be very careful that your software is current enough to run on any Macintosh running System 7.1 or higher software.

2) Was the application created to run on a Power Macintosh?

If a Macintosh application is called "Power PC Native," it should function without issues on any Power Macintosh. Check for INIT, Extension or Control Panel conflicts if you have added any software to your system folder. If you cannot discover a issue, contact the application's manufacturer.

3) Have you allocated more RAM for non-native products?

If you are using a System 7.1 or System 7.5 compatible product, and your product still does not open properly on a Power Macintosh, verify that it is using enough computer RAM.

To check for available RAM, first quit all open applications. Then select About this Macintosh under the Apple menu. An number labeled Largest Unused Block will show you how much memory is available beyond the system requirements. You can give your software applications up to that amount, if needed.

To adjust the RAM requirements of a product, again verify that the product is not running (look under the icon of the Application menu in the upper right corner of your screen. If the product is listed, select it from the list, then select Quit from the File menu.) Single-Click (click only once) on the application's icon on the hard drive. Then select Get Info from the File menu. The info window should show you Suggested, Minimum, and Preferred memory requirements. For non-native applications, you will want to increase the Minimum and Preferred numbers higher than the Suggested number. (I arbitrarily double the Suggested value to set the minimum, and triple the suggested value to set the preferred. For a 1000K suggested, I set the minimum to 2000 and the preferred to 3000. You may wish to try various settings to see what best suits your other memory needs.)

Autosize Line Fractions Change to Decimals

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

In the Rulers dialog, you can set ClarisDraw to "Use Fractions When Appropriate" when displaying lengths in an autosize line. If you draw an autosize line, then resize it a few times, it may revert to decimal display. For example, instead of displaying an autosize line as 15' 2", it displays 15.17'. The workaround is to select the autosize line, then, in the Object Info window, retype the length in feet and inches. This will reset the autosize display to feet and inches. If you resize the line further, it may revert to a decimal display again, requiring the same workaround.

Test conditions:
Tested ClarisDraw 1.0v1 and 1.0v2
Ruler settings of 8" = 30ft and .25" = 1ft tested, 12 divisions per foot
Drew horizontal autosize lines
Resized with shift key down to attempt to constrain to horizontal. Resized both larger and smaller about 2 - 10 times until the issue occurred
Hardware: Quadra 800/7.1 w/System Update 3.0
Published Date: Feb 18, 2012

ClarisDraw 1.0v2 Disk Space used by Installation

This article details the space ClarisDraw requires for installation.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The Installer works by copying the compressed disk files to your machine, then decompressing them and deleting the compressed versions. So you will temporarily need enough room on your hard disk for BOTH the compressed and decompressed versions, minus any redundant files that the Installer finds already on your hard disk. (Example: dictionary or translator files.) Since the actual total can vary from machine to machine, it's best to assume that the maximum amount of space will be required.

Installation Grand Total (compressed and decompressed, approximate):
==========

68K: 14.2 MB
Power Mac: 16.5 MB

Installation Disks (TOTAL of all six):
==========

```
68K:        4,608K
Power Mac:  4,596K
```

Individual Parts After Installation (in K):
==========

	68K	Power Mac
Application	1,248	3,746
ClarisArt*	2,105	2,105
Help System	2,343	2,343
Samples	457	457
Palettes	24	24
Fonts	1,200	1,200
Dictionary	336	336
XTND	1,163	1,163
TOTAL	8,876	11,374

*This figure is for the "minimal" ClarisArt, which is the default choice upon installation. The entire ClarisArt set requires 7.5 megabytes of disk space.

Published Date: Feb 18, 2012

Bitmaps: Basic Editing Concepts

ClarisDraw is unlike MacDraw Pro in that it has the capability to edit bitmap, or "paint," images. This article should help answer some basic questions about bitmaps.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

What is a Bitmap Image?

An image consisting of colored dots. Typical examples are scans (which can be saved as TIFF or PICT files) and paint documents (which are created by applications such as MacPaint or Brushstrokes). ClarisDraw works only with bitmap frames - in other words, bitmap images are only contained within a frame in the document. ClarisDraw cannot save out as a "pure" bitmap file like a paint application can.

Any bitmapped image is probably going to require that additional RAM be allocated to the application; in fact, the larger the image, or the more colors it contains, the more RAM will be required to even open the file, much less edit it. Sometimes the additional amount of RAM needed can be substantial - many megabytes. Additionally, bitmap images can require substantial amounts of disk space to store, again, depending on the number of colors in the file and the image's resolution (expressed in dpi, or dots per inch).

How To Edit a Bitmap Image in ClarisDraw

- Create a new document
- Place the bitmap in the document

- Alternatively, simply open the bitmap file
- Click the bitmap image to it is selected
- Choose "Ungroup Picture" from the ARRANGE menu
- The image is now ready for editing. Click again to activate the paint tools

You can also cut/copy/paste a paint image into a ClarisDraw paint frame. However, the "Ungroup Picture" method is superior because (1) it's easier, and (2) it retains the original bitmap's resolution. Copy/paste reduces the images resolution to 72 dpi. This may look okay on screen (which can display only 72 dpi at 100 percent magnification) but you will certainly see the difference when printing to any high resolution printer (laser or inkjet printer).

Side Issue:

Choosing "Ungroup Picture" also changes white pixels to transparent. Try this example:

- Create a simple MacPaint image; save it
- Create a new ClarisDraw document
- Draw an object
- Place the MacPaint image in the file; move it over the other object you've drawn. Notice how you cannot see what's underneath the MacPaint image
- Now click the MacPaint image and choose "Ungroup Picture" from the ARRANGE menu

- Notice that you can now see beneath the MacPaint image. The white pixels have become transparent.

Calculating Elapsed Time in ClarisWorks DB

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you need to know the number of hours elapsed between two time fields in a ClarisWorks database, use the following fields (field types):

StartTime (Time)
EndTime (Time)
ElapsedTime (Calculation, number result) = (EndTime-StartTime)*24

ClarisWorks stores the time fields as a percent of a day. Midnight is 0.0, Noon is 0.5, and 6:00 PM is 0.75. If two times are subtracted, you get the percent of a day between the two times. To convert this to a number of hours, multiply by 24 hours in a day.

Crash Printing from Help to DeskWriter Printer

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In ClarisWorks 3.0, ClarisDraw 1.0 ClarisImpact 1.0 and Claris Organizer 1.0, it is possible to print individual pages from the new help system.

However, if you're printing to a Hewlett-Packard DeskWriter printer, doing this will cause the application to quit. The help page will not print, and there is no workaround at this time. Version tested was the DeskWriter 6.0 driver, although all current DeskWriter driver versions are probably effected. The issue occurs with all models of DeskWriter printers.

The issue does not occur in ClarisWorks 4.0, which uses a different help engine.

The workaround is to make a screen shot of the page in help that you want to print, then print that. To to that, view the help page you want to print. Press command-shift-3. In the Finder, you'll see a new file called Picture1 in the hard drive window. Open this file back into ClarisWorks, then print it.

Documents Created From Stationery Files Default to Stationery When Saved

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you choose to open your stationery documents in any way except the new document dialog box in ClarisWorks 3.0, then you will need to manually change the radio button in the Save dialog box from "Stationery" to "Document." This applies only to the first time the document is saved.

Once the stationery has been opened in any manner other than the new document dialog, then it will NOT default back to "Document" in the save dialog (even if accessed through the new document dialog) until you quit out of and restart ClarisWorks.

This includes creating new documents created from stationery from the open dialog box or an alias. This did not occur in previous versions of ClarisWorks.

A/UX: Technical Questions & Answers (9/94)

I need some additional information about A/UX support for X/Open XPG3 features like Message Queues msgctl(), Semaphores, shared memory, and so on. I need details in these areas:

1 - dbx (source level debugger).

2 - X.25 connection supported by "XTI" and libraries sockets. (What is "XTI"?)

3 - Support of s-bit for owner and group.

4 - System/library calls for disk "quota".

5 - Support for GF_PATH, PF_PATH, and IN_PATH. (What are they in A/UX?)

6 - Are there public domain programs, like emacs, plot, and shar, available?

7 - What's the official name for the full screen standard editor in A/UX?

8 - Is printer spooling oriented on System V or BSD UNIX?

9 - Is there Multilevel security (DoD or Bell-La Padula with B-class certificate)?

10 - PHIGS and CGM under A/UX.

11 - Future support of System V version 4.

12 - What is the status of Oracle?

This article has been archived and is no longer updated by Apple.
First, thanks to Richard Kefs (KEFS1), Apple Technical Partner Program Manager, for some of the answers that are included in this document. Here is the information you requested:

We should be fairly close to X/Open XPG3 compliance. The generic AT&T UNIX System V Inter-Process Communication facilities, which include Message Operations, Semaphores, and Shared Memory, are supported by A/UX.

1 - dbx is not supported. CDB, the popular, powerful, source level C debugger from Third Eye Software, was available for A/UX from APDA. It may no longer be available. We suggest contacting Third Eye Software for more information.

2 - We have several X.25 solutions under A/UX (Symicron, Mark Powell, (44) 1-857-55-77), but I do not know what "XTI" is.

3 - The set UID and GID bits are supported under A/UX.

4 - It seems that the disk quota control for each individual user account is not enforced in A/UX, but the BSD file system does maintain the "low-water mark" of about 5% of free file system. In other words, users may not allocate disk space if there is less than 5% of the BSD file system space remaining.

5 - We are unsure what the GF_PATH, PF_PATH, and IN_PATH constants or environment variables referred to.

6 - emacs is available in the public domain.

7 - Both the UNIX ("vi") and the Macintosh ("Cut-and-Paste") style of

editors are supported. The Macintosh cut-and-paste text editor is called "TextEditor". A/UX supports TEXT cut-and-paste between different environments (UNIX, X Window System, and Macintosh applications), and GRAPHICS cut-and-paste between Macintosh applications.

8 - Both System V and BSD UNIX printer spoolers are supported under A/UX 3.0.

9 - Regarding the secured A/UX system, AFSG (Apple Federal Systems Group) had an unreleased version of A/UX that complied with Federal Government requirements for a Class B1 level of trust on A/UX. This version was available to government customers only. You will need to contact a Federal Systems Group sales rep for further information.

According to NCSC (National Computer Security Center), the evaluation criteria define seven levels of trust called"Classes". In increasing order of trustedness, they are: D, C1, C2, B1, B2, B3, and A1. D systems are not trusted. A1 systems are extremely resistant to compromise. C1 has "Discretionary Access Control", such as AppleShare. C2 adds Security Auditing and Control Object Reuse. B1 adds Security Labels and Mandatory Access Control. B2 adds Trusted Path, Convert Channel Control, and Modularity. B3 adds Trusted Recovery and Strict Isolation of Domains.

10 - If you are really looking for PHIGS and/or PEX (3D PHIGS/PHIGS+ Extension for X) type of features, a third-party called Prior Data Sciences in Canada may have the solution for A/UX.

Prior Data Sciences

ClarisWorks: Font Menu Appears in Chicago Font Using Type Reunion

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When using ClarisWorks 2.1v3 with Type Reunion 1.2 on a Macintosh Performa 638 running system 7.5, the font menu will appear in Chicago font rather than in all the listed typefaces.

This issue also occurs when using ClarisWorks 3.0 with Type Reunion 1.1 on a Macintosh 660AV running system 7.1.

ClarisDraw: Gradients Do Not Retain Rotated Orientation When Exported as EPSF

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In ClarisDraw 1.0v2, when gradient-filled objects are rotated and saved as EPSF, the non-rotated direction of the gradient is saved instead of the rotated direction.

Exact steps to reproduce:
1) Draw a rectangle
2) Apply a gradient to the object
3) Rotate the object 90¡

Notice that the gradient appears accurate on the screen.
4) Save as EPSF
5) Place file back in to the same document

Notice that the gradient EPSF file still looks good.
6) Print to a LaserWriter

Notice the original gradient object (not the EPSF object) prints fine, but the EPSF object prints the gradient only with the original, unrotated angle.

ClarisImpact: Right-Aligned Tabs Do Not Work Properly

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Consecutive right-aligned tab stops do not work properly in ClarisImpact drawing document text frames. If you have two tab stops, tab to the first and enter text, then tab to the second, any text you type will be left-aligned at the first tab stop, rather than right-aligned to the second. Subsequent tab stops will be similarly incorrect.

The work around is to turn off Fractional Character Widths in Preferences.

Too Much Space Between Graphics and Text

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If there is too much white space between a graphic and text wrapped around it in your word processing document, you may need to change your paragraph line spacing units. Select Paragraph... from the Format menu. A dialog box appears which allows you to modify paragraph spacing attributes for the currently selected paragraph(s). In the pop-down menu next to the Line Spacing setting, the default unit for adjusting line spacing is "li" (lines). Using any other units, such as points or inches, for setting line spacing will result in a large amount of white space between graphics and the wrapped text.

The solution is to set the Line Spacing units back to lines in the Paragraph dialog. You can still flexibly change line spacing by specifying 1.5 lines, 2.0 lines, 2.5 lines, etc., however, the smallest fraction of a line you can specify is a half (0.5) line.

Address Book Does not Print Alphabetically

When Printing a Address Book the First names are not in Alphabetical order

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Q. Why can't I print my Address Book so the First Names always print in alphabetical order?

A. The names in the example, below appear in an order determined by last name then by creation order.

Example:

Steve Wood
Dave Wood
Robert Wood
Erica Wood
Arnold Wood

This will occur when printing either of the following print options: Contacts in List, Selected Contacts, Marked Contacts or All Contacts. They will appear correctly in the Contact List, but will not print on that order.

Claris is aware of the issue. There is currently no work around.
Published Date: Feb 18, 2012

How to Print Double Sided to StyleWriter Printers

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The following instructions will help you in printing any of the double sided options out of Claris Organizer to any printer in the StyleWriter family.

The best way to perform a print test is to select or mark enough contacts, usually 20 -25, to cover two double sided pages. This will equal four pages in preview.

Once you have selected or marked you contacts go to the File menu and select Print. Then double click on Address Book icon. On the next screen in the For pop-up menu select either Marked Contacts or Selected Contacts. Click on Edit button, to make the options window appear.

In the options window select the Following:
1) In the Book pop-up menu select 5.5 x 8.5 (Organizer 2/Page).
2) In the Output pop-up menu select Double-Sided
3) In the List By pop-up menu select Name & Company
4) In the Fields pop-up menu Check put a check mark next to all the fields.
5) Leave Font, Size, and Style at default.
6) Put a Check Mark in Cut Holes, Last Name First, and Holes
7) In the Holes pop-up menu select 6 holes.
8) Click on the Save button

Now click on Setup and change your page orientation to Landscape (The icon, that shows person on their side). Also make sure you have US Letter selected for you paper size.
Click OK.
Click Save.

For this first test print job, you'll want to make sure the total number of pages is four. To do this click on the Preview button. If you have less then four pages or more then four pages. Go back to the Contact List and select or mark more or fewer Contacts. Then go back to preview and see how many pages you have. Once you have four pages, follow the printing instructions and diagram below for printing the address book. Then, reset the paper, and print the second side of the paper. (see Diagram below)

Printing:
When the StyleWriter prints, all of the pages are face-up, and page one is on the bottom. To print the back side of the pages in your address book. You must take the stack out of the output tray and flip it over length wise. This means you take the edge farthest away from the printer and put it at the top of the input tray (See Diagram below). Do not change the order of the paper. Page one should be at the top of the order and at the top of the input tray.

TA43219_How_to_Print_Double_Sided_to_StyleWriter_Printers.pdf

Note: Claris Organizer 1.0v2 fixes the off setting issue when printing double sided from a StyleWriter family printer. This test done with Claris Organizer 1.0v2.

Troubleshooting Lost Network Connections in Windows for Workgroups

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Windows for Workgroups may sometimes lose or drop network connections. This issue is most likely to occur if one of the following conditions exists:

1. You are running a network installation (SETUP /N) of Windows for Workgroups.
NOTE: Microsoft does not recommend running Windows for Workgroups from a network installation (SETUP /N) because doing so is a common stress condition that can cause a loss of network connections.

If a system is run this way, store data and applications on a client or server that does NOT contain the shared Windows directory (created with SETUP/A); this appears to reduce the frequency of the issue.

2. Several people in a workgroup are running the same application from a server.
NOTE: Network connections also can be lost when many people run the same application from a server (for example, 10 clients use the same installation of FileMaker Pro). Windows-based applications generally report segment load failures when the network connection is lost. If network connections are lost or dropped, the system or application may stop responding(hang), or the network installation of Windows for Workgroups may become corrupted.

If you lose your Windows for Workgroups connections, immediately save all open data files to backup files on your local drive or a remote Drive where you still have a valid connection.

Why it happens?

Loss of network connections can occur when you use any version of the redirector, but the basic redirector, invoked by using the "NET START BASIC" command, is most likely to have this issue. The issue seems to be caused by a timing issue in the NetBEUI protocol. It may also be related to the network buffer size because it occurs when data is being sent over the wire.

Other factors that can cause connection issues include the following:
- Network cards: Some network cards are more prone to these issues than others.
- Machine speed: The slower the machine, the more likely that its network connections may be lost.
This issue usually originates with the server but affects clients only.

Troubleshooting

The following steps may help prevent this issue:
- Increase FILES= to 128 or higher in the CONFIG.SYS file.
- Increase FCBS= to 25 or higher in the CONFIG.SYS file.
- Increase Sessions= to 32 or higher in the PROTOCOL.INI file.
- Set NCBS= to 64 in the PROTOCOL.INI file.
- Set NetHeapSize= to 52 in the [386Enh] section of the SYSTEM.INI file.
- Set TimerCriticalSection= to 10000 or higher in the [386Enh] section of the SYSTEM.INI file.
- If you are using a network installation of Windows (Setup /N) set maintainserverlist= to NO in the [network] section of the SYSTEM.INI file.

LaserWriter 2.0 ROM: Changes to Data Rates for Serial I/O

This article has been archived and is no longer updated by Apple.

In general, the information here supersedes corresponding material in Appendix D of the PostScript Language Reference Manual (copyright 1985, Adobe Systems Inc., Addison-Wesley Publishing Co., ISBN 0-201-10179-3); you should refer there for further information.

The LaserWriter's serial communication capability has been enhanced. The maximum baud rate has been increased from 9600 to 57600 bits per second.

While the default mode of operation of the LaserWriter's serial I/O remains the same as the original LaserWriter, the new capabilities must be explicitly enabled if desired. This is accomplished by executing 'setsccbatch' or 'setsccinteractive' operators as described in the PostScript Language Reference Manual.

The baud operand of 'setsccbatch' or 'setsccinteractive' may now be any positive integer less than 100000. The hardware can acheive only certain baud rates; other values will be rounded to the nearest achievable one. Above 9600 baud, the achievable rates are:

10473, 11520, 12800, 14400, 16457, 19200, 23040, 28800, 38400, and 57600.

Of these,19200 is the most likely to be supported by the host operating systems.

Using Word Services In ClarisWorks 3.0

How to access Word Services in ClarisWorks 3.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Word Services is an undocumented feature that allows you to take advantage of the System 7 Word Services feature. If a dictionary product supports System 7 Word Services then you can use it to spell check a ClarisWorks document (instead of the standard dictionary that ships with ClarisWorks).

This feature can be accessed by holding down the Option key and choosing Writing Tools from the Edit menu. The Word Services command will appear at the bottom of the Writing Tools sub menu. This will allow you to use additional dictionaries that support the Word Services feature incorporated in System 7.0, 7.1 or later versions of system software.

Claris tested the functionality of this feature with the Spells Well dictionary.

Importing Desk Gallery Images and Using the Kudo Image Browser

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Desk Gallery is a collection of 30,000 clip art images for use with products such as ClarisWorks. It includes a product called the Kudo Image Browser. In order to use some of the images in this collection, the Kudo Image Browser must be properly installed because it updates the XTND TIFF file translator. Some of their graphics are in the TIFF file format and are compressed using LZW compression. These files need this updated translator in order to be imported.

They have also found that some of their images are too large to import into a ClarisWorks paint document, regardless of how much memory is allocated to the application. These images can be successfully inserted into a word processing document, however.

It is also recommended that the memory allocation for any application be increased to accommodate these sometimes large and complex graphics.

Banyan Vines File Service Commands

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The following are a few of the File Service commands that can be used on a DOS workstation attached to a Banyan VINES file server:

PCCOPY: Copies vines system files to a workstation diskette of fixed disk. Vines system file include PC Configuration software and/or LAN drivers, LAN Driver diagnostic, and Redirector.
Syntax: PCCOPY.

SET ATTRB: Displays or changes attributes of one or more files or directories.
Syntax: SETATTRB [+/- attribute] [DOS filename] [/view:file-system] [/show]
attributes: ro: read only, nd: no delete, hi: hidden, sy: system, ar: archive, eo:execute only, sh: sharing, nr: no rename.
example: setattr +ro +nr contact.fm

SETDRIVE: Assigns network drives to network file volumes and maps a drive to a specific path.
Syntax: SETDRIVE [d: service-name] [/root:dir1\\dir2\\dirn] [d /x] [/L] [/status]
d: drive, root: map specific pathname as the root directory, x: delete mapping, L: list the current drives,
example: setdrive f: Òfs_apps@fmpro@sqaÓ /r:\\fmpro.

VCOPY: Copies files and directories with associated Macintosh long file names, resource forks and desktop information.

Syntax: VCOPY [source pathname] [destination pathname] [/a][/e][/o][/p][/s]
a: copies access rights, e: copies all empty directories, o: to overwrite existing objects without prompting, p: prompts with a source file name, s: copies all sub-directories.
example: vcopy *.exe a:\\ /a

VDIR: List the name of directories and files in a directory, including short names (DOS) and long names (Mac).
Syntax: VDIR [dos pathname] [/view: file-system] [size] [/time:ttype] [/pause][/menu]
example: vdir g: /v: m.

VRENAME: Rename files and directories.
Syntax: vrename [dos pathname] [new name] [/view: file system]
example: VRENAME \\hwood product /view:m

Note: For a more detailed explanation of these command refer to VINES Command Reference.

ClarisWorks: Controlling Startup Options

How to control the Welcome Screen and Startup Options.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

When starting up ClarisWorks 3.0 for the first time, you will see a "Welcome Screen" which offers you three choices:

- Show me an on screen tour of ClarisWorks
- Create a new document
- Open an existing document

There is also a checkbox at the bottom of the screen which offers you the option to bypass the Welcome screen in the future, and go directly to creating new documents at startup.

On a Windows computer
If you have checked the box to suppress the Welcome screen and decide later that you would like to restore it, you can do this by deleting the CLWORKS.PRF file.

1. Save any open ClarisWorks files and exit the application.

2. Use the Windows FileManager or DOS to locate the CLARIS directory. If you used the default settings when installing ClarisWorks (or if ClarisWorks came pre-installed on your computer), the CLARIS directory will be located inside your Windows directory.

3. Delete the CLWORKS.PRF file located within the CLARIS directory. [NOTE: This will undo any changes you have made to the default application preferences.]

4. Restart ClarisWorks to see the Welcome screen.

On a Macintosh computer
ClarisWorks 3.0 for Macintosh has several startup options. To restore the Welcome screen, or to choose whether to have ClarisWorks create new documents, open existing documents, or do nothing at startup:

1. Choose Preferences under the Edit menu.

2. Select the General category on the left side of the dialog box.

3. Under the options for "On startup, show" (in the lower-right corner) choose the desired option.

4. Click on the Make Default button and then on the OK button.

5. Quit and restart ClarisWorks to see the new startup setting.

Creating a Column of Times Incrementing by 5 Minutes Per Cell (SS)

Here are step by step instructions for a method to create a spreadsheet where the first column will contain times that will appear in 5 minute increments beginning at 8:00 AM.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
To create the column of times, follow the steps below in a Spread Sheet document:

1) Click on your column heading to select the whole column.

2) From the Format menu select Number and click on the time format that you want to display.

3) In the first cell of the column type in "=TIME(8,0,0)" (This will set the time to 8:00 AM)

4) In the next cell down* type "=A1+TEXTTOTIME(0.5)" *Note that A1 is the cell that was used as the first cell in the time column.

5) Now click into the second cell (A2) and drag your mouse down as far as you need to accommodate all of your times.

6) From the Calculate menu select Fill Down.

Now you have times beginning at 8:00 AM and incrementing five minutes in each cell.

ClarisWorks: Recording a Macro to Insert the Current Date

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Currently there is no feature for inserting the current date into a spreadsheet. It is, however, quite easy to create a Macro to accomplish this task (if you don't want to just type it in).

Use the following steps:

1) Select Record Macro from the File menu under Shortcuts

2) Click on Record in the Record Macro dialog (If you wish to use this Macro again give it a name, such as Today's Date)

3) Click into the cell you wish the date to appear in and type:

=NOW()

4) Hit enter on your keyboard (NOT return)

5) Choose Copy from the Edit menu

6) Choose Paste Special From the Edit menu, check box for "values only"

7) Choose Number from the Format menu and select the date formatting you wish to have appear

8) Select Stop Recording from the File menu under Shortcuts

You will now see today's date showing in that cell. If you have selected a formatting that spells out the month name, you may get ######## in your cell. If you do simply widen your column to see the date.

If you wish for this date to be placed in another cell of the spreadsheet, click into the field you want it to appear in and the select Play Macro from the File menu under shortcuts, and select the name of the macro you just created, it will place the current date in whichever cell you run the macro from, and it will appear in the format you chose when you recorded the macro.

NOTE: After choosing Record Macro, do not choose a different cell to work with of Claris Works will record that movement in the Macro.

ClarisWorks: Global Village Teleport Gold II Modem Setup

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The following information has been acquired from Global Village Technical Support. For further information please contact Global Village.

When using the Teleport Gold II or Teleport Gold II fax modem on a Performa , try the following setup with ClarisWorks Macintosh:

1- If using the Apple Modem Tool, set the setup (initialization) string to AT&F1
Set the handshaking to "CTS only"

2- Alternatively, try using the serial tool. When doing this, you can set the handshaking to CTS only, but you'll have to enter the initialization string and phone number as an AT command.

Poor Performance when Choosing ‘Open‘, Save, or ‘Save As‘

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

ISSUE

When selecting Open, Save, or Save As the dialog box takes longer than normally expected to appear.

EXPLANATION

When you have installed the DataViz MacLink translators, MacLink does not save a list of available translators and their locations. Therefore, each time a command is received to use the MacLink Plus Bridge, a list is built on the fly.

SOLUTION

If you remove the MacLinkPlus Bridge from the Claris Translator folder, you may notice an increase in the opening of these dialog boxes.

ClarisWorks: Sorting the Rows of a Word Processing Document

A step-by-step guide of how to use a spreadsheet to sort rows or a word processing document.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

While there is no Sort command built into the word processing environment of ClarisWorks, it is easy to use a temporary spreadsheet document to sort the lines and return them to the word processing document.

NOTES: Before using this or any technique where you are replacing your work, save a copy of your original document.

Limitations of this technique: This procedure actually sorts paragraphs. Each row, or item to be sorted must be followed by a return.

You can have no more than 255 characters in any paragraph. Characters after the 255th will be truncated (cut off!) when you paste to the spreadsheet.

You will lose the font and any formatting of the text (bold, italic, etc,) and will have to reset it for the text that you sort.

To sort the lines of a word processing document:

1) Highlight the rows you wish to sort.

2) Go under the Edit menu and select Copy (command-C).

3) Go under the File menu to New. Make a new Spreadsheet document.

4) Go under the Edit menu and select Paste (command-V).
The text will paste beginning at the first cell, and it will remain selected. It is important that you do not click anywhere on the spreadsheet document, as this will deselect the text.

5) Go under the Calculation menu to sort (command-J).
Do not change any of the defaults unless you wish to change the way it sorts. If you wish it sort in descending order (c-b-a instead of a-b-c), click the descending icon for the first sort key.

6) Hit OK.
The text will still be selected. Check to make sure that the text is now sorted.

7) Make sure the text is selected. Go under the Edit menu to Copy.

8) Close the spreadsheet document. You do not need to save it.

9) Returning to the word processing document, the original text should still be selected. Go under the Edit menu to Paste.
The original text will be replaced by the sorted text.

10) Make any font or format changes you wish.

Calculation Results Incorrect by a Very Small Amount

Issues encountered when using the Round Function when the utility application, MacTools TrashBack, is also installed.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

MacTools Trashback, a utility included with MacTools Pro 4.0, has been reported to affect calculations in FileMaker Pro and ClarisWorks. For example, the formula =0 returns a zero. The formula =ROUND(0,2) should also give a result of zero. With MacTools Trashback installed, this calculation produces .010000000000001.

MacTools Development is aware of the issue and has reportedly fixed it in the latest version.

Can‘t Open Document Stored on Novell Server

"File is locked" error message when opening a file from a read only volume

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
ClarisDraw 1.0v2 documents stored in a read-only volume on a Novell server cannot be opened.

When you attempt to open the document, you'll get an error message, indicating that the "File is locked." Changing the access privileges to allow write access will allow the document to be opened. There is no other workaround.

ClarisWorks and ClarisImpact files may be similarly affected.

This issue does not occur on an AppleShare server.
Published Date: Feb 18, 2012

Opening MacDraw II or ClarisCAD Libraries

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
You can open your MacDraw II or Claris CAD libraries with the ClarisDraw 1.0 application.

1. First, if you are working with Claris CAD, you must save your drawing as a MacDraw II file.
2. Launch ClarisDraw.
3. From the File menu, choose Open....
4. Select the MacDraw II file that contains the library.
5. Click Yes to save the file and name converted the library.

If you want to open the MacDraw II drawing as a regular ClarisDraw file, not as a library, then open a new ClarisDraw file, then use Place File... (under the File menu) to insert the MacDraw II drawing into your ClarisDraw document.

Converting MacWrite II Document With Inserted Variable Dates

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When converting a MacWrite II document that has a date variable inserted, regardless of the the preference setting of the MacWrite II document, the date will update with the current date that is on the system.

The MacWrite II translator seems to ignore the preference setting for "Never Update" embedded in the MacWrite II document.

This is is an issue if you wish to refer back to the date. The only work around at this time is to open the document in MacWrite II and copy it then paste it into ClarisWorks.

ClarisWorks: Text not printing to LaserJet Printer

What to do if your text is not printing from ClarisWorks for Windows using an HP LaserJet printer.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

If you are trying to print a document from ClarisWorks for Windows to a Hewlett-Packard LaserJet printer, and you do not get a printout, the issue may be related to your printer driver or the text fill. If you are using the Universal 3.1.4 Printer driver, or you are using colored text that is a light shade (50% fill), your text will not print. To fix this, use the latest Hewlett-Packard driver, or choose a darker color for the text.

For more information about where to obtain the latest printer drivers, you can contact Hewlett-Packard.

ClarisWorks: Using the Macro Wait Command When Recording Communications Macros

Tips for using the Macro Wait command, and reasons why it may be unreliable

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The use of the Macro Wait command when recording Macros for Communication documents can in some cases be unreliable. If you are having problems using this command it may be due to one of the following:

- The Macro Wait command may only be issued once per Macro. Using the command two or more times in a single macro may cause it to not work at all.

- Its operation is not consistent among the various versions of ClarisWorks

- The command must be issued and the Macro must be in the wait state BEFORE the host sends the string that the Macro Wait command is waiting for.

- The command "sees" invisible characters and may appear not to recognize the desired text, when in fact, the text contains characters that are not visible.

- The wait string is not editable. If the string is not correct, the entire Macro must be rerecorded.

Due to these limitations, it is recommended that the use Macro Wait command NOT be generally attempted. Its use should be reserved for those who have an in-depth understanding of communications, understand its limitations, and who are willing to experiment.

An alternative is to check the "Play Pauses" box when recording Macros for communications. While slower, this is a significantly more reliable and productive way to record Macros for communications. The following steps are recommended as a consistently productive method of recording Macros for communications.

- Run through the procedure you wish to record manually, without recording, preferably several times, so that you see and understand all the messages, paths and options that may occur during the sequence.

- Take out a sheet of paper and divide it into two halves with a line down the middle. Use the left side to write down what you enter when you are responding to the host. Use the right side to list the messages sent by the host. In doing this you are creating a script.

- When you are sure the script is correct, Start recording the Macro with "Play Pauses" checked and follow the script exactly as quickly as you can. Then stop recording.

You now have a Macro that should work efficiently, correctly and reliably.

ClarisWorks: Edit Menu Commands Affected by Moire Screen Saver

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you are running the Moire Screen Saver,you may encounter an incompatibility issue when the screen saver engages. While entering records in a ClarisWorks Database, if the Moire screen saver engages, the Edit Menu commands sometimes change to what they would be in Layout mode. While in this situation, the keyboard commands for "Layout" or "Browse" do not work. They must be selected from the Menu. Choosing Layout and then Browse from the Layout menu usually returns the proper Browse Edit Menu, but sometimes the file must be Closed and reopened to access the "New Record" command. This issue most often occurs after a short pause ,a minute or so, when entering data. Allowing or forcing the "Moire" screen saver to engage always produces the issue.

The solution is to remove Moire from the control panels folder.

CLarisWorks: Troubleshooting Reference in Manual‘s Index is Incorrect

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

The ClarisWorks 3.0 User's Guide (part number U02600-012B) Index refers to the Electronic Help for information about Troubleshooting. It states to look in Topics A-Z. The Troubleshooting is actually found in the Electronic Help under the section called ClarisWorks Help Contents. The keyword list also has an entry for "troubleshooting".

ClarisWorks: About Version 3.0v2 for Windows, Release Notes (Fixes)

Fixes implemented in the 3.0v2 update

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The 3.0v2 update to ClarisWorks for Windows 3.0 remedies many problems that you may have been experiencing. This revision addresses the following:

Performance
- Faster launching (up to 30% faster) for CPUs with 4 MB of RAM
- Faster typing and tabbing speed in the database

Display
- Cursor is now visible on CPUs with the Cirrus Logic video cards
- Documents imported from ClarisWorks 1.0 now display fonts accurately
- Line spacing in documents no longer change when you reopen a document

Import/Export Filters
- Fixes Word for Windows 2.0, WordPerfect 6.x, DBF and WKS filters
For WordPerfect 6.2 files, corrects certain types of international character and margin errors.
--For Word for Windows 2.0, can now import documents with hanging indents.
For .DBF files, imports without omitting any data.
For .WKS files, dates are imported correctly.

Spelling and Hyphenation
- Hyphenates more accurately
- Spelling dictionary no longer flags repeated words

Miscellaneous
- Now works properly with Hewlett Packard DeskJet 5.0 driver, when it is set as the default printer
- Monotype fonts are now installed properly
- A Program Icon for the Introduction to ClarisWorks is now added. On 4 MB CPUs, we recommend that you run the tour from the Program Manager and not from within ClarisWorks. To run the tour, double-click the icon.

In general, if you have a computer with 4MB of RAM, you may still face occasional out of memory messages because most of the memory is required to run your operating system and little is left for ClarisWorks. To optimize your system, please follow these steps:

1.Turn on Virtual Memory and make sure it is set to Permanent.
2.Ensure that Virtual Memory is set at 11,700 or higher.
3.Turn on 32-bit Disk Access (this step is NOT recommended for laptops running on battery power).
4.Defragment your hard disk using a third party utility or the utility provided with DOS 6.x.

Consult the READ ME file (General Troubleshooting section) for full details on optimizing your memory.

Creating a Macro to Paste From Last Record

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
FileMaker Pro and AppleWorks can both Paste from the Last Record making data entry much easier. ClarisWorks does not have a feature for accomplishing this task but a Macro can be made to simulate this feature. In fact, this Macro is exceptionally fast with very little screen interruption. Here are the steps:

1. Open your database and create a new record.
2. Put your cursor into any blank field on that new record.
3. Choose Record Macro from the Shortcut submenu under the File menu.
4. Hold down the Command and Shift keys and type the Return key once (this moves you to the previous record).
5. Choose Select All from the Edit menu.
6. Choose Copy from the Edit menu.
7. Hold down the Command key and type the Return key once.
8. Choose Stop Recording from the Shortcut submenu under the File menu (this moves you to the next record).

Make sure to assign a keyboard equivalent to the Macro so it is easy to initiate.

NetWare Workstation Drivers and Windows

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Problems running FileMaker Pro with Novell NetWare are often attributed to the incorrect installation of workstation drivers. If all of the drivers that work together are not updated together, you may get a network connection but not necessarily all of the support needed for record locking, file locking or transmission of(broadcasting) a hosted FileMaker Pro file.

FileMaker Pro works with all versions of the updated drivers provided they are ALL updated together. When Novell makes an update available, there are many files included. All of the files used in the system should be updated at the same time. The README files included with each update explain this in more detail.

FileMaker requires IPX/SPX v3.10 and Netx v3.26 or above. However, more recent drivers are available.

In the past, the Workstation drivers were updated in files on the Novell forum of CompuServe called NetWire. They were called DOSUPX.EXE and WINUPX.EXE. These files will soon be removed from NetWire if they aren't already.

The new naming convention for updates is VLMUPX.EXE, NET33X.EXE, and WINDRX.EXE (where X represents the update level).

The contents of these files are outlined below.

NET33X.EXE contains the following files:

```
NETX.EXE            78749     05-24-94       8:53a
EMSNETX.EXE         90605     05-24-94       8:55a
XMSNETX.EXE         87273     05-24-94       8:57a
\\NETXWIN\\
NETWARE.DRV        126256     02-23-94       9:53a
NETWARE.HLP         34348     02-12-92       3:12p
```

The Net33x.exe file includes the NetWare driver set v2.02 for workstations using NETX and Windows 3.0 or 3.1. Note: DO NOT MIX THESE FILES ON WORKSTATIONS USING THE NETWARE DOS REQUESTER (VLMs). No further development is being made on: NETX.EXE, EMSNETX.EXE and XMSNETX.EXE. The latest updates and future development to workstation drivers will be to the VLM drivers. To get the latest info on the client requester download VLMUPx.EXE , (where x stands for the latest rev).

WINDR1.EXE contains the following files:

```
NWPOPUP.EXE       4,592      10-28-93       8:06a

\\VLMDRVS\\
1252_UNI.001        727      05-31-94      12:39p

ClarisWorks: How To Create Legal / Pleading Paper

A step-by-step technique that allows you to create pleading paper

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
To create a document that has the numbers 1-28 on the left, followed by a vertical line, etc -- pleading paper, follow the instructions below:

1) Decrease the Left Margin setting by half an inch by selecting Document from the Format menu .
2) Set the Sailboat (left indent marker) half an inch to the right.
3) In the gutter now created, Option drag (Windows - ALT + drag) out a text frame and type in numbers from 1 to 28.
(use more or less numbers and extend frame for additional pages as needed)
4) Choose Select All from the Edit Menu
5) Select Paragraph... from the Format menu and set the Line Spacing to Points.
6) Fine tune the spacing between numbers to match typical text by clicking on the Increase or Decrease Spacing Controls in the lower center of the Ruler.
7) Select Show Tools (if they're not showing) from the View menu, and draw a vertical line to the right of your numbers.
8) Finally for repeated use, Save the file as a Stationery document.

ClarisWorks: Hanging During Installation, Hanging After Launching Application, or Difficulties Launching

An incompatibility could arise between certain versions of S3 based video drivers and ClarisWorks for Windows 3.0.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Some common symptoms of this incompatibility are:

- Installation hanging on ClarisWorks diskette #2. This usually occurs right after choosing what type of installation to perform (Full, Minimum, or Custom.) The install program will then appear to continue by redrawing portions of the screen with colored rectangles (white and blue) but eventually hang.

- Double clicking on the ClarisWorks application icon from Program Manager or trying to launch ClarisWorks from the File Manager. In the case of the Program Manager, double clicking on the icon doesn't do anything. Launching from the File Manager will bring up the ClarisWorks splash screen but the system will hang there.

SOLUTIONS:
- Try excluding the range of memory for the video card. Most high end accelerator cards normally take up the memory range from A000-C7FF (these are zeros and not the letter 'O'). Typically an memory manager exclude statement looks something like this.

device=c:\\dos\\emm386.exe noems x=A000-C7FF

- Try switching to the Windows VGA driver. If this works, contact the manufacturer of your video card and see if an updated driver is available for your card.

This issue has been encountered when using the following drivers...
- S3 2.21 800x600 256 color SF (small font)
- Stealth 24 (version unknown)

ClarisWorks: Changing Location of Claris Directory During Installation

What to do if the ClarisWorks installer does not allow you to change the location of the CLARIS directory

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Changing Location of Claris Directory when installing ClarisWorks 3.0 If the option for changing the location of the CLARIS directory during installation of ClarisWorks 3.0 is either not available or is grayed out, it is possible that the installer is detecting another copy of ClarisWorks on the system. A typical scenario might be a network administrator setting up ClarisWorks to run off of a network server or drive.

If a previous version of ClarisWorks (or other Claris application) has been installed on the machine where the network installation is taking place, the install program will detect the presence of the existing CLARIS directory and not allow you to change it's location. The workaround to this is to delete or move your CLARIS directory so that the install program doesn't detect it.

After doing this, the install program will add a "Claris Directory" option to the bottom of the custom install dialog box which will allow you to specify another location for the CLARIS directory.

Faster Mode Not Available on ImageWriter

Faster mode printing is not available in Claris Organizer 1.0v2 on an ImageWriter.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
When printing to an ImageWriter I or ImageWriter II with Claris Organizer 1.0v2, the "Faster" mode is not available. It was available in version 1.0v1.

There is currently no workaround for this issue as disks for 1.0v1 are no longer available as replacements.

ClarisWorks: Partial Screen Display During Installation

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
A Windows utility called WinProbe may interfere with the installation of ClarisWorks 3.0v2. WinProbe is a utility that displays detailed information about the computer's system configuration. Having WinProbe installed on your system may cause the ClarisWorks Installation to display partial screens, making the program impossible to install.

To remedy the issue, you want to remove the Resource Optimizer component of WinProbe from your Win.INI file so it will not interfere with the ClarisWorks installer.

To make these edits do the following:

1) From the Program Manager choose Run from the File menu
2) In the Run dialog in the command line type: sysedit
3) Click OK (this will bring up your system configuration editor)
4) Click on the tile bar of the window that says- C:\\WINDOWS\\WIN.INI
5) Locate the line that says LOAD=
6) Delete "optmod.exe" from this line (this can be added back after ClarisWorks is installed)
7) Choose Save from the File menu and then Exit
8) Make sure all your applications are closed in Windows and then exit Windows.
9) Restart Windows and run the ClarisWorks installation again.

Note: This issue does not occur with ClarisWorks 3.0v1.

ClarisWorks: WordPerfect 2.x Translator Issue

Issues using the WordPerfect translator with ClarisWorks 3.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
There are issues related to the WordPerfect 2.x translator and accented characters. They are translated as underlined spaces "_" in WordPerfect 2.1 Macintosh. This occurs in BOTH directions, between ClarisWorks 3.0 and WordPerfect.

Work around:
Save the document as Microsoft Word format or any other format that WordPerfect supports.
Published Date: Feb 18, 2012

File Size does not Decrease when Contacts are Deleted.

What happens to Claris Organizer files sizes when contacts are deleted?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Question:
What happens to the file size when contacts are deleted?

Answer number one:
It is normal for Claris Organizer to fluctuate file size a little bit, even when deleting. The space freed up by the deleted contacts will be reused the next time you save after modifying the file, and space at the end of your file will be truncated. This system is set up so that you never corrupt your data in the event of a system crash or power failure while saving a file. Also, by reusing space in the existing file, saves are faster than having to recopy the entire file every time.

The more technical answer:
When contacts are deleted, each of the blocks containing one of these contacts is marked as a modified block. On a save, all modified blocks must be rewritten to the data file before the old blocks in the file are deleted. This is so that if a crash occurs in the middle of the save operation, the existing data is not corrupted. The next time a save occurs, however, the old block images are reused based on a best fit algorithm. This system makes saving time faster because we do not need to rewrite the entire file every time you save: only the modified blocks. The end of file marker is truncated whenever possible.

Display Card 8/24GC: Using with Sony Monitors

I want to use the Sony MultiScan CPD-1304 monitor with the new Display Card 8/24GC. Will this work?

This article has been archived and is no longer updated by Apple.
If the CPD-1304 monitor works with the Macintosh High-Resolution Video Card (the current 8-bit display card), there won't be any problem with the Display Card 8/24GC signals driving the Sony CPD-1304. (We could not verify that the CPD-1304 monitor works with the Macintosh High-Resolution Video Card, but we do know that Sony's CPD-1302 monitor works with that card.) However, you will need to use a different cable to connect the two devices because the cards have different connectors.

An issue with regard to the cable concerns the sense pins, which tell the card what type of monitor is attached. For the Sony CPD-1302 monitor, the sense pins should be configured as below, where 0 = Ground and 1 = Not Ground. To ground a sense pin, tie it to the C&VSYNC.GND signal.

Sense pins			Hor x Vert Dot	Vert
10	7	4	Display Pixels	Clock Refresh
1	1	0	12" Monochrome Monitor 640 x 480	30.24 66.7
			13" Color Monitor	

Here are the pinouts for the Macintosh Display Card 8/24GC:

Pin	Signal	Description
1	RED.GND	Red Video Ground
2	RED.VID	Red Video
3	CYSNC~	Composite Sync
4	MON.ID1	Monitor ID, Bit 1 (also known as SENSE0)
5	GRN.VID	Green Video
6	GRN.GND	Green Video Ground
7	MON.ID2	Monitor ID, Bit 2 (also known as SENSE1)
8	nc	(no connection)
9	BLU.VID	Blue Video
10	MON.ID3	Monitor ID, Bit 3 (also known as SENSE2)
11	C&VSYNC.GND	CSYNC & VSYNC Ground
12	VSYNC~	Vertical Sync
13	BLU.GND	Blue Video Ground
14	HSYNC.GND	HSYNC Ground
15	HSYNC~	Horizontal Sync
Shell	CHASSIS.GND	Chassis Ground

ClarisWorks 3.0: Datasheet

ClarisWorks - The all-in-one answer for business, home and education

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

What makes ClarisWorks software your best all-in-one answer for business, home and education? First, it does everything you do-easily. Like letters, memos, reports, budgets, presentations, proposals, flyers, mailing labels, contact lists, newsletters-and virtually anything else.

Second, the word processing, spreadsheet, database and graphics functions in ClarisWorks are completely integrated-so you learn just one program, not half a dozen separate ones. You'll also appreciate the way it works-from its consistent menus to the effortless way you combine words, graphics, tables, images and even video on a single page.

Third, ClarisWorks steps in to help get your documents done fast. ClarisWorks Assistants guide you through complex tasks and even provide expert advice on document layout and design. And 150 push-button Shortcuts reduce common operations to a single click.

And then there's its extraordinary lean, compact design. Built for lightning fast speed, ClarisWorks conserves precious disk space and battery life-perfect for laptops.

Features and Benefits

One Powerful Application for All Your Documents

- All-in-one Integration - Access word processing, outlining, spreadsheet, charting, presentation, graphics, and paint tools all on a single page.
- Shortcuts - Speed through your work with instant push-button access to 150 of the most common operations.
- WYSIWYG Display - Always "What You See Is What You Get"-from the screen to the printed page. View and edit documents while you work; no separate modes or windows needed to preview headers, footers, or footnotes.
- Share Files - Open either Macintosh or Windows ClarisWorks documents instantly- without translation. Easily share files with popular Macintosh, Microsoft Windows, and DOS programs.
- Slide Show Presentations - Create and deliver professional slide show presentations on screen with master background and movies.
- Fonts and Clip Art - Produce attention-grabbing documents by using seven bundled fonts and 75 clip art images.
- Ultra-compact and Speedy - Minimal disk and memory requirements make ClarisWorks perfect for even modestly configured and notebook computers.
- Communications - Use integrated communications environment for Macintosh or Windows Terminal Accessory support to connect with online services or the Internet.

Complete Word Processing for Professional-looking Results

- Versatile Formatting - Customize tabs, margins, indents, line spacing, automatic hyphenation, and justification. Use type faces, styles, sizes, headers, and footers for the appropriate look.
- Multiple Columns - Size columns on screen to fit your exact needs-with full access to rulers and tabs. Even create different size columns on the same page.
- Text Wrap - Flow text automatically around any graphic or chart on the page for a sharp, polished look.
- Writing Tools - Access all the information you need to write correctly with 110,000 word spell checker, 660,000 word thesaurus, and word counter.
- Outlining - Organize documents quickly with six predefined outline styles, or create your own.
- Mail-merge with Database - Personalize form letters and mailings directly from your database.
- Automatic Footnotes - Create perfect footnotes. The Footnote Assistant prompts you for needed information and formats footnotes perfectly.

Spreadsheet and Charting Tools Bring Numbers to Life

- 100 Built-in Functions - Analyze your data using the built-in mathematical, statistical, financial, date, time, logic, and text functions.
- Dazzling Charts - Communicate information more effectively using 12 chart types, including bar, pie, line and hi-low close charts. Change fonts and adjust orientation, size, colors, patterns, 3D effects, and more to illustrate your point.
- Instant Tables - Use the Table Assistant to create a table in any ClarisWorks document, formatted to your exact specifications.
- Spreadsheets - Add spreadsheets of any size to your documents on command and position them exactly where you want them.

Colorful Graphics Highlight Your Message

- Comprehensive Graphics Tools
- Create graphics instantly with tools for lines, rectangles, ovals, and more.
- Select from 100 fill patterns and up to 256 colors.
- Smooth and reshape curves and shapes with the bezigon tool for precise graphics.

- Gradient Fills - Add pizzazz to your documents, using 16 black & white or 16 color gradient patterns.
- Full Color Painting - Edit scanned images and add vibrant color effects with special paintbrush, paint bucket, and spray can tools.

Database to Easily Access and Manage Your Data

- Versatile Search and Sort Functions - Select, group, and identify the data you need by specifying search parameters. Quickly organize information with automatic sorting.
- Mailing Labels - Generate labels effortlessly with over 50 predefined Avery formats.
- Visual Reports - Lay out your data on screen exactly the way you want it to appear.
- Automatic Field Entry and Verification - Avoid repetitive data entry and ensure field consistency and accuracy by creating pop-up lists of data.

Get Started Easily and Quickly

- ClarisWorks Assistants - Have expert Assistants quickly step you through design and layout tasks like formatting footnotes, printing envelopes-even creating presentations.
- On-Screen Introductory Tour - Receive a brief introduction to many ClarisWorks capabilities. Get basic instruction so you can get started without reading a single manual.
- Templates - Get started quickly. Claris includes ready-to-go documents that you can use as is or customize to meet specific needs.
- On-screen Help - Receive on-screen answers to your questions without having to refer to the manuals.

ClarisWorks Does It All!

Isn't it about time you had all the tools you need for your everyday projects in one place? Whatever you need to do, ClarisWorks has everything you need to get it done. Word processing. Spreadsheet. Charting. Graphics. Database. Painting. Instead of buying separate applications, ClarisWorks provides it all in one. So you're assured of tools that work together to tackle complicated jobs in record time. And nobody makes it easier or more affordable.

For more information and the location of a Claris reseller near you.

Specifications For Macintosh

File Formats Supported

Word Processing - Acta 3.0, AppleWorks 2.0-3.0, AppleWorks GS, ClarisWorks 1.0-2.1 text, MacWrite®, MacWrite II, MacWrite Pro, MS-Word 3.0, 4.0, 5.1, MS-Word PC, MS-Works 1.0-2.0, MS-Write, WordPerfect 1.0-1.02, WordPerfect 4.2-5.0 PC, WriteNow 1.0-2.2, WriteNow NeXT

Spreadsheet - MS-Works 2.0 SS, MS-Excel 3.0, 4.0, SYLK, DIF, DBF, AppleWorks SS, ASCII Text

Database - MS-Works 2.0 DB, DIF, DBF, SYLK, AppleWorks DB, ASCII Text

Graphics - EPSF, GIF, MacPaint 2.0, PICT, PICT 2, Apple QuickTime Movie, TIFF

Required Equipment

- Any Apple 68000 including Macintosh Plus, Centris, Classic, LC, SE, Performa, PowerBook, II, Quadra or Power Macintosh family computer
- Hard disk drive and 1 MB RAM minimum
- 2 MB RAM required for System 7 and communications environments
- System software 6.0.5 or later, or System 7 or later

Printer Support

- Apple LaserWriter, Personal LaserWriter, and ImageWriter families, and Apple StyleWriter
- Hewlett-Packard LaserJet, DeskWriter, and PaintWriter families
- A wide variety of other Macintosh-compatible, third-party printers

Specifications for Windows

File Formats Supported

Word Processing - DOS Text (*.TXT), Rich Text Format (*.RTF), Microsoft Word for DOS 5.5, Microsoft Word for Windows 2.0, 6.0, WordPerfect for DOS 5.1, WordPerfect for Windows 5.1, 6.0

Spreadsheet - Microsoft Excel 3.0, Lotus 1-2-3 (*.WKS and *.WK3), SYLK (*.SLK), DIF (*.DIF), Text/ASCII (*.TXT)

Database - Borland dBASE (*.DBF), SYLK (*.SLK), DIF (*.DIF), Text/ASCII (*.TXT)

Graphics - Aldus/Windows Metafile (*.WMF) 3.0 or 3.1, Computer Graphics Metafile (*.CGM), Encapsulated Postscript (*.EPS), Macintosh PICT (*.PCT), TIFF (*.TIF), Windows Bitmap 3.1 (*.BMP), Zsoft Paintbrush (*.PCX)

Required Equipment

- PC with 386DX/25 Mhz or higher processor
- Microsoft Windows 3.1 or later; MS DOS 5.0 or later
- One hard disk, one 3.5" floppy disk
- 4 MB RAM (8 MB recommended)
- VGA or better video
- Mouse

Printer Support

- PostScript printer such as Apple LaserWriter and IBM LaserPrinters
- Hewlett-Packard LaserJet, PaintJet and DeskJet Series
- A wide variety of other Windows-compatible printers

Read Me File does not Read Properly in Simple Text 1.0

The Read Me file for Claris Organizer 1.0v2 must be read in TeachText or SimpleText 1.2.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The graphics in the Read Me file that comes with Claris Organizer 1.0v2 do not align correctly with SimpleText 1.0.

To recreate:
1) Open Read Me file in SimpleText 1.0.
2) Scroll down to end of file.

The last graphic and the next to last graphic are off center or missing.

Workaround:
Use TeachText or a later version of SimpleText like 1.2.

ClarisWorks 3.0 for Windows: About Version Trial Software, Read Me (Online version)

These instructions are included as a Read Me file in the ClarisWorks 3.0 Trial Software package available on Claris Online Forums.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Thank you for downloading the ClarisWorks 3.0 Trial Software!

***** MINIMUM REQUIREMENTS *****
PC with 386 or higher processor (486 Recommended)
Microsoft Windows 3.1 or Later; MS-DOS 5.0 or Later
Hard disk Drive and 4MB RAM (8MB Recommended)
One 3.5" floppy disk
VGA or better video
Mouse

***** INSTALLATION *****

In order to install the trial software, follow these steps:

1. Change directory to your root directory by typing:

CD\\

2. Create a temporary directory off of your root directory by typing:

MD TEMP

3. Copy both of the downloaded files, CLW3DEM1.EXE and CLW3DEM2.EXE into the same directory using the copy command. Example:

COPY CLW3DEM*.EXE C:\\TEMP

4. Type INSTALL

After the installation has been completed, you may delete the TEMP directory from your system, along with the files contained within it.

The installer will require approx. 6 megabytes of free hard disk space to run and install the software. The actual trial takes up 3 megabytes of hard disk space.

***** FLOPPY DISK INSTALLATION *****

If you do not have enough free hard disk space, you can install the software from a floppy drive instead of the hard drive, by typing the letter for your 3.5" drive after the install command. Example:

INSTALL A:

You will need two blank High Density (1.44MB) 3.5" diskettes to install the software from floppy diskettes. The trial cannot be installed from 5.25" diskettes. You may use the set of floppy diskettes to install the trial on as many systems as you wish. Just run the SETUP.EXE on the first disk from Windows to begin the setup.

***** REMOVING THE TRIAL *****

If you wish to remove the trial from your system after it has been installed, follow these steps:

1. Remove the following line from the [386Enh] section in the
SYSTEM.INI file:

device=<WINDOWS>\\<SYSTEM>\\win32s\\w32s.386

where <WINDOWS> and <SYSTEM> are where the Windows and System
directories are, respectively.

2. Modify the following line from the [BOOT] section in the
SYSTEM.INI file:

drivers=mmsystem.dll winmm16.dll

to the following (remove winmm16.dll):

drivers=mmsystem.dll

3. Delete the following files from the <WINDOWS>\\<SYSTEM> subdirectory or
from the SYSTEM directory in network installations:

W32SYS.DLL
WIN32S16.DLL
WIN32S.INI

4. Delete all the files in the <WINDOWS>\\<SYSTEM>\\WIN32S subdirectory
or the <SYSTEM>\\WIN32S subdirectory in network installations.
Then delete subdirectory itself.

NOTE: <WINDOWS> refers to the windows installation directory. On a
networked Windows installation, the system directory may be located on a
remote share. If you are only removing Win32s from your machine, then you
do not need to remove the shared files (in <SYSTEM> and <SYSTEM>\\WIN32S).
Before removing these files from the network share, make sure that all
users that use Win32s have removed the references to Win32s from the
SYSTEM.INI file.

5. Delete the CW3TRIAL directory located in your root directory.

If you have any problems with this Trial, you can contact CLARIS Technical
Support at (408) 727-9004 or post a message in the ClarisWorks section of

the CLARIS Windows forum.

Picking Up The Tab

First you type, then you boss your text around.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

The Macintosh was the first desktop computer which could print out what you see on the screen. Older computers would simply display the text, no matter what font (if, indeed you could use more than one font) in a display which looked like a typewriter and had codes for things like centering and boldface. The Macintosh was the first computer to have a display that showed you what the page actually looked like as you were working on a document. This is called WYSIWYG (pronounced, wiz-zee-wig). It stands for what you see is what you get. As wonderful as WYSIWYG is, however, it also has its price.

Printout vs. screen

Since the Mac was invented, printers have become a lot better. The original ImageWriter could print at a resolution of 72 dots per inch. The original Mac screens were 72 dots per inch. That worked fine. Most of the current printers, including the Apple StyleWriter and LaserWriter, print at a much higher resolution. This produces text which looks similar to that which is printed in a magazine or a book. Screens are still usually about 72 dots per inch. That also means that text on the screen no longer exactly matches what the printer can print. It is close, but not exact. However, when text does not appear on a paper printout the way you want it, it may not be solely because screen and printer resolutions do not match. That is where the finer points of word processing come in.

When you type text in a word processor like MacWrite or the ClarisWorks word processing environment, text automatically wraps at the end of a line. You do not have to hit the return key to have your text flow to the next line, unless you want to put text on separate lines. The text you type is automatically contained within the margins. This feature is known as text wrap. Sometimes, you want to bypass text wrap to create special effects in your documents. For example, in the flyer announcement illustrated in Figure 1, you would want specific words on specific lines, with the whole thing centered between the right and left margins of the page.

To center text, you first type each line, hitting return at the place where you want each line to end. Then you select (also known as highlight) the text. Lastly, you have to tell the application to center the text between the right and left margins of the page. To do this, while the text is selected, click on the center alignment tool in the ruler. (See Figures 1 and 2.)

The centering text example above illustrates all the basic things that need to happen when you are formatting your text in a word processing environment. First you type, then you boss your text around.

To get really fancy, you have tabs. Once you get acquainted with these, you can really boss your text around.

Why computers replaced typewriters

To format documents on an old manual typewriter, you would slide the tab markers into place on the machine itself, and each time you typed a carriage return, the little bell would ding, then when you hit the tab key, the carriage would go to that spot where you set the tab marker. On your computer, tabs are a little more powerful. You have four kinds of tab, instead of just one. In fact, without being aware of tabs, you may even be tempted to use multiple spaces to simulate those neat and tidy tabs of the typewriter. The issue with using spaces instead of tabs to align text is that spaces and character sizes are not always uniform for most fonts or typefaces. You will want to stick with tabs to create uniform alignment in your word processing documents.

Tabs vs. spaces

It is important to understand the difference between using tabs and spaces to format documents. On an old manual typewriter, each character takes up the same space. The letter "i" takes up the same space across the page as the letter "w" would. On your computer, through the use of fonts, characters on the screen are more professionally spaced, the way that they would appear in a book or magazine. This is referred to as proportional spacing. This means that letters are automatically spaced on a page in proportion to the particular character. Therefore, an "i" gets less horizontal space than a "w" would. Take a close look at the word shown below and notice that each character gets a different amount of space.

If you used spaces to align text blocks typed in the same typeface, things might look close-to-aligned using spaces on the screen, but when they print, they will be out of alignment. (See Figure 3.) How does this relate to tabs? Well, if you use spaces to format a page, the spaces would not be equal to a particular number of characters. Five spaces does not automatically equal five characters because the characters are different widths. Also, because of variation in font size and style, changing the font may not improve alignment. Therefore, if you want to align something on a page, use tabs or the alignment tools, not spaces typed with the space bar. Tabs are a fixed distance from the margin and the alignment tools format the text as a block, regardless of the font. (See Figure 3a.)

As with most things, there are exceptions to this. Two standard fonts, Courier and Monaco, ship with the Macintosh computer. They are what is known as monospaced fonts. They behave exactly like text produced on a typewriter. Each character is exactly the same width. A space is exactly the same width as one character. Here is the same word we used earlier displayed this time in the Courier font. Notice how each character takes up the same amount of horizontal space.

Because these fonts are monospaced, they tend to look unattractive when printed. However, the advantage to using a monospaced font is that it

lets you use spaces to align your text, because all characters take up the same amount of space. In other words, with a monospaced font, a row of 12 periods measures the same amount of space as 12 capital W's. You cannot get the same result with proportionally spaced fonts, such as Times.

Tabs to the rescue

Tabs can apply to just one line or they can apply to the whole document. Once you learn the basics about tabs, You will never again be tempted to use spaces to format your text in your word processor.

There are four different kinds of tabs available to you in MacWrite Pro and ClarisWorks. These tools are located in the upper left hand corner of your screen. They are the four triangles below the ruler. The tab symbols are shown in Figure 3b.

When setting tabs in ClarisWorks 2.0 or later and MacWrite Pro, you can use the Show Invisibles command to show exactly where the tabs and spaces are placed in a document. Tabs appear as non-printing arrows that point to the right and spaces appear as non-printing dots. To show these invisibles, hold down the Command key and hit the semi-colon. To turn this off, hold down the Command key and type a semi-colon again. The great thing about all of this is that it allows documents to have multiple tab settings within a document, so that you can have a table or a specially formatted section for emphasis in special areas of your document. (See Figures 4 through 7.)

The Left Align Tab

The Left Align tab tool is used to align the left sides of the lines in a text block. The heavy black bar on the triangle is on the left side. By default, each new document opens with Left Tabs preset at half-inch increments (they do not appear on the Ruler Bar). Figure 4 shows an example of text aligning at a tab set to 1.75 inches in MacWrite Pro.

The Center Align Tab

The Center Align tab tool is for centering the block of text you type at the center marked by this tool. Figure 5 shows how text blocks of varying lengths are centered using this tab.

The Right Align Tab

The Right Align tab takes the blocks of text you type and aligns them on their right edges. Figure 6 shows an example of Right tabs in action.

The Align On Tab

The Align On tab is used in conjunction with a character you specify (typically a decimal point). When you use this tab, you can align a block of text you type so that it aligns at a specified character where you placed the tab on the Ruler Bar. This is most often used with listings of currency or numbers with decimal values. Figure 7 shows an example of currency figures that align at a decimal point that corresponds to the Align On tab triangle set at two inches from the left margin.

Setting tabs

Remember, you first have to select the text you want to work with, then choose the tab you want. If you want to apply a custom tab setup to a block of text, highlight the text first, then place the tabs in the ruler. To place the tabs, simply click and drag one of these tab triangles and place it along the Ruler Bar where you want your text to align. If you set the tabs before highlighting a block of text, the computer will think that everything after the tab setting should be set this new way. It would not change the existing parts of the document unless you tell it to do so by highlighting the text first, then setting your tab.

Do not forget that you can update tab positions by highlighting the appropriate text and moving a little triangle tab marker icon along the Ruler Bar.

Getting fancy with tabs

Now that you know more about tabs, there are some fancy things you may want to try with your new tab knowledge.

Create a tab leader

Tab leaders are fill characters between tabs. You have probably seen tab leaders in a table of contents section in a book, where you have a topic, then a page number, with a dotted line between the two. (See Figure 8.) Note: To create a table of contents in a MacWrite Pro document, you can use the Table of Contents feature instead of tabs.

To create a tab leader in either MacWrite Pro or ClarisWorks, follow these steps:

1. In your document, set your tabs using the above techniques. In the example, a Left Tab is used.
2. Select the block of text that contains tabs.
3. Double-click on the tab icon indicated for that block of text. (In Figure 8, the tab is set to seven inches.)
4. In the Tab dialog box that appears, select the fill character. (See Figure 9.) The text that has tabs will now have tab leaders as shown in Figure 8.

The same steps can be used in MacWrite Pro, but the Tab dialog box is different in that you can specify any tab fill character. (See Figure 10.)

Bossing your text around

Formatting your text with tabs, you are on your way to having great looking documents. Simple alignment tasks can be achieved using the four kinds of tabs that are available in MacWrite Pro and ClarisWorks. Have fun bossing your text around!

ClarisDraw 1.0 Datasheet

The versatile new Macintosh drawing standard

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Are you looking for a drawing program versatile and smart enough to speed you through all your different graphics tasks? Introducing ClarisDraw™ software the innovative, new version of MacDraw* that lets you quickly and easily produce everything from simple maps and diagrams to free-form drawings and complex space plans. Its unequaled breadth of drawing, painting and presentation tools makes it easy to create virtually any graphic you can visualize. And thanks to its intuitive design and revolutionary graphics intelligence, you do not have to be a graphics expert to get the great looking results you want.

ClarisDraw makes it easy to master any graphic task, offering all the advanced drawing tools you need to create compelling, professional-quality graphics. But that is just the beginning. You also get a wealth of powerful painting and image editing tools, advanced text handling, and presentation capabilities. And floating palettes give you one-click access to dramatic effects like shadows, embossing, colors, gradients, and fill patterns.

Best of all, ClarisDraw has intelligent features that help you quickly produce sensational, accurate results. Its smart graphics tools eliminate the guesswork of traditional graphics programs automatically maintaining alignment, size and connections between objects. The PointGuide™ and Guideliner™ features ensure precise results. And the drag-and-drop professional library puts thousands of high-resolution pictures, maps and design elements at your fingertips.

ClarisDraw also maximizes your productivity by offering seamless graphics compatibility with industry standard file formats including MacDraw II and MacDraw Pro. And its underlying Claris Graphics Engine allows you to transparently share files with the new ClarisImpact™ software for Macintosh and Windows.

Turn to the versatile new standard for fast, flexible and precise Macintosh graphics.
Breakthrough graphics intelligence and integrated drawing, painting, image editing and presentation tools save you time and effort creating professional-quality signs, maps, diagrams, free-form drawings, brochures, flyers and more.

Create powerful presentations in any format.
Communicate your work clearly with slides, handouts, or overhead transparencies. QuickTime movies and special transition effects even let you create stunning on-screen slide shows that get your points across with impact.

Work smart and ensure accuracy.
Produce complex technical diagrams and space plans quickly and precisely with intelligent drawing tools like SmartAlign and PointGuide. Drag-and-drop SmartSymbol libraries of maps, elements and architectural art guarantee that creating graphics from scratch has never been easier.

Master any graphics task.
Beziers, polygons and other powerful tools let you create even the most elaborate drawing. Add your choice of colors, fills, gradients and shadows for dramatic results.

Produce sophisticated layouts in minutes.
Full color painting, image editing effects and advanced text handling features, including linked frames and text wrap, let you produce dazzling posters, flyers and brochures without the help of a designer.

Powerful New Features Include
- Comprehensive drawing tools, colors, fills, shadows and gradients to handle any drawing task
- Full color painting and dazzling image editing effects to enhance drawings and scanned images
- Built-in presentation capability, including Apple QuickTime support and special transition effects, for eye-catching slide shows
- Advanced text handling, to ensure professional layouts for flyers, posters and more
- Drag-and-drop SmartSymbol™ library feature to speed graphics creation
- PointGuide™ and Guideliner™ features guarantee pinpoint accuracy
- Shapes tool to quickly and easily create arrows, plus signs and other common objects of any size or direction
- SmartAlign™, SmartConnector™ and SmartSize™ features to automatically maintain relative object size, alignment and connections
- Industry-standard file format support that provides seamless graphics exchange with other applications
- Microsoft Windows version available in the future

Features and Benefits

ClarisDraw Has The Versatility to Handle Any Task

Comprehensive Drawing Tools
Create professional-looking graphics with tools for lines, rectangles, ovals, arcs, customizable regular polygons, beziers,

notes, and more.

Floating Palettes
Quickly access 64 customizable fill patterns, 64 gradient fills, 256 colors and your choice of line patterns and widths using palettes you can place anywhere on screen.

SmartSymbol Library
Quickly produce compelling graphics with thousands of professionally-designed, high-resolution maps, figures, form elements and architectural art. Just drag and drop elements onto the page.

Full Color Painting
Produce dazzling 24-bit paint images with millions of colors using paintbrush, bucket, spray can and other tools.

Image Editing Effects
Edit paint objects and scanned images for stunning graphic effects using tint, darkness, blend, distortion, shearing, and perspective.

Text to Curve and Object Binding
Achieve dramatic visual results with text curved or bound to any object you specify.

Presentation Special Effects
Create and deliver eye-catching presentations using transition effects including fades, loops, automatic advance, and background colors.

QuickTime Support
Give your presentations greater impact with QuickTime video and sound clips.

Outlines
Add lists and bullet points to any drawing or presentation with built-in outlining.

Linked Text Frames
Speed the layout of flyers and signs by automatically flowing text across frames placed anywhere on the page.

Text Wrap
Wrap text automatically around any graphic shape to produce posters and brochures that get noticed.

Text Styles
Save frequently-used text styles with font, size, and other settings you specify.

Smart Tools Take the Guesswork Out of Drawing
SmartSymbol Manager
Save time and effort using drag-and-drop objects from the included libraries or those you create. Cloned objects can be automatically updated when you change the original.

Shapes Tool
Instantly place arrows, symbols and other eye-grabbing objects of any size or direction anywhere in your drawing.

SmartSize
Automatically maintain the height and width of all specified objects, and instantly update all objects by resizing just one.

SmartAlign
Automatically maintain alignment and spacing (top, bottom, center, left or right)
of graphic objects and text even as they
are moved.

SmartConnector
Create straight or angled lines that stay permanently connected to objects, even when the objects are moved.

SmartShadows
Add depth to any object by applying customizable shadowing effects.

SmartEmbossing
Add a dazzling embossed effect to objects and text with a click of the mouse.

Precision Ensures the Highest Quality Results

PointGuide and Guideliner

Instantly locate mid-points, end-points and object centers to ensure precision placement of lines and objects.

Direct Object Size Editing
View and edit object dimensions, length and angle of rotation for flawless drawing precision.

Precision at Any Scale
Ensure your drawings match high-resolution printed output exactly with precision zooming, object scaling and rotation, and accuracy of over 2300 dpi.

Flexible Document Configuration
Tackle even the most complex drawings with unlimited layers and document sizes as large as 100" by 100."

Full Compatibility for Seamless Graphics Exchange

Robust Graphics Import/Export
Exchange graphics with other users and programs via industry standard graphics file formats, including EPS, CGM, PICT, MacDraw II, MacDraw Pro, and MacPaint*.

Claris Graphics Engine
Maximize your graphics investment by sharing files directly with ClarisImpact.

Printer Support
- Apple LaserWriter, Personal LaserWriter, and ImageWriter families, and Apple StyleWriter
- Hewlett-Packard LaserJet, DeskWriter, and PaintWriter families
- A wide variety of other Macintosh-compatible, third-party printers

Graphics File Formats Supported
- EPSF
- TIFF
- PICT and PICT2
- CGM
- MacDraw II, MacDraw Pro
- MacPaint
- QuickTime Movie

Also from Claris, ClarisImpact!
From timelines and calendars to flow charts and organizational charts, ClarisImpact™ lets you breeze through the structured business graphics you need to create, update and present most. ClarisImpact the complete business graphics manager.

Required Equipment
- Apple Macintosh Plus, Centris, Classic, LC, SE, Performa, PowerBook, II or Quadra family computer
- Hard disk drive and 2 MB memory
- 4 MB required for Apple System 7 and System 7 Pro
- System software 6.0.7 or later, System 7 or System 7 Pro
- Apple System 7 required for Publish and Subscribe, Apple Balloon Help and other System 7 features

Claris* is a leading worldwide vendor of Macintosh and Windows software. With all Claris applications you get the high-quality support and documentation you deserve.

For more information and the location of a Claris reseller near you.

ClarisImpact 1.0 Datasheet

The complete business graphics manager.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Now there is an entirely new way to create and manage business graphics. In a single intuitive program, ClarisImpact®software seamlessly integrates a broad spectrum of pre-designed business charting and diagraming tools, revolutionary editing capabilities, and full word processing and presentation features. This unique combination makes it easy to create, edit and customize professional-looking organization, data, flow, timeline and table charts in a fraction of the time required with traditional approaches.

Everything You Need to Get the Job Done

- Design dazzling graphics, reports, presentations and drawings without expert assistance.
- Create business charts and graphs automatically with pre-designed chart models for org charts, flow charts, data charts, timelines, calendars, and more.
- Choose from comprehensive, professionally-designed style options to instantly create the look you want.
- Edit Smart graphics and text directly in your final documents so you do not lose detail or resolution.
- Produce finished reports and slide shows with built-in word processing and presentation capabilities.
- Import and export information created in popular graphics, charting and word processing programs.
- Microsoft Windows version available in the future.

No other program makes it so easy to create business graphics. Instead of starting from scratch, you simply select the diagram model you need and enter the information. Then ClarisImpact automatically creates the entire graphic with the pre-designed style of your choice! So now you do not have to be a graphic designer to get great looking graphics.

Editing is fast and efficient, thanks to the intelligence built into every graphic. When you need to move, resize, or change an object, ClarisImpact automatically adjusts the proper alignment, spacing and connections. If you want to change the graphic look of an entire chart or individual chart element, you simply select a new look from a list of pre-defined, customizable style options. And because ClarisImpact includes a full set of drawing tools, you can always manage even the smallest graphic detail.

When it is time to communicate these graphics, only ClarisImpact provides fully integrated word processing and presentation capabilities. So you can edit graphics directly in your final presentation or word processing documents, and save time not having to move graphics and data between multiple applications.

ClarisImpact it is the only program you will ever need to create and communicate high-impact business graphics from start to finish.

Features and Benefits

All-In-One Business Graphics Solution

Automatic Graphic Creation
Instantly create perfectly-aligned and proportioned business graphics using any of 7 basic models available in ClarisImpact.

Complete Charting and Graphics Capabilities
Eliminate the need for multiple business graphics utilities. Each model has the capabilities found in dedicated applications.

Pre-defined Styles
Create your own look or select from an extensive collection of pre-defined styles to give all your business graphics a unified, professional presence.

Organization Chart Model Reflects Your Business Structure

Organization Chart Tools
Enter names, titles and other relevant information to create professional-looking organization charts in seconds.

Fast Reorganization
Reflect changes to your organization by simply adding and deleting boxes, or clicking and dragging from one location to another connections and alignment are automatically updated.

Extensive Format Options
Exercise complete format control, including orientation, distribution and spacing of management, peers, and subordinates.

Timeline and Calendar Models Manage Projects and Time

Standard Timeline Features
Create Gantt charts or timelines to track project start and completion dates, durations, milestones, dependencies, critical paths, etc.

Customizable Timelines
Customize timelines, enhancing bars and milestone markers with color, shades and size options, or with symbols and images.

Timeline Task Reorganization
Simply click and drag to reorganize tasks all data and graphics adjust automatically.

Monthly or Yearly Calendars
Create and combine calendars to show events from personal travel to group meetings.

Unique Calendar Design Options
Produce eye-catching calendars with day and text styles like banners and symbols to show special days.

Outline Model Helps Organize and Present Ideas

Complete Style Selection
Organize ideas with any of 12 outline styles including bullet and check box. Set text style, labels and indents by levels.

Easy Outline Editing Features
Change outline sequence by simply clicking and dragging text.

Data Chart and Table Models Compare Your Data

Multiple Data Chart Types
Access a complete selection of data charts: bar, line, scatter, hi-lo, pie, pictograms, and more even mix chart types in a single graph or add 3D and shadow effects.

Quick and Easy Table Creation
Turn comparative text and numeric data into eye-catching tables. Customize grid lines, formatting and justification even automatic cell width and height control.

Row and Column Reordering
Simply click and drag rows or columns to reorder data.

Full Display Control
Customize axes, legend, line styles and data display to emphasize information even set numerical display for percent, decimal, currency and more.

Data Import Support
Save time by importing data from your favorite spreadsheet or database program.

Chart Model Lets You Picture Any Process

Comprehensive Flow Chart Capabilities
Simply point and click to chart the steps of any process, resulting in a clean, crisp flow chart that is easy to follow.

Standard Symbols
Use ANSI-standard process and flow chart symbols and computer network symbols provided, or customize and create your own.

Connector Options
Add emphasis to your diagram by applying different spacing, direction, or color to key connectors.

Built-in Graphics Intelligence Always Available

Smart Graphics
Automatically retain element alignment, spacing, and proportions when editing or scaling charts and graphics.

Smart Line Routing
Maintain connections between elements even when they move! SmartConnector[a] lines automatically route around other elements to ensure clear presentation.

Flexible Data Entry

TA43266_ClarisImpact_Datasheet.pdf

Enter or import information into data tables that transform into professional-looking charts with one click.

Easy Editing
Edit text and values directly on charts or through data tables for quick, clean revisions to your document. Edits are instantly reflected so your work is always current.

Produce business graphics in a wide variety of sizes, shapes and formats.
From impressive overheads and slides to professional reports and documents, to crisp single-page timelines, calendars and wall charts, ClarisImpact lets you deliver your message in the format that will get it noticed.

Share valuable information from other programs, producing results that get noticed!
Read and write data, text and graphics from business applications such as MacWrite*, MacDraw*, FileMaker*, Microsoft Word, Microsoft Excel, and many popular charting programs.

Custom design your documents with a wealth of drawing tools and graphics.
Personalize documents down to the last detail like adding a company logo or creating a department identity using the integrated graphic tools. The clip art library contains thousands of professionally-designed symbols, graphics and high-impact artwork simply drag and drop art into position.

Presentations that are sure to make an impression!
Create powerful online presentations including transition effects, QuickTime movies and multimedia support, and automatic sequential builds. Complete formatting control ensures that all titles, text and graphics placement are consistent throughout your presentation.

Create visually appealing reports in a snap!
With complete word processing capabilities built-in, you do not need any other product to create professional-looking documents. Specify margins, columns, tabs, spacing, and more even enjoy text wrap, footnotes, and spell checking.

Printer Support
- Apple LaserWriter, Personal LaserWriter, and ImageWriter families, and Apple StyleWriter
- Hewlett-Packard LaserJet, DeskWriter, and PaintWriter families
- A wide variety of other Macintosh-compatible, third-party printers

File Format Support
- EPSF (import & export)
- TIFF (import)
- PICT and PICT2 (import & export)
- CGM (import & export)
- MacDraw II, MacDraw Pro (import & export)
- MacPaint* (import)
- QuickTime Movie (import)
- DIF (import)
- GIF (import)
- Microsoft Excel 3.0 (import)
- MacWrite II (import)
- Microsoft Word 3.0, 4.0, 5.0 (import & export)
- RTF (import & export)
- SYLK (import)
- ClarisWorks 1.0, 2.0 word processing and drawing (import)

Also from Claris, ClarisDraw!
Now you can quickly produce everything from simple free-form drawings to complex diagrams with ClarisDraw[a] software. It offers a breadth of drawing, painting and presentation tools that makes it easy to create virtually any graphic you can visualize. ClarisDraw the new Macintosh graphics standard.

Required Equipment
- Apple Macintosh Plus, Centris, Classic, LC, SE, Performa, PowerBook, II, Quadra family computer or Power Macintosh
- Hard disk drive and 2 MB memory
- 4 MB required for System 7
- 8 MB required for Power Macintosh
- System software 6.0.7 or later, System 7, or
System 7 Pro

New Documents Display "Page Setup" Alert When Printing

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Every time a new document is sent to print the message "You have changed your current printer Please choose"Page Setup", but this is a new document and it seems curious that this message would come up.

Reason: The "OPTIONS" file for this application was set while another printer was chosen.

To fix this, create a new document go to page setup and set it for the new, current printer then save the document as a Options/Stationery document as per the instructions for your program.
If looking for this information in your manual, look under Stationery-default in the Index.

Amiga Graphics: Transferring them to the Macintosh (5/94)

A customer wants to transfer DigiPaint (HAM format) and Professional Draw (some type of encapsulated PostScript) files from an Amiga 2500 series computer to the Macintosh (I don't think they care what format). Do you have any suggestions?

This article has been archived and is no longer updated by Apple.
There are a few possibilities that they can investigate. The first is the encapsulated PostScript route. If they can generate these files, there are a number of applications on the Macintosh that can read these files, including Illustrator, FreeHand, and a shareware product called Vision Lab. From these, you can generate PICT files. If they want to use bitmap graphics, DeBabelizer or Adobe PhotoShop on the Macintosh can translate HAM and Amiga IFF graphic files.

On the Amiga, you can use any of programs that store files in either GIF or JPEG. A few of these Utilities are V-Lab, Image-FX, and Art Department. You could then use an application on the Macintosh, such as the shareware programs Giffer, or JPEGView to generate PICT files.

Article Change History:
9 May 1994 - Updated article to include new utilities on both the Amiga and Macintosh.

New and Better Help Systems

New and better help is always a click away. Claris Organizer, ClarisWorks 3.0, ClarisDraw and ClarisImpact usher in new help systems.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Until 1994, Claris products shipped with simple black & white, HyperCard-based help systems. The help screen was sized for small monitors, and could not be expanded. The majority of information about a product was contained in the bulky manuals. Onscreen help was available as a reference, but it wasn't meant to be used in place of the manual. Fortunately, those days are over, and new, improved help systems are here to stay.

The dawn of a new help system

Claris products shipping since 1994 include a new help environment with enhanced features for ease-of-use. Product information is now primarily onscreen, and the manual has been established as a smaller reference.

Opening the new help system, you will notice two differences from older help systems:

- Information is written as full pages of text, rather than as a fixed window size. The help window can be resized, so that the text flows into the available space.

- Headings and topics are displayed in blue text and underlined for identifying key words easily.

The help window

Figure 1 shows the new help window displaying the topic "Shearing an image." The window can be stretched wider and taller, if desired, using the Zoom and Size boxes. On large screens, you can show your document plus the help scrUntil 1994, Claris products shipped with simple black & white, HyperCard-based help systems. The help screen was sized for small monitors, and could not be expanded. The majority of information about a product was contained in the bulky manuals. Onscreen help was available as a reference, but it wasn't meant to be used in place of the manual. Fortunately, those days are over, and new, improved help systems are here to stay.

The dawn of a new help system

Claris products shipping since 1994 include a new help environment with enhanced features for ease-of-use. Product information is now primarily onscreen, and the manual has been established as a smaller reference.

Opening the new help system, you will notice two differences from older help systems:

- Information is written as full pages of text, rather than as a fixed window size. The help window can be resized, so that the text flows into the available space.

- Headings and topics are displayed in blue text and underlined for identifying key words easily.

The help window

Figure 1 shows the new help window displaying the topic "Shearing an image." The window can be stretched wider and taller, if desired, using the Zoom and Size boxes. On large screens, you can show your document plus the help screen at the same time without overlapping the windows. This is a great benefit in that you will not need to print the steps or write them down in order to follow them.

When reading about a topic, you can easily pick out words that are further explained elsewhere in the help. By clicking on a word with a dotted underline and holding down the mouse button, you can expand a description balloon about that word. By clicking on a bold word with a solid underline, you can advance to help on that specific topic. In Figure 1, for example, you could quickly move to the related topics: "Adding perspective," "Distorting an image," and "Selecting an image." The help system makes this easy by supplying special links to other topics.

[See Figure 2 for a sample of the Help System icons. * Ed.]

- Contents button

The Contents screen is a good starting point while you are learning to use the software. You can find overviews of the product's features, and learn how to navigate the help
window.

The Contents portion of the onscreen help is reached in various ways:

- Selecting Contents from the help menu in ClarisWorks 3.0 or in the ClarisDraw application
- Clicking the Contents button within the help screen for all four programs
- Selecting "Help..." under the Apple menu in ClarisImpact, ClarisWorks 3.0, or Claris Organizer

Once you are viewing the Contents screen, all four products offer a choice to see "How to Use Help" (for ClarisImpact, this is called "About Help"). In the contents screen of all but Claris Organizer, you can also jump to a Glossary of terms, a listing of Keyboard Shortcuts, or tips on troubleshooting.

- Keyword button
The Keyword button allows you to see an alphabetical index of terms and topics. This feature is invaluable if you do not know the term used to describe a feature. For example, you may know you want to create some default settings in all future ClarisWorks 3.0 documents, but you don't know the term the program uses. Searching through Keywords, you will come across "defaults." This generates a list of topics including "Save document formatting." After clicking on that topic, you can read the topic and check for related information. One of the underlined titles for further reading is "Create stationery for all new documents." Clicking that title brings you to step-by-step directions for setting up default documents.

- Searching for Words
Using the Search for Help On... in ClarisWorks 3.0, or the magnifying glass search button in any product, you can search by specific words. The help window displays the search results as a list of topics whose text contains your search word. When you click an underlined topic, instances of the term you searched for will be highlighted in the text of that topic. This will draw your attention to paragraphs
relevant to your search.

- Taking notes
As you read the help listing for a subject, you may find that you have your own notes to add. Clicking the note button opens a screen for your personal notes. You can take notes only within topics, so the Notes button is unavailable when viewing lists such as the Keyword list.

When you add a note, a new icon will appear to remind you a note is present in the specific topic.

The "pencil" icon appears next to a topic name to indicate that a personal note is added.

To delete your notes on a topic, click the pencil button to reveal your notes, then delete the text of your note; the pencil icon disappears, indicating that there are no more personal notes for this topic.

- Sharing your notes with others
Your notes are stored in your System Folder. You can display your notes on a colleague's computer by copying the notes file to your colleague's System Folder. Follow these steps on the Macintosh:

1. Copy your Help.note file to a diskette. This file is called ClarisDraw Help.note for ClarisDraw, ClarisWorks Help.note for ClarisWorks 3.0 etc. It is found in your System Folder, inside the folder called Claris.
2. Ask your colleague if any personal notes have been added. If saving personal notes is desired, place your colleague's Help.note file onto another diskette. Notes can be restored any time by placing this note file back in the Claris folder.
3. Copy your notes file from your diskette into your colleague's Claris folder.

The next time your colleague launches the program, there will be full access to your notes. This is useful for annotating instructions for colleagues who aren't as familiar with the programs.

- Topics A-Z button
Clicking on the Topics A-Z button takes you to a view of the alphabet. Here, you can click on a letter to see an alphabetical listing of the help topics that start with that letter. This is similar to browsing the index of a book. However, the difference here is that you can click on a topic to see information about it instantly. When you already know the title of a topic, this can help you quickly move to that topic. The list can also be browsed for items of interest.

The Topics A-Z button can be found on the Contents screen and on the How to Use Help screen in ClarisWorks 3.0 and ClarisDraw. In Claris Organizer, the Topics A-Z button is on the Claris Organizer Basics screen, plus the opening screen. There is no Topics A-Z button in ClarisImpact.

- Return to previous topic
As you are reading about topics, you may decide you landed in a subject in which you're not interested. You can quickly return to the list or topic you saw last by clicking the Previous Topic button.

- Navigation buttons
If you advance to a topic and a navigation button is available (not grayed out), you can scan forward or backward through related topics. This will save the time of returning to a previous topic in order to select another underlined topic.

Help is always a click away

With the development of this new help system, Claris has provided a powerful new tool to assist you in becoming more productive with your Claris products. The resizeable window allows you to size the help screen so that it is comfortable for you. The different ways of searching for information help you streamline the process of moving from related topic to related topic. And, best of all, you can now enter your own notes about a topic right in the Help system itself!

Help Screen Differences in ClarisWorks for Windows.

The Claris Help system for ClarisWorks for Windows operates almost the same as for Macintosh. The new and enhanced features that make the Help system more user-friendly and intuitive assist you in becoming more productive. The few differences are listed below.

- Contents

By choosing Contents from the Help menu you get a general listing of ClarisWorks topics which are available for browsing. When your cursor touches one of the topics (titled in green), it becomes a "pointer." By clicking once on a topic with the pointer it will bring you to more de-tailed information about the selected subject.

- Search for help by topic or key word

When you are not sure what topic to look up, choose "Search for Help on..." under the Help menu. In the resulting Help window that appears, you get a list of all the different topics that have associations with the word you typed in the first search screen. Scan the items in this list and double-click on a topic to find the set of step-by-step instructions associated with the task. If you need additional related information, you can choose from any of the related topics listed at the end of the instructions. Any word highlighted in green letters can be clicked on to get a brief, more descriptive explanation of that highlighted word or term.

- Annotate (Taking Notes)

As in the Macintosh version of the Help system, you can "take notes" at just about any time while you are in the help system. Click on Edit from the ClarisWorks Help menu bar and select Annotate to access the note system. Unfortunately, the notes system is not available when searching for Keywords. However, if notes already exist or when they are added, an icon in the shape of a small green paper clip will appear as the first character at the beginning of the topic's paragraph to indicate that there are notes for that specific topic.
To delete a note, simply click on Edit, Annotate, and highlight the portion of the text to be deleted then click on Delete, then OK. The entire contents of your notes can be deleted by clicking directly on delete and then OK.

- Back

The Back button is similar to the Return to Previous Topic button in the Macintosh version. You can click on the Back button to bring you backward one screen at a time.

- Bookmark

One feature not available in the Macintosh version of the Help system is the Bookmark (click Bookmark from the ClarisWorks Help menu bar). It can be a very useful tool. For example, it enables you to go directly to a particular screen that contains step-by-step directions on how to perform a fairly complex procedure that you may use frequently. Or, perhaps you may choose to set a bookmark for a screen you refer to often, thereby saving yourself the need to click through five submenus in order to get to it. Bookmarks can be created almost anywhere in the help window, except when in the Searching on Keywords Help screen. To create a Bookmark from any other help screen, you just click on Bookmark from the menu bar, choose Define, type a Bookmark name that will help you remember the place you want to keep. "Printing Labels," for example, may be a good name for a Bookmark. Click OK to save the Bookmark name. The Bookmark is then saved and added to the list in alphabetical order.

To recall your Bookmark, click on Bookmark from the menu bar, and all your bookmarks appear in chronological order with the most recent one added being listed at the bottom of the drop-down list. To delete a Bookmark name, click on Bookmark, select define, highlight the Bookmark name that you want to delete by clicking once on the name from the list, click on the Delete button, and click OK when finished.
een at the same time without overlapping the windows. This is a great benefit in that you will not need to print the steps or write them down in order to follow them.

When reading about a topic, you can easily pick out words that are further explained elsewhere in the help. By clicking on a word with a dotted underline and holding down the mouse button, you can expand a description balloon about that word. By clicking on a bold word with a solid underline, you can advance to help on that specific topic. In Figure 1, for example, you could quickly move to the related topics: "Adding perspective," "Distorting an image," and "Selecting an image." The help system makes this easy by supplying special links to other topics.

[See Figure 2 for a sample of the Help System icons. * Ed.]

- Contents button

The Contents screen is a good starting point while you are learning to use the software. You can find overviews of the product's features, and learn how to navigate the help
window.

The Contents portion of the onscreen help is reached in various ways:

- Selecting Contents from the help menu in ClarisWorks 3.0 or in the ClarisDraw application
- Clicking the Contents button within the help screen for all four programs

- Selecting "Help..." under the Apple menu in ClarisImpact, ClarisWorks 3.0, or Claris Organizer

Once you are viewing the Contents screen, all four products offer a choice to see "How to Use Help" (for ClarisImpact, this is called "About Help"). In the contents screen of all but Claris Organizer, you can also jump to a Glossary of terms, a listing of Keyboard Shortcuts, or tips on troubleshooting.

- Keyword button
The Keyword button allows you to see an alphabetical index of terms and topics. This feature is invaluable if you do not know the term used to describe a feature. For example, you may know you want to create some default settings in all future ClarisWorks 3.0 documents, but you don't know the term the program uses. Searching through Keywords, you will come across "defaults." This generates a list of topics including "Save document formatting." After clicking on that topic, you can read the topic and check for related information. One of the underlined titles for further reading is "Create stationery for all new documents." Clicking that title brings you to step-by-step directions for setting up default documents.

- Searching for Words
Using the Search for Help On... in ClarisWorks 3.0, or the magnifying glass search button in any product, you can search by specific words. The help window displays the search results as a list of topics whose text contains your search word. When you click an underlined topic, instances of the term you searched for will be highlighted in the text of that topic. This will draw your attention to paragraphs
relevant to your search.

- Taking notes
As you read the help listing for a subject, you may find that you have your own notes to add. Clicking the note button opens a screen for your personal notes. You can take notes only within topics, so the Notes button is unavailable when viewing lists such as the Keyword list.

When you add a note, a new icon will appear to remind you a note is present in the specific topic.

The "pencil" icon appears next to a topic name to indicate that a personal note is added.

To delete your notes on a topic, click the pencil button to reveal your notes, then delete the text of your note; the pencil icon disappears, indicating that there are no more personal notes for this topic.

- Sharing your notes with others
Your notes are stored in your System Folder. You can display your notes on a colleague's computer by copying the notes file to your colleague's System Folder. Follow these steps on the Macintosh:

1. Copy your Help.note file to a diskette. This file is called ClarisDraw Help.note for ClarisDraw, ClarisWorks Help.note for ClarisWorks 3.0 etc. It is found in your System Folder, inside the folder called Claris.
2. Ask your colleague if any personal notes have been added. If saving personal notes is desired, place your colleague's Help.note file onto another diskette. Notes can be restored any time by placing this note file back in the Claris folder.
3. Copy your notes file from your diskette into your colleague's Claris folder.

The next time your colleague launches the program, there will be full access to your notes. This is useful for annotating instructions for colleagues who aren't as familiar with the programs.

- Topics A-ZÊbutton
Clicking on the Topics A-Z button takes you to a view of the alphabet. Here, you can click on a letter to see an alphabetical listing of the help topics that start with that letter. This is similar to browsing the index of a book. However, the difference here is that you can click on a topic to see information about it instantly. When you already know the title of a topic, this can help you quickly move to that topic. The list can also be browsed for items of interest.

The Topics A-Z button can be found on the Contents screen and on the How to Use Help screen in ClarisWorks 3.0 and ClarisDraw. In Claris Organizer, the Topics A-Z button is on the Claris Organizer Basics screen, plus the opening screen. There is no Topics A-Z button in ClarisImpact.

- Return to previous topic
As you are reading about topics, you may decide you landed in a subject in which you're not interested. You can quickly return to the list or topic you saw last by clicking the Previous Topic button.

- Navigation buttons
If you advance to a topic and a navigation button is available (not grayed out), you can scan forward or backward through related topics. This will save the time of returning to a previous topic in order to select another underlined topic.

Help is always a click away

With the development of this new help system, Claris has provided a powerful new tool to assist you in becoming more productive with your Claris products. The resizeable window allows you to size the help screen so that it is comfortable for you. The different ways of searching for

information help you streamline the process of moving from related topic to related topic. And, best of all, you can now enter your own notes about a topic right in the Help system itself!

Help Screen Differences in ClarisWorks for Windows.

The Claris Help system for ClarisWorks for Windows operates almost the same as for Macintosh. The new and enhanced features that make the Help system more user-friendly and intuitive assist you in becoming more productive. The few differences are listed below.

- Contents

By choosing Contents from the Help menu you get a general listing of ClarisWorks topics which are available for browsing. When your cursor touches one of the topics (titled in green), it becomes a "pointer." By clicking once on a topic with the pointer it will bring you to more de-tailed information about the selected subject.

- Search for help by topic or key word

When you are not sure what topic to look up, choose "Search for Help on..." under the Help menu. In the resulting Help window that appears, you get a list of all the different topics that have associations with the word you typed in the first search screen. Scan the items in this list and double-click on a topic to find the set of step-by-step instructions associated with the task. If you need additional related information, you can choose from any of the related topics listed at the end of the instructions. Any word highlighted in green letters can be clicked on to get a brief, more descriptive explanation of that highlighted word or term.

- Annotate (Taking Notes)

As in the Macintosh version of the Help system, you can "take notes" at just about any time while you are in the help system. Click on Edit from the ClarisWorks Help menu bar and select Annotate to access the note system. Unfortunately, the notes system is not available when searching for Keywords. However, if notes already exist or when they are added, an icon in the shape of a small green paper clip will appear as the first character at the beginning of the topic's paragraph to indicate that there are notes for that specific topic.
To delete a note, simply click on Edit, Annotate, and highlight the portion of the text to be deleted then click on Delete, then OK. The entire contents of your notes can be deleted by clicking directly on delete and then OK.

- Back

The Back button is similar to the Return to Previous Topic button in the Macintosh version. You can click on the Back button to bring you backward one screen at a time.

- Bookmark

One feature not available in the Macintosh version of the Help system is the Bookmark (click Bookmark from the ClarisWorks Help menu bar). It can be a very useful tool. For example, it enables you to go directly to a particular screen that contains step-by-step directions on how to perform a fairly complex procedure that you may use frequently. Or, perhaps you may choose to set a bookmark for a screen you refer to often, thereby saving yourself the need to click through five submenus in order to get to it. Bookmarks can be created almost anywhere in the help window, except when in the Searching on Keywords Help screen. To create a Bookmark from any other help screen, you just click on Bookmark from the menu bar, choose Define, type a Bookmark name that will help you remember the place you want to keep. "Printing Labels," for example, may be a good name for a Bookmark. Click OK to save the Bookmark name. The Bookmark is then saved and added to the list in alphabetical order.

To recall your Bookmark, click on Bookmark from the menu bar, and all your bookmarks appear in chronological order with the most recent one added being listed at the bottom of the drop-down list. To delete a Bookmark name, click on Bookmark, select define, highlight the Bookmark name that you want to delete by clicking once on the name from the list, click on the Delete button, and click OK when finished.

Tabs Skipped After Hanging Indent

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisDraw has a issue with tabs following hanging indents in a text frame that do not have some text entered at the tab. To reproduce the issue, follow these steps:

1. Turn on Text Ruler
2. Create a text frame that extends from 1" to 7.5".
3. Hold down the option key and move the right margin indicator (the sideways triangle on the left side of the ruler) to the 2" marker.
4. Place a left align tab at 2.25".
5. Place a right align tab at 7.25".
6. Press the tab key and type in the number 1.
7. Press the tab key and type in "SomeText"
8. Press the tab key and type in "RightSide"
9. Press the return key.

We are now on the second line of your text frame. We want to add some more descriptive text below "SomeText" without putting in a new line number.

10. Press the tab key. This takes you to the hanging indent.
11. Press the tab key again. Gee, what happened to the cursor?

The cursor has jumped to the right align tab on the right side of the page. Please note that the type of tab is not important, it just skips the first tab after the hanging indent.

The workaround is to enter a <space> after pressing the tab key to get to the hanging indent in step 10.

This issue does not occur in ClarisImpact or ClarisWorks.
Published Date: Feb 18, 2012

Paint Frames and Text Rotate When You Edit Them

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

ClarisDraw allows you to rotate most objects, including text and paint frames. However, the moment you double-click either of these types of objects to edit them, the will immediately snap to zero rotation - in other words, they revert while being edited to the rotation they had when you first created them. For text, that would be completely horizontal; for paint frames, that would be whatever rotation the paint frame had when it was created or placed in the document.

This feature is not "switchable" - it is always in effect. This can cause an issue if the orientation that makes it easiest to edit the image is different from the image's original orientation, or if you are working with scanned images, whose original orientation may not be straight up and down: every time you double-click to edit the image, it will rotate to its original orientation. For that reason, it's much better to start out right by scanning the image with the orientation set to the one you will ultimately want in your finished document.

Claris Announces ClarisWorks 4.0 For Macintosh And Windows

Powerful word processing and database features, time-saving automation, and ease-of-use enhance upgrade of best-selling Macintosh application

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

SANTA CLARA, Calif. May 30, 1995 Claris Corporation, a leading worldwide vendor of Windows and Macintosh software for business, education and home, today announced ClarisWorks 4.0, the smartest, all-in-one program for Windows and Macintosh.

The best-selling Macintosh application, with almost four million users worldwide, ClarisWorks combines a powerful, all-in-one design with expert assistance and time-saving automation features in a single, easy-to-use program. From powerful new word processing capabilities like sections and stylesheets to enhanced database reporting, ClarisWorks 4.0 has the most robust set of features among all other Works programs. And new time-saving automation features such as the ExpressStyle, FastReport, or ReadyArt Libraries, will make ClarisWorks 4.0 users more productive than ever.

"ClarisWorks 4.0 builds on its unsurpassed customer satisfaction, superior integration, and compact, high-performance design to offer customers the most complete combination of award-winning, ease-of-use and robust feature set in its category," said Guerrino de Luca, president of Claris. "With its enhanced, ready-to-use feature set, expert assistance, and time-saving automation tools, ClarisWorks 4.0 is the best software value for Windows and Macintosh users at work, in school, at home, or on the road."

The newest version of this full-featured word-processer, spreadsheet, database, graphics, and presentation, productivity tool adds over 100 new features while still providing excellent performance and retaining an exceptionally compact size (1MB application size, 14MB for full installation one fifth the size of Microsoft Office on a 68K Macintosh.) And it is the only Works program with 100 percent compatible Windows and Macintosh versions.

Powerful Word Processing Capabilities

To speed the formatting and layout of longer documents common in higher education and business settings, ClarisWorks 4.0 adds a host of new word processing capabilities. Leading these is the new ExpressStyle feature that introduces a unique, universal stylesheet metaphor that provides users with the ability to instantly format virtually anything - text, paragraphs, graphics, outlines, and table styles. The floating ExpressStyle palette can be used from within any of the environments so users can easily create and edit styles without navigating cumbersome dialogs or new modes. With the ExpressStyle feature users can choose from several pre-defined styles or create their own custom styles, even share them with other documents and users in an organization.

For formatting more complex documents like reports and theses, ClarisWorks 4.0 now includes section formatting options which allow users to divide a document into separate sections of any length. Users can specify a different number of columns as well as variable column formatting, page numbering and more in each section. Section support also lets users create multiple headers and footers in a document as well as specify whether they appear on left-or-right-facing pages, or both. A new End Notes command automatically places all footnotes at the end of a document, rather than only at the bottom of each page.

Other ClarisWorks 4.0 word processing enhancements include fully integrated outlining within word processing , so users can instantly create and format an outline of any length in a document no separate "mode" is required. The text ruler itself improves usability, with pop-up access to paragraph and outline styles. New font styles superior, inferior and double underline, and Shortcut buttons for uppercase and lowercase add even more options. And ClarisWorks 4.0 now includes a Mail Merge Preview that shows users how database information looks in a merged document before printing.

Beefed-Up Database Features

Major enhancements in the ClarisWorks database help users quickly create databases, view and organize information, and produce reports. The new FastReport feature speeds data navigation and reporting, allowing users to create and save custom searches, sorts, and reports, even printing them automatically. And new buttons in the database tool area provide instant access to all of the layouts, searches, sorts and reports already defined.

ClarisWorks 4.0 adds new power and accessibility to its database with a spreadsheet-like List View, so users can read data in a simple row and column format. List View also makes it easy to manipulate data with columns that can be expanded in size or moved wherever needed. New field types speed database definition and data entry including a smart name field (which allows entry of first and last name in a single field and automatically sorts by the first letter of the last name), as well as radio buttons, check boxes, pop-up menus, record information and pre-defined value fields.

Spreadsheet and graphics enhancements include a spreadsheet Fill Special feature, providing the ability to automatically fill out spreadsheet headings in sequences of month, day, year, and quarter, as well as the ability to create cell-shading by colors and patterns. ClarisWorks 4.0 also provides free rotation capability of any object by one degree increments.

Expert Assistance and Time-Saving Automation

In addition to the new ExpressStyle and FastReport capabilities, ClarisWorks 4.0 provides expert assistance, time-saving automation and enhanced usability. Eleven ClarisWorks Assistants (three new to version 4.0) offer step-by-step guidance and expert advice on layout, design and content or help with complex tasks. The new Mail Label Assistant allows users to select from more than 50 pre-defined Avery mailing label formats, choose exactly which information and in what order to include it on the label, and have the data automatically sized to fit the label. The new Home Finance Assistant calculates net worth or even the right size mortgage or car loan based on salary input and other variables such as interest rate. And the new Certificate Assistant steps users through the process of creating awards and recognition certificates with professional-looking graphic borders, suggested text, and a designated place for a seal.

The new ReadyArt Libraries allow users to store and organize hundreds of frequently-used clip art images, including the 500 pieces of clip art that are included with ClarisWorks 4.0. Users can easily add artwork to any document by simply dragging and dropping images from the library palette or create custom art such as business logos. The ReadyArt Libraries store art as well as text, such as company taglines, and users can easily sort items alphabetically, store different categories in separate libraries, or find an item by searching for it by name.

Other usability enhancements include Automatic Balloons identifying the function of each Shortcut, and a customizable Shortcut palette that can display the name or enlarge the size of buttons. Over 30 templates for home, school and business use are also included.

Internet Authoring with HTML Translator

ClarisWorks 4.0 offers users an easy way to create and read World Wide Web documents, with a built-in HTML (Hypertext mark-Up Language) translator. With ClarisWorks 4.0, authoring a home-page on the Web is easy: simply create the document in the ClarisWorks word processor, assign text styles or hypertext links with a single-click, and then save out as HTML using the built-in translator. The ClarisWorks-created document can be viewed on the Net using any popular web browser such as NetScape or NCSA Mosaic.

Unique Cross-Platform Compatibility

Alone among all-in-one packages, ClarisWorks 4.0 delivers cross-platform compatibility for Windows and Macintosh. With the delivery of version 4.0 for Windows this fall, ClarisWorks will provide the same interface and file format for each platform. ClarisWorks 4.0 for Windows is Windows 95 ready, a full 32-bit application with Windows 95 look and feel, status bar, long-format file naming, and right mouse button support.

Macintosh users will be able to take advantage of System 7.5 capabilities including AppleScript, AppleEvents, PowerTalk, and QuickTime. ClarisWorks 4.0 is also WorldScript ready, supporting Apple Language Kits, enabling customers to integrate 2-byte characters and therefore Chinese, Korean and Japanese text into their multi-lingual documents.

The Compact, Fast and Friendly Office Alternative

With its powerful new word processing and database features, superior usability, compact design and high performance, ClarisWorks 4.0 represents a real alternative to the Microsoft Office for many users in business, education and home settings. While adding over 100 new features, ClarisWorks 4.0 maintains its significant size and performance advantage over both Microsoft Works and Office, especially on the Macintosh. (See also Figure 1.)

	ClarisWorks 4.0	MS Works 4.0	MS Office 4.0
Launch	7.5 sec	8.1 sec	13.9 sec (Word)
Create/Activate Spreadsheet in Word Processor	< 1 sec	3.1 sec	26.2 sec
Text wrap around graphic	< 1 sec	1.9 sec	11.6 sec
Scrolling (10 pg. document with table, chart, graphic)	6.2 sec	14.0 sec	56.2 sec
Document size (1 pg. letter with chart & table)	33K	50K	66K

*All tests performed on a Macintosh Quadra 660AV with 8MB RAM.

System Requirements

ClarisWorks 4.0 for Macintosh requires a Macintosh or Power PC-compatible computer running System 7 or higher with a 68020 or higher processor, a hard disk drive and 4 MB of RAM. ClarisWorks 4.0 for Windows requires a compatible PC with a 386 or higher processor, a hard disk drive, and 8 MB of RAM, VGA or better video, and Microsoft Windows 95.

Pricing and Availability

ClarisWorks 4.0 for Macintosh and Power Macintosh will be available in June for a suggested retail price of $129. ClarisWorks 4.0 for Windows will be available this fall for a suggested retail price of $99. Current users of either ClarisWorks for Macintosh or Windows can upgrade for $49.

Chart Range Cannot be Changed

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisImpact uses the Data Chart Tool to create a chart connected to its data. This connection allows you to change data without clicking into the data table. For example, click on a bar in a bar chart, and then type a new number to change the bar. Although you clicked on a bar, the number in the data table changes.

This is a useful feature, but it creates a limitation: your chart must show all of the data in the table. If you wanted your table to show four columns of information, but you only wanted three columns charted, you would see this limitation:

In the Chart menu, select Range....
Or double-click the chart, and select the Range tab.
In the Range window, you may expect to be able to specify three columns instead of four, but the Range is fixed, unchangeable.

The solution is to separate the chart from the data. You will lose the connection between the data points and the chart elements (the click-on-a-bar example, above), but you can then specify a different chart range. You can still update the chart by changing numbers in the data table, but clicking on a chart element will not select the data cell automatically.

Reference Files Used by Claris Applications

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Listed are the relationships between Claris Macintosh applications and Claris reference files. Version numbers have been cited only where necessary, and information is arranged by reference file type, then application name:

Main Dictionary
MacDraw II, MacDraw Pro; MacProject Pro; Claris Resolve; ClarisImpact, ClarisDraw; FileMaker Pro, FileMaker Pro SDK; MacWrite II, MacWrite Pro; ClarisWorks.

Thesaurus
MacWrite Pro; ClarisWorks 1.0 and above; ClarisImpact, ClarisDraw

Hyphenation
MacWrite Pro; ClarisWorks 2.1 and above.

Note:
1) FileMaker II and MacProject II do not support spell checking, autohyphenation, or thesaurus
2) MacWrite II also supports autohyphenation, but requires the original MacWrite II hyphenation file for this purpose. MacWrite II will not recognize or load the new standalone hyphenation files.

Claris Offers Aggressive Promotional Bundle For ClarisDraw

ClarisDraw Value Pack for $199 in limited time offer -- comes bundled with ClarisImpact

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

SANTA CLARA, CALIF. -- May 8, 1995 -- In a move designed to offer tremendous value and expand the appeal of general purpose drawing software, Claris Corp. today announced the ClarisDraw Value Pack, a new promotional bundle featuring its flagship drawing program and its award-winning charting and diagraming program, ClarisImpact.

The ClarisDraw Value Pack has a promotional price of $199, compared to ClarisDraw's suggested retail price (SRP) of $399. The promotion is in effect immediately and runs through September 30, 1995.

"This pricing move is right on for ClarisDraw," said Chris LeTocq, president of industry analyst firm SoftTracks. "It puts Claris in an even stronger leadership position in the Mac drawing market. The addition of charting and diagraming capabilities from ClarisImpact offers users a compelling business graphics solution," he added.

"We've talked to our ClarisDraw customers, and they have told us they want the ability to do charting and diagraming, as well as freeform graphics, so we're responding with the ClarisDraw Value Pack," said Michael Sanabria, ClarisDraw product manager. "We are also reaching out to new buyers who may be considering higher priced and more difficult illustration applications as a way to further grow the draw category."

ClarisImpact has a current suggested promotional price of $149. Now users buying the best general drawing program in ClarisDraw can also easily create compelling business charts and diagrams with ClarisImpact.

ClarisImpact, which will be offered on CD-ROM in the box, offers users a fast and easy way to create organizational and flow charts, network diagrams, time lines, calendars and a variety of other business graphics.

About ClarisDraw

ClarisDraw provides all the drawing tools needed to create freeform art, technical illustrations, process diagrams, space planning, light desktop publishing, and can easily master virtually any graphics task. ClarisDraw's features include intelligent alignment and connection capabilities, color painting and image editing, advanced text effects, drag and drop clip art libraries, over 2,400 high quality pieces of clip art, and full compatibility with the upcoming Windows release due later this year. ClarisDraw is the ideal product for the non-artist in business and engineering who needs a versatile, reliable and easy to use graphics product.

ClarisDraw for Macintosh and Power Macintosh has won raves from users and trade magazine reviews since shipping in August of 1994. ClarisDraw's performance has sustained the dominant position Claris has in the Macintosh drawing market created with the MacDraw family of general drawing programs.

About ClarisImpact

ClarisImpact for Macintosh and Power Macintosh is the award-winning business charting and diagraming application for users interested in easily creating organizational and flow charts, network diagrams, data charts, project time lines, calendars and other business graphics.

Its intuitive interface and ability to help the non artist quickly create business graphics that look professional is a big productivity booster compared to other traditional methods of working with business graphics. Prior to ClarisImpact, users had to work with numerous applications and charting utilities, cutting and pasting graphics between their spreadsheet, utility program and word processor or presentation application. ClarisImpact streamlines this process, and allows for editing of graphics on the fly, since graphics are always live, whether in a drawing, report or presentation.

Availability

The new ClarisDraw Value Pack offer can be purchased immediately direct from Claris, through corporate resellers and retail outlets. Editors can refer interested readers to the Claris, and a variety of Internet and online forums for product information, including:

- ClarisWeb: http://www.claris.com.
- America Online, keyword: CLARIS
- CompuServe: GO CLARIS
- Claris BBS

ClarisDraw has an SRP of $399. Customers who bought ClarisDraw in April of 1995 can purchase ClarisImpact software for a minimal shipping and handling charge, direct from Claris only. Customers who purchased ClarisDraw prior to April may buy ClarisImpact for a special promotional price of $49, plus shipping and handling, also direct from Claris only.

TA43278_Claris_Offers_Aggressive_Promotional_Bundle_For_ClarisDraw.pdf

ClarisImpact has a current suggested promotional price of $149. Claris offers a variety of volume pricing agreements and discounted pricing for educational institutions.

On Location Freezes when Trying to Index the Claris Folder

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
A user of On Location, a text search and retrieval utility, has reported that the utility freezes when it scans the Claris Translators in the Claris folder inside the System folder. The scanning is done when On Location creates an index.

Removing the Claris folder from the System folder before creating the On Location index allows the indexing to proceed successfully. The Claris folder can then be returned to the System folder.

This behavior has not been verified by Claris Technical Support. Specific version information is unknown at this time.

Macintosh: Rocky Mountain BASIC Equivalent Needed

I use Rocky Mountain BASIC on an HP. Is there a similar package for the Macintosh?

This article has been archived and is no longer updated by Apple.
The only implementation of BASIC for the Macintosh that is remotely similar to "Rocky Mountain BASIC" for the HP9000 series is Microsoft QuickBASIC. There are numerous differences, especially considering the machine-specific details of each BASIC. Rocky Mountain BASIC uses many commands and parameters that mean nothing to computers other than HP9000 systems. Likewise, Microsoft QuickBASIC uses Macintosh-specific commands that do not exist on other computers and a command syntax in traditional Microsoft BASIC style--a style much different than that of Hewlett-Packard's BASIC.

They do share the important ability to use subprograms and functions, but the method of implementing these is quite different between the two languages. Microsoft QuickBASIC would give you a powerful BASIC. However, porting anything other than the simplest programs from Rocky Mountain BASIC will not be a trivial task. This is especially with programs that are I/O-intensive, because these tend to be the areas where the languages differ the most.

There are some definite benefits to using Microsoft QuickBASIC over HP's BASIC, like advanced debugging features (breakpoints and animated tracing for source-level debugging) and a simpler mouse interface. Users can quickly grow accustomed to the Microsoft QuickBASIC product, while Rocky Mountain BASIC has a cruder interface and takes more time to master. Of course, you are already using Rocky Mountain BASIC, so the change in programming environment will have an impact to the degree that you are familiar with Macintosh user interface conventions.

If you need additional information on Microsoft QuickBASIC, we suggest that you contact Microsoft directly. They should be able to provide more up-to-date information and could, perhaps, assist in deciding if their product will fit your requirements. For more details, search the Technical Info library under "Microsoft Corp AND WA"

We should mention that at least one company sells what is essentially a clone of Rocky Mountain BASIC for MS-DOS computers. These products provide a command set and environment that is very similar to HP's. Unfortunately, we do not know of any plans for similar products for the Macintosh. The closest would be to use one of these BASIC clones on an MS-DOS emulator, like SoftPC or Mac286--not a very elegant solution.

ClarisWorks: About Version 4.0 Macintosh, Read Me

A complete copy of the ReadMe file from the ClarisWorks 4.0 Mac installation

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

WELCOME TO CLARISWORKS 4.0!

Thank you for choosing ClarisWorks 4.0. We're excited about this latest release of ClarisWorks and know that it will help you to be more productive and creative. This Read Me file documents some additional tips that may prove helpful when using ClarisWorks 4.0, including changes for users of previous versions of the program. In particular, this document provides information about:

I. New features in ClarisWorks 4.0
II. Usability and design changes in version 4.0
III. Technical notes and tips

I. NEW FEATURES IN CLARISWORKS 4.0

ClarisWorks 4.0 has over 100 new features. Almost every aspect of ClarisWorks is more powerful and easier to use, especially word processing and database. In addition, ClarisWorks 4.0 adds a host of new capabilities to assist you in your work and to automate many common, but previously complex, tasks. Some of the highlights are listed below. For more information, consult the ClarisWorks User's Guide and on screen Help.

Word Processing
- Stylesheets
- Fully integrated outlining in word processing
- Paragraph/outline styles pop-up menu in text ruler
- Sections
- Multiple headers and footers
- Left/right/facing pages
- Endnotes
- Built-in HTML translator and stationery for creating documents for the Internet
- Enhanced mail merge (to show database data in word processing documents)
- New font styles (superior, inferior, double-underline)

Database
- Automatic list view
- New field types (name, radio buttons, check boxes and more)
- Reusable searches, sorts, and reports (FastReport feature)
- Pop-up menu access to layouts, searches, sorts, and reports
- New Mailing Label Assistant

Drawing
- Drag and drop ClarisWorks ReadyArt library feature
- 500 clip art images in ClarisWorks Libraries
- Free rotation

Spreadsheet
- Fill Special (automatically fill in day, month, year, etc.)
- Cell shading

Assistance, Automation, and Usability
- New ClarisWorks Assistants, including Mailing Labels, Home Finance, and Certificate
- ExpressStyle feature: reusable, universal styles for text, paragraphs, outlines, graphics, and tables
- Four sample AppleScripts for converting batches of documents, printing batches of documents, running remote slide shows, and using FileMaker Pro data for mail merge
- Instant help (automatic balloons) for Shortcut buttons
- Display of Shortcuts by name or enlarged buttons

Macintosh Operating System Support
- AppleEvents and AppleScript support
- WorldScript support for multi-language documents
- EGO (Edit Graphic Objects) AppleEvent support, for example, for external equation editors

II. USABILITY AND DESIGN CHANGES IN VERSION 4.0

Editing Charts and Formatting Chart Elements
In previous versions of ClarisWorks, chart elements such as axes labels and legend text took their font, size and size attributes from the formatting of the cells being charted in the ClarisWorks spreadsheet. If the formatting changed, so did the chart.

In version 4.0, you can format chart elements directly. For example, to format legend text, click the legend to select it, and then use the commands in the Format menu to apply font, size, and style attributes.

Working with Stationery and Assistants: Location on Disk
In previous versions of ClarisWorks, the ClarisWorks Assistants and ClarisWorks Stationery folders were located in the Claris folder in the System Folder. When you created new documents, ClarisWorks looked in those folders for the Assistants and Stationery choices displayed in the New Document dialog box.

With ClarisWorks 4.0, the ClarisWorks Stationery, ClarisWorks Assistants, ClarisWorks Libraries, ClarisWorks Scripts, and ClarisWorks Styles folders are located in the ClarisWorks 4.0 folder, not in the Claris folder.

When you create stationery documents in version 4.0, put them in the ClarisWorks Stationery folder in the ClarisWorks 4.0 folder. Then you'll see the stationery documents as choices when you create new documents. Similarly, you may want to put libraries you create in the ClarisWorks Libraries folder so that they will be accessible when you use the Library command in the File menu.

Note: If you are using System 7.5, we recommend that you reset the location where your documents are saved.
1. From the Apple menu, choose General Controls and then Control Panels.
2. Under Documents, click "Folder which contains the application."

Working with Text Styles Created in ClarisWorks 2.0, 2.1, and 3.0
In ClarisWorks 2.0, 2.1, and 3.0, you could create reusable text styles with your favorite settings for font, size, style and text color. These text styles were added to the Style menu and assigned a Command key equivalent.

ClarisWorks 4.0 supports many different reusable styles for text, paragraphs, outlines, graphics, and tables. When you open ClarisWorks 2.0, 2.1 and 3.0 documents in ClarisWorks 4.0, all existing text styles are added to the new Stylesheet palette.

To use these styles in your converted documents:
1. Choose Show Styles from the View menu.
2. Select the text you want to format using an existing style.
3. In the Stylesheet palette, click the name of the style that you want to apply to the selected text.

Working with Mail Merge
Because of file format changes in ClarisWorks 4.0, you need to update the field variables in merge documents created in previous versions of ClarisWorks.

Note: Field variables (for example, <<address>>) are database field names surrounded by the delimiter symbols << and >>. A merge document is a ClarisWorks document, such as a form letter, that contains field variables.

To update your merge document:
1. Open the merge document and then choose Mail Merge from the File menu.
2. In the New Document dialog box, navigate to and select the ClarisWorks database document that contains the fields you want to merge, and then click Open.
3. In the merge document, select the first field variable. Be sure to include its surrounding delimiters.
4. In the Mail Merge palette, select a field from the Field Names list and click Insert Field.
5. Repeat Steps 3 and 4 for each field in the merge document.
6. Save the merge document by choosing Save from the File menu.

III. TECHNICAL NOTES AND TIPS
Using Documents Created in ClarisWorks 2.0, 2.1, and 3.0
ClarisWorks 4.0 has a different file format than ClarisWorks 2.0, 2.1, and 3.0 (which used the same file format).

When you open version 1.0, 2.0, 2.1 and 3.0 files in ClarisWorks 4.0, you will see the message "This document was created by a previous version of ClarisWorks. A copy will be opened and '[v4.0]' will be added to the filename."

To replace your ClarisWorks 1.0, 2.0, 2.1, or 3.0 files with ClarisWorks 4.0 versions, choose Save or Save As from the File menu, remove [v4.0] from the file name, and click Yes when ClarisWorks asks if you want to replace the existing file. If you are converting a number of files to the 4.0 file format, you can turn off the warning and the [v4.0] filename suffix by choosing Preferences from the Edit menu and deselecting "Old Version Alert" and "[v4.0] Suffix."

Note: Because of changes in ClarisWorks 4.0 to support WorldScript, you may need to reformat some documents that you have converted from previous versions of ClarisWorks.

Important: At this time, ClarisWorks 4.0v1 reads files from earlier versions of the product but it does not save (write) them in the earlier version. Once you save a file in 4.0 format, older versions of ClarisWorks can't open it. If you want to preserve the original document, rename converted documents when you save changes.

Using ClarisWorks 3.0 and 4.0 on the Same Macintosh
Some users may want to have both versions 3.0 and 4.0 on their Macintosh*. (You might choose to do this if others in your organization have older versions of ClarisWorks.) Keep in mind that:

- ClarisWorks versions 4.0, 2.0, 2.1 and 3.0 all use the same "creator," so the desktop documents icons for documents created in older versions of ClarisWorks will look the same as the desktop document icons of documents created in version 4.0.

- For the same reason, the ClarisWorks 3.0 application will show the version 4.0 application icon on the desktop.

- ClarisWorks 3.0 uses Assistants and Stationery stored in the Claris folder in the System folder, while ClarisWorks version 4.0 uses the Assistants and Stationery stored in the ClarisWorks 4.0 folder. See "Working with Stationery and Assistants: Location on Disk" in Section II for details.

Sharing Files with ClarisWorks 4.0 for Windows
ClarisWorks 4.0 for Macintosh has the same file format, user interface, and features as the upcoming ClarisWorks 4.0 for Windows. ClarisWorks 4.0 for Macintosh also opens files created in ClarisWorks for Windows versions 1.0 and 3.0 and converts the files to version 4.0 format. When ClarisWorks 4.0 for Windows is available, you will be able to create a ClarisWorks document on Windows and edit it on a Macintosh computer or vice versa. Consequently, if you work with both Macintosh and Windows versions of ClarisWorks, or if you collaborate with colleagues who use ClarisWorks 4.0 for Windows, you can work without translating files or learning a different program.

Due to differences between Macintosh and Windows platforms, you must use a file transfer program such as PC Exchange, AccessPC, or a similar utility to transfer files via floppy disk. These utilities require that your Macintosh have a high density drive (FDHD SuperDrive). Follow the directions in the documentation of the file transfer utility program. After copying the files to or from a PC-formatted disk, rename the files with DOS-compatible filenames (8 characters or less) and include the .CWK extension.

After renaming your files, you can copy them to your computer's hard drive and open them as you would any ClarisWorks document.

Fonts, margins, page breaks, and graphics may look different after they are transferred from the Macintosh. You can minimize unintended font changes by using TrueType fonts on both platforms. Helvetica on the Macintosh converts well to Arial on Windows, and Times converts well to Times New Roman. To restore the original page breaks, you may need to change the margins and page breaks. QuickTime movies will be converted to PICT images. Some macros created on the Macintosh may not run as expected on Windows. In these cases, you'll need to recreate those macros.

Editing Documents Created with the ClarisWorks Assistants
Some documents created using the ClarisWorks Assistants or provided as Stationery files contain objects that are locked or grouped. (Locking and grouping keeps text and graphics objects in position and prevents accidental edits.)

To unlock and ungroup objects so you can move or edit them:
1. If the Arrow tool isn't selected, click it, and then select the object.
2. Choose Unlock or Ungroup from the Arrange menu. If an object is both locked and grouped, first unlock it and then ungroup it.

To edit a text object, click the Text tool and then click the text you want to edit.

Adjusting ClarisWorks Memory
In most cases, the preset memory allocation is adequate for working on ClarisWorks documents. However, if you are working with large Paint documents, very long documents, or if you have several large documents open at the same time, you may see the message "Not enough memory to complete this operation" or "The document has been reduced to fit the available memory." These messages mean that you need to increase the amount of memory set aside for ClarisWorks. Increasing the memory allocation may also reduce the time it takes to print some documents.

To increase the memory allocation for ClarisWorks:
1. If ClarisWorks is open, quit the application.
2. Open the folder that contains the ClarisWorks 4.0 application.
3. Click the ClarisWorks application icon once. (If you click the icon twice, you will start ClarisWorks. If that happens, choose Quit from the File menu and try again.)
4. Choose Get Info from the File menu.
5. Double-click the Preferred Size box.
6. Type a larger number to increase the memory size. If your computer has 4 MB, try 2000. On computers with 5 MB or more, try adding 1000 MB or more to the Preferred size.
7. Close the ClarisWorks Info window.

TA43281_ClarisWorks_About_Version_Macintosh_Read_Me.pdf

Running the Introduction to ClarisWorks

If you try to run the Introduction to ClarisWorks on a computer with a monitor set to Thousands or Millions of colors, you may see the message, "Not enough memory to run MacroMind Player." Either free some memory by resetting your Monitors Control Panel to 256 colors, or increase the memory for the Introduction to ClarisWorks file using the instructions in the previous section, "Adjusting ClarisWorks Memory."

Printing on a LaserWriter IIg/IIf

If the horizontal or vertical lines in your documents are not printing correctly, you can adjust your LaserWriter.

1. Open the LaserWriter Utility application on the LaserWriter disk tools disk that came with your printer.
2. Choose Set PhotoGrade[a] from the Utilities Menu.
3. Move the slider all the way to the left towards the More Levels of Gray option.
4. Quit the LaserWriter Utility application.

Using the Sample AppleScripts

Version 4.0 includes four sample AppleScript scripts that illustrate the use of AppleScript to automate ClarisWorks functions. The four AppleScript scripts are located in the ClarisWorks Scripts folder in the ClarisWorks 4.0 folder:

- Convert Documents (converts multiple non-ClarisWorks files, or files created in earlier versions of ClarisWorks, to ClarisWorks 4.0 format)
- Print Documents (prints multiple ClarisWorks documents)
- Mail Merge (merge FileMaker Pro database data into ClarisWorks documents)
- Remote Slide Show (runs ClarisWorks slide shows from remote Macintosh)

For more information on these scripts, consult the About the AppleScripts document stored in the ClarisWorks Scripts folder. For more information on the Apple Events supported by ClarisWorks 4.0, consult the ClarisWorks Apple Events List document in the ClarisWorks Scripts folder. (The document assumes familiarity with Apple Events and AppleScript.)

Note: AppleScript is provided with System 7 Pro and System 7.5. If you're using System 7.0 and 7.1, AppleScript is available from Apple Computer Inc. The Mail Merge and Remote Slide Show scripts require AppleScript version 1.1.

Using the HTML Translator for Creating Documents for the Internet

ClarisWorks 4.0 includes a translator for converting ClarisWorks word processing documents into HTML files, the format commonly used for documents that can be browsed on the Internet World Wide Web. For more information on using the HTML translator, see the document HTML Primer in the ClarisWorks 4.0 Folder.

AppleEvents in ClarisWorks 4.0

The complete listing, with descriptions, of AppleEvents in CW 4.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Required Suite: Terms that every application should support

open: Open the specified object(s)
open alias-- list of objects to open

print: Print the specified object(s)
print alias-- list of objects to print

quit: Quit application
quit

run: Sent to an application when it is double-clicked
run

Standard Suite Subset: Standard Definitions

close: Close an object
close item-- the object to close
[saving yes/no/ask]-- Specifies whether or not changes should be saved before closing
[saving in alias]-- the file in which to save the object
[as type class]-- the type of file in which to save the document
[using string]-- the name of the XTND translator to use to save the document

open: Open the specified object(s)
open alias-- list of objects to open
[using string]-- the name of the XTND translator to use to open the file
[as DR/WP/SS/DB/PT/CM]-- the type of document as which to open the file

print: Print the specified object(s)
print alias-- list of objects to print
[merge alias]-- list of database files to merge

[one copy boolean]-- print one copy without displaying the print dialog?

quit: Quit application
quit
[saving yes/no/ask]-- specifies whether to save currently open documents

save: Save a document
save document-- the document to save
[in alias]-- the file in which to save the document
[as type class]-- the type of file in which to save the document
[using string]-- the name of the XTND translator to use to save the document

Class application: An application program
Elements:
document by numeric index, by name, as a range of elements
window by numeric index, by name, as a range of elements
Properties:
current slide slide [r/o] -- the current slide being displayed in a slide show

Class document: an open document

Class window: a window

Miscellaneous Standards Subset: Miscellaneous definitions

cut: Cut the current selection to the clipboard

cut

copy: Copy the current selection to the clipboard
copy

paste: Paste from the clipboard to the current selection
paste

do script: Execute the specified macro

do script anything-- the name of the macro to run

do menu: select a menu item and perform its action
do menu menu item-- the menu item to be selected

Class menu: A menu
Plural form:
menus
Elements:
menu item by numeric index, by name, as a range of elements
Properties:
name string [r/o]-- the name of the menu
ID small integer [r/o]-- the menuÕs ID

Class menu item: A menu item
Plural form:
menu items
Properties:
name string [r/o]-- the name of the menu
index integer [r/o]-- the menu item number

ClarisWorks Suite: Definitions specific to ClarisWorks

start slides: Start the slide show for the current document
start slides

stop slides: Stop the slide show, returning to the normal application state
stop slides

display: Go to a specific slide
display slide -- the slide to be displayed

Class slide: A slide which may be displayed in the slide show
Plural form: slides

Claris Ships ClarisWorks 4.0 For Macintosh And Power Macintosh

"ClarisWorks 4.0 makes everything even easier to do. It's that simple," say beta testers.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
SANTA CLARA, Calif. -- June 14, 1995 -- ClarisWorks 4.0, the number one, best-selling all-in-one software for Macintosh, is now shipping and available from authorized Claris resellers across the U.S. and directly from Claris Corporation. ClarisWorks 4.0 for Windows 95 will be available this fall.

With almost four million users worldwide, ClarisWorks 4.0 is the smartest all-in-one program for business, education and home, combining a powerful, compact design with expert assistance and time-saving automation features in a single, easy-to-use program. From powerful new word processing capabilities like sections and stylesheets to enhanced database reporting, ClarisWorks 4.0 has the most robust set of features among all-in-one programs.

"The ClarisWorks 4.0 ready-to-use focus is designed so that users can begin working immediately," said Chris LeTocq, principal of SoftTracks, a Los Altos, Calif.-based market research firm. "And saving time is the number one priority of small business and home office users."

Expert Assistance and Time-Saving Automation

ClarisWorks 4.0 provides expert assistance, time-saving automation and enhanced usability enabling ClarisWorks 4.0 users to be more productive than ever. Three new ClarisWorks Assistants (Mail Label, Home Finance, and Certificate -- eleven total Assistants) offer step-by-step guidance and expert advice on document layout, design and content or help with complex tasks. New time-saving automation features include: ExpressStyle[a], which redefines the stylesheet metaphor enabling users to instantly format not only text and paragraphs, but also graphics, outlines and tables; FastReport[a], to automate searching, sorting, and reporting of frequently used data; and ReadyArt[a] Libraries, so users can store and organize hundreds of frequently-used clip art images (500 clip art images included with ClarisWorks 4.0.)

Arthur Dechene, a new home sales manager in Austin, Texas uses ClarisWorks at home and in the office. "The new ClarisWorks automation features are real time-savers. I really like the ExpressStyle feature because now I can instantly format outlines, regular text, paragraphs or whatever. The spreadsheet Fill Special feature also helps speed me through my work. Now with just one command, the month, date and year are automatically put into the spreadsheet."

"The Certificate Assistant is a great feature for schools because now instead of buying certificates we can easily create them ourselves," said Jan Clough, speech therapist for the Modoc County Office of Education in California. "The Mail Label Assistant is also terrific because if you don't have time to do the layout, you can just put the information in and the labels are automatically made for you."

Sharon Gray, a computer lab manager and teacher's aid at the Hawkins Elementary School in Hawkins, Texas uses ClarisWorks at school, at home and for her husband's construction business. "ClarisWorks 4.0 makes everything even easier to do. I really like the drag-and-drop ReadyArt libraries because you can store and manage all your graphics right there. You just select the graphic you want and insert it. It's that simple."

Powerful New Word-Processing and Database Features

To speed the formatting and layout of longer documents common in higher education and business settings, ClarisWorks 4.0 adds a host of new word processing capabilities, including ExpressStyle (universal stylesheets), sections, multiple headers and footers, left-and-right-facing pages, end notes, integrated outlining, new font styles, and mail merge preview.

ClarisWorks 4.0 adds new power and accessibility to its database with the new FastReport feature for custom searching, sorting, and reporting, and a spreadsheet-like List View so users can read data in a simple row and column format. Other database enhancements, such as the smart name field (one field for first and last name which automatically sorts by the first letter of the last name) and new radio buttons, check boxes, and pop-up menus, let users access and use information much more efficiently.

"I'm really impressed with the powerful new database features in ClarisWorks 4.0 like List View and the new tool panel buttons," said entrepreneur Norm Gulkis, owner of Pro-Mark Inc., whose company produces trade shows for the gift souvenir and novelty industry. "List View makes my job easier by doing all the formatting for me when I need to print a list of customers. The new FastReport feature also saves a lot of time because I can do everything right on screen and then save the criteria. I may have 10 different report formats and now all I have to do is click on the box, pick out the report I want and then print."

Internet Authoring with HTML Translator

ClarisWorks 4.0 offers users an easy way to create and read World Wide Web documents, with a built-in HTML (Hypertext Mark-up Language) translator.

Phil Biggs, instructional technology coordinator for the Greeley/Evans School District in Weld County, Colorado said, "I'm really excited about the built-in HTML translator in ClarisWorks 4.0. Many schools are starting their own web sites and need an easy way to create World Wide Web documents. The ClarisWorks HTML capability is awesome and will really be a big draw for our schools."

Unique Cross-Platform Compatibility

Alone among all-in-one packages, ClarisWorks 4.0 delivers cross-platform compatibility for Windows and Macintosh. With the delivery of version 4.0 for Windows 95 this fall, ClarisWorks will provide the same interface and file format for each platform. Macintosh users will be able to take advantage of System 7.5 capabilities including AppleScript (four sample scripts are included), AppleEvents, PowerTalk, and QuickTime. ClarisWorks 4.0 for Macintosh is also WorldScript ready, supporting Apple Language Kits, enabling customers to integrate 2-byte characters and therefore Chinese, Korean and Japanese text into their multi-lingual documents.

The Compact, Fast and Friendly Office Alternative

With its powerful new word processing and database features, superior usability, compact design and high performance, ClarisWorks 4.0 represents a real alternative to the Microsoft Office for many users in business, education and home settings. While adding over 100 new features, ClarisWorks 4.0 maintains its significant advantage in compact size and performance over both Microsoft Works and Office, especially on the Macintosh.

System Requirements

ClarisWorks 4.0 for Macintosh requires a Macintosh or Power PC-compatible computer running System 7 or higher with a 68020 or higher processor, a hard disk drive and 4 MB of RAM.

Pricing and Availability

ClarisWorks 4.0 for Macintosh and Power Macintosh is available now from authorized Claris resellers in the U.S. for a suggested retail price of $129. ClarisWorks 4.0 for Windows 95 will be available this fall for a suggested retail price of $99. Current users of either ClarisWorks for Macintosh or Windows can upgrade for $49.

ClarisWorks 4.0 Disk Contents (Macintosh) and Installation Guide

An itemized list of the disk files for ClarisWorks 4.0 for the Macintosh and where they will be installed on your hard drive.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The ClarisWorks 4.0 High Density Disk Set for the Macintosh (a total of 6 disks) contains the following items. File sizes of individual items are approximate. These are compressed files and will be uncompressed during the installation process.

Disk 1
Install ClarisWorks (1336K)
ClarisWorks 4.0 Read Me (24K)

Disk 2
Install ClarisWorks.2 (1344K)

Disk 3
Install ClarisWorks.3 (1344K)

Disk 4
Install ClarisWorks.4 (1344K)

Disk 5
Install ClarisWorks.5 (1344K)

Disk 6
Install ClarisWorks.6 (504K)

You will need approximately 18.6 MB of free space on your hard drive to do an Easy Install. When doing an Easy Install, the contents of the disk set will be installed onto the hard disk as itemized below.

At the root (main) level of your hard drive:
ClarisWorks 4.0 folder (folder)

ClarisWorks 4.0 System Requirements (Macintosh)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The minimum system requirements for ClarisWorks 4.0 for Macintosh are as follows:

Macintosh or Power Macintosh with 68020 or higher processor
Hard disk drive (internal or external)
4 MB RAM
System software version 7.0 or later
Hard disk space:
minimum installation: 1 MB (Macintosh), 2 MB (Power Macintosh)
full installation: 17.5 MB

NOTE: Due to the requirement of a 68020 or higher processor, ClarisWorks 4.0 will not run on the following machines: Plus, SE, Classic, and PowerBook 100.

On page 1 of the ClarisWorks 4.0 Installation Guide, it states that System Update 3.0 is recommended for customers using System 7.1, 7.1.1, or 7.1.2 and that System 7 tune-up version 1.1.1 is recommended if you are using System 7.0 or 7.0.1. This information is intended only as helpful advice, relating to the general use of your Macintosh computer.

The tune-up addresses many system-level issues relating to memory, file storage, speed and printing which could affect any of the programs you use on your Macintosh. Similarly, the System Update 3.0 provides system-level improvements to increase overall system performance and reliability on most Macintosh models.

Both of these updates are designed by Apple Computer to improve the functioning of your computer at the system level. They are not required to operate your computer or to run ClarisWorks.

These updates can be obtained at Apple Software Updates online. Please contact Apple Computer regarding further information.

Disk Error Messages During Installation

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
An alert may appear during installation that says "A disk error occurred while reading from the disk. Please contact technical support for help. IO Error (Bad Disk)" . Here's what you can do to try to fix the issue, before ordering replacement disks.

1. Fixing a damaged Desktop file
The desktop file on the floppy disk may be damaged or unreadable. To rebuild the desktop, first drag the floppy disk icon to the trash, so that it's icon is not visible on the computer screen. Hold down the option and command keys and insert the disk. You'll see an alert that says "Are you sure you want to rebuild the desktop." Release the keys on the keyboard and click OK.
Repeat this for the remaining installation disks. Then try installing again.

2. Try copying the floppy disk to the hard drive. (Drag the floppy disk icon onto the hard drive icon). The contents of the floppy will be copied to a new folder, with the same name as the floppy. Then copy the contents of this folder to a new disk (open the folder and drag the contents; don't drag the folder itself). Rename the new disk to the same name as the folder. Then reinstall using the new disk in place of the bad one.

3. Try running Norton Disk Doctor on the floppy disk to repair it.

4. If the disk is unreadable or you can't copy it to the hard drive, try step #2 above on a different computer. The disk may be readable on another computer.

5. Try a custom installation to install just the application, instead of an Easy Install. (In the installer window, click on Easy Install and select Custom Install). If that works, try a Custom Install of another item, such as the Help files. Try installing each item, one at a time, from the Custom Install window.

Claris Announces ClarisImpact 2.0 For Windows And Macintosh, about version 2.0, Press Release

Claris storms Windows business diagraming market with most complete, easy-to-use charting and diagraming application

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
PC EXPO, New York -- June 20, 1995 -- Claris Corporation today announced ClarisImpact 2.0, bringing Windows and Macintosh users the broadest range of quality business graphics for all their charting and diagraming needs. ClarisImpact 2.0 is in full beta-testing and on schedule to ship to U.S. resellers in August with a suggested retail price (SRP) of $129.

ClarisImpact 2.0 lets users automatically create connected diagrams (organizational charts, flow charts, computer diagrams, brainstorm charts, total quality management charts and more), project time lines, calendars, data charts, and freeform graphics in one easy-to-use application. ClarisImpact 2.0 for Windows is a 32-bit application ready for Windows 95, and the Macintosh version is native for Power Macintosh, providing great performance on both systems.

"ClarisImpact 2.0 will lead the business diagraming category for ease-of-use, breadth of chart types, speed of task completion, and cross-platform compatibility," said Guerrino De Luca, president of Claris. "We're very excited to be the only cross-platform charting solution for our many customers who work in mixed computing environments.

New to ClarisImpact 2.0 are brand-new styles providing users with professionally designed art for creating the best looking graphics in color or black and white, whether in text-based reports, on-screen presentations or overhead transparencies.

Also new to ClarisImpact 2.0 is DataDraw, which instantly creates graphics from any tab or comma separated data in a database or spreadsheet. For example, ClarisImpact 2.0 can take records from a human resources database and automatically generate an organizational chart. Or a spreadsheet used for managing project dates can be instantly turned into a time line for at-a-glance updates. ClarisImpact 2.0 will ship with DataDraw templates for FileMaker Pro databases and Microsoft Excel spreadsheets to automate the process.

ClarisImpact 2.0: Easier, faster than drag-and-drop

ClarisImpact 2.0 works by using a 3-clicks and you're done approach to creating new business charts and diagrams. One mouse click for selecting the graphic the user wants to create, another click to choose a great-looking style, and a third click to complete the graphic. The user can then further edit or add data to the graphic.

ClarisImpact 2.0 provides an immense productivity boost from the drag and drop process offered by other business charting and diagraming applications. In those applications, the user must drag each component of a graphic (such as the boxes and connectors of an organizational chart) onto the page, one at a time. Editing and tweaking the graphic can mean starting over. With ClarisImpact, global editing is as simple as choosing a different style. Move, edit or delete a single chart component, and ClarisImpact automatically reconnects and spaces the graphic.

Claris challenge: Compare ClarisImpact and VISIO

As with all Claris products, usability testing played a big part in creating ClarisImpact. But Claris went even further, and tested ClarisImpact against current Windows category leader, VISIO 3.0. ClarisImpact 1.0 and VISIO 3.0 users, and non-users, were tested on both products. The results were clear: ClarisImpact 2.0 was overwhelmingly rated easiest to use by test subjects and was, by far, the most preferred application chosen by test subjects.

"We did the internal competitive usability testing to improve ClarisImpact and encourage others to compare ClarisImpact 2.0 against the competition," said
Chris Nalls, product manager for ClarisImpact. "We know we have a better solution."

The tasks were real world in nature, and included creating and editing organizational charts, project time lines and flow charts. A complete summary of the usability test results is available from Claris Public Relations .

A compatible add-on for suite users

ClarisImpact 2.0 is a perfect add-on to suite offerings, such as Microsoft Office. Its built-in XTND translation engine allows for importing most major application formats, including several versions of Microsoft Word, Excel, PowerPoint, WordPerfect and any text or tab and comma-separated data. And ClarisImpact 2.0 can import or export standard Windows and Macintosh graphics formats as well.

For companies or users who are not suite-based, ClarisImpact provides presentation functionality tightly integrated with the charting and diagraming features. For computer slide shows, over 50 transition effects such as fades, wipes and dissolves, a light table for easy rearranging of slides, an integrated outliner and great background templates for color, black and white and transparencies make communicating easy. A full-featured word processing environment makes it easy to create text-based documents with compelling charts and diagrams.

ClarisImpact 2.0 pricing and availability

ClarisImpact 2.0 is scheduled to ship in August for both Windows and Macintosh (and native for Power Macintosh) for a suggested retail price (SRP) of $129, with an anticipated street price around $99. Upgrades are $59; trade-ups from other graphics products, FileMaker Pro and ClarisWorks are $69.

Published Date: Feb 18, 2012

Adjusting Line Spacing by Changing Character Size

Typically, line spacing can only be adjusted in half line increments. If you want more control over line spacing you can use the font size of a space character to change the line spacing.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
In most programs line spacing can only be changed in half line increments. In ClarisWorks, line spacing can also be changed by manipulating the font size on each line. To change the line spacing this way, select the last space on a line and increase it's font size. As the font size is increased, the line spacing will increase to accommodate the larger font. Note that if a space character is chosen that is between two words but not at the end of the line, those two words will be separated differently than the other words so this is not recommended.

Note: This process should only be used after all text has been entered. Changes made to the text after font sizes have been changed could result in the space character, used to adjust the spacing, being moved to a different line. This would result in one of the lines not having the adjusted spacing.

If the program has a search and replace that also changes the font size and type, then a global search and replace can be done to change all spaces to the same font size and type. This will result in the same word spacing throughout the document. By changing the font being used to a narrower version of a larger font, the same thing can be done without changing the word spacing. The gap between the words with line spacing set to 1.5 is 0.16 inches verses character spacing set to 13 points space character is 0.14 inches.

Example: type some text using Helvetica 12 pt. with 1.5 line spacing. The text will look like this:

Sample Text for line spacing using space character font size. Sample Text for line spacing using space character font size. Sample Text for line spacing using space character font size.

Change the last space characters to 18 point Helvetica. The text will look like this:

Sample Text for line spacing using space character font size. Sample Text for line spacing using space character font size. Sample Text for line spacing using space character font size.

Text Clippings Do Not Work in ClarisWorks 4.0 For Macintosh

ClarisWorks 3.0 and 4.0 both have a limited ability to use the System 7.5 drag and drop technology.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
System 7.5 has a feature called drag and drop. If an application program supports the feature you can drag items instead of the more conventional copy and paste. For example, you can click on a picture in the 7.5 Scrapbook and drop it onto the Desktop (to create a picture clipping) or into a drag and drop aware application.

You can only drag items INTO ClarisWorks 3.0.

Text (clippings, or selected text from a drag and drop application) can be dropped in.
Pictures can be dropped in.
QuickTime movies can be dropped in.
Sounds cannot be dropped in.

ClarisWorks 3.0 and 4.0 both have a limited ability to use the system 7.5 drag and drop technology. In ClarisWorks 3.0 you can drop both a text clipping as well as a text document either into a WP document or into a text frame. However, in 4.0, there is no longer the ability to drop a text clipping into any environment. If you try to drop a text clipping, the text clipping simply returns to the desktop without inserting.

Text documents, QuickTime movies, and PICT's function the same way in both versions.

The following is a list of translation formats supported by ClarisImpact 2.0 for Windows:

Import (Open/Read)

Text-Based and Proprietary Formats:
ClarisWorks files (Up to but not including ClarisWorks 4.0)
ClarisWorks Templates (Up to but not including ClarisWorks 4.0)
Word for DOS
Word for Windows
WordPerfect
Lotus 123 (wks, wk1, wk2)
Excel
ASCII Text
DBF
DIF
RTF
SYLK

Graphics Formats:
CGM
Bitmap (bmp, dib, rle)
EPS
MacDraw Pro
Macintosh PICT (pct)
MacPaint
AVI
WMF
TIF
Paintbrush (pcc, pcx)

Export (Write/Save As)

Text-Based and Proprietary Formats:
Word for DOS
Word for Windows
WordPerfect
RTF
TXT

Graphics Formats:
CGM
WMF
PICT (pct)

Using Apple Display Cards With NTSC Monitors

I want to use the Display Card 4/8 or 8/24 with an NTSC Monitor. Do you know of any Apple or third-party cables? Or do you have pinout information that will help?

This article has been archived and is no longer updated by Apple.
The pinouts, sense-pin configuration, and data characteristics are listed below. After determining the pinouts of the monitor to which you plan to connect the video card, you can check the pinouts of Apple cables (posted on AppleLink) or third-party cables to see if one will work or if one must be made.

The Macintosh Display Card 8/24GC supports any display that meets one of the following specifications:

Sense pins			Hor x Vert Dot	Vert	Horiz
10	7	4	Display Pixels	Clock	Refrsh	Refrsh
0	0	1	Apple Portrait Display	640 x 870	57.2832	75	68.9
0	1	1	Apple Two-Page Monitor	1152 x 870	100	75	68.7
1	1	0	12" Apple Monochrome Monitor	640 x 480	30.24	66.7	35.0
1	1	0	13" AppleColor RGB Monitor	640 x 480	30.24	66.7	35.0
1	0	0	Interlaced Display	-	12.2727	-	-

0 - Grounded 1 - Not Connected
(Ground to pin 11, the Composite Sync and Vertical Sync Ground)

Note that sense pins 4, 7, and 10 are referred to as SENSE0, SENSE1, and SENSE2 in pinout tables for the video connectors.

None of the RasterOps or SuperMac 19-inch displays meets the above specifications. Based on this, we do not think that they will work properly.

Here are the pinouts for the Macintosh Display Card 8-24 GC:

Pin	Description
1	Red Video Ground
2	Red Video
3	Composite Sync
4	SENSE0
5	Green Video
6	Green Video Ground
7	SENSE1
8	Not Connected
9	Blue Video
10	SENSE2
11	Composite Sync and Vertical Sync Ground
12	Vertical Sync
13	Blue Video Ground
14	Horizontal Sync Ground
15	Horizontal Sync
Shell	Chassis Ground

SuperMac has announced two new monitors that work with the new Apple video cards. The first is called the "Color Two-Page Display" and the second monitor the "Platinum Two-Page Display."

Update for TelePort Gold II for Performa Fax/Modems

Information from Global Village Communications about updating software for your modem if you own a Performa.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Information from Global Village Communications about updating software for your modem if you own a Performa.

The following information comes direct from Global Village Communications:
If you have a Macintosh Performa 580CD, 631CD, 640CD, 5200CD or 6116CD computer and want to use the included modem, you should update the GlobalFax software that was installed on your hard drive. You can do this by using the application called "Performa GlobalFax 2.5.2 Update." The update is available from the Global Village BBS.

The Updater application will update a copy of version 2.5.2P of the Global Village Toolbox extension to version 2.5.2P1. This Updater application automatically checks for the proper software, so it will not affect any version of the software that doesn't need the update.

You should keep the update application. If you ever reinstall your GlobalFax 2.5.2P software from your CD, you will need to run the updater again.

ClickBook * BookMaker Corporation 1993, 1994, 1995

Hello

Thank you for purchasing the award winning ClickBook printing utility. We hope you'll enjoy using it and get hooked on printing easy-to-handle booklets!

How to print this document as a booklet

For detailed instructions, see the ClickBook help system (bring up ClickBook and click on the Help tab). In the Help Contents list, double-click on the Introduction to ClickBook topic and explore the topics.

After printing this document as a booklet, if the back sides of the sheets did not print correctly, double-click on the Solutions to Possible Problems topic and read the One side is double-exposed or upside-down! help topic.

Overview: What ClickBook does

ClickBook prints your documents -- from any Macintosh application in booklet form or other easy-to-handle formats like brochures. It prints multiple pages on both sides of a single sheet of paper. When you choose a booklet layout, ClickBook arranges the booklet pages on the printed sheets so that after you cut and bind the printout, you have a correctly paginated booklet.

You prepare your document as usual in your application program and choose print. After you click OK in the Print dialog box, ClickBook pops up.

In ClickBook, you select a layout and then click the Print button. That's all there is to it!

Recommendations for exploring ClickBook

To learn about any element (list or button, etc.) in ClickBook, you can use Balloon Help. ClickBook has a feature that allows you easily use Balloon Help. Just hold down the control and shift keys, and then point the cursor at the item that you want help for. (This also works for System 6.) This gives information such as what it does, and how to use it.
Try clicking on the layout illustration to cycle through all the available layouts.
Address book is one of our favorite layouts. It is handy for any information you'd like to carry with you in your wallet or a pocket.
Remember that your pages will shrink, so use large enough fonts to be readable in the layout you choose. For the Address book (folded) layout, we recommend at least a 20-point font for readability. We recommend using TrueType fonts, because they are fully scalable.

Note: If you have already prepared pages of the exact size you want them printed and therefore do not want ClickBook to shrink them, choose the No scaling option on the Modify Layout tab. See the Help topic Scaling for more information. (To find it, go to the Help tab and choose either Reference Information about... in the Help Contents or Scaling in the Help Index.)

About layouts

First, to discuss layouts clearly, we need a couple of definitions.
Page will mean a page according to your application's pagination of your document, which is the same as the resulting booklet page. It may end up smaller, but it will contain the same data.
Sheet will mean a sheet of paper, on which ClickBook may print several pages.

This section will be easiest to understand if you skim it once, and then reread it while looking at various layouts in the picture on the Main tab of ClickBook.

What is a layout? It is a detailed specification of how ClickBook must arrange the pages on the sheet of paper. Some of the essential details are

whether the sheet orientation is portrait or landscape, how many pages are printed across and down on one sheet, and whether to print single- or double-sided. Fine-tuning settings are also part of each layout, such as sizes of margins and binding space.

Each layout also specifies the pagination method to be used, which ClickBook must match to how you will bind the finished book. There are four general binding schemes. We call the corresponding layout types cut book, folded book, tri-fold and tiled.

The tiled layouts are designed for printing multiple pages on a sheet but not cutting the sheets. Folded books are designed for folding between facing pages, and stapling. Other methods of binding, which require cutting between facing pages, require cut book layouts. Tri-folds are single sheet brochures that are folded in thirds. Single-sided book layouts are designed for you to photocopy as double-sided, resulting in a correctly paginated double-sided booklet or brochure.

Sample files

We have included various sample files in this release for the following applications. The files are:

```
Sample Files            (Claris): version:

ClickBook ReadMe        (ClarisWorks) (ClarisWorks 4.0)
Calendar                (ClarisWorks 4.0)
Wine County             (ClarisWorks 4.0)
Industrial Davis Group  (ClarisWorks 4.0)

Sample Files            (Microsoft):   version:

ClickBook ReadMe        (Word)    (Word 4.2)
Wine County             (Word 4.2)
Industrial Davis Group  (Excel 2.0)
```

If you have any of the above applications you might want to try printing some of the sample files with ClickBook!

Note: you must have the version listed above (or later). Earlier versions use different file formats.

ClickBook's Customized Page Setup commands in popular applications
We have included the capability for a document to remember that it is a ClickBook document. If your application correctly supports Page Setup, and most applications do, then you can turn on ClickBook for specific documents. Just choose Page Setup in your application's File menu. ClickBook will add a checkbox at the bottom of the dialog. Choose to use ClickBook. If you then save your document, this setting will be saved with the document.

If your application doesn't correctly support Page Setup, all is not lost. Since there are some applications that do not, we have included a ClickBook Setup Control Panel. With this Control Panel, you can choose to always use ClickBook, never use ClickBook, or to use ClickBook through Page Setup. Just choose the always option, and then print from your application. (Do not forget to set the Control Panel back.)

Uninstalling ClickBook
Uninstalling ClickBook is a simple process. Drag the following applications and files into the trash.

1. The control panel ClickBook Setup found in the Control Panels folder.
2. The folder ClickBook Prefs Folder found in the Preferences folder (which is in the System folder) for System 7 and later. For System 6, you will find it in the System folder.
3. ClickBook (the application), which is generally located on your hard drive in the ClickBook folder.

Once you have emptied the Trash and restarted your Macintosh, ClickBook will be completely removed from your system.
Late-Breaking News
The environment in which ClickBook runs is constantly changing, but we are trying our best to keep up...

Duplex Printers:
ClickBook works great with duplexing printers (printers that can automatically print on both sides of a piece of paper). However, there is no way for ClickBook to automatically know that you have such a printer. Even if it could tell, ClickBook still could not tell if you are choosing to use the printer's duplexing capabilities. Therefore you need to specifically tell ClickBook that you want to print duplex.

To do this, go to the Modify Layout tab and choose Duplex. ClickBook now thinks that this layout is a duplex layout. You still need to tell the printer of your intention to print duplex. To do this, click the Page Setup button on the Modify Layout screen. You will be presented with two dialogs, Page Setup and Print. These dialogs will vary, according to your printer and print driver. However, somewhere in these dialogs will be an item that allows you to put your printer in duplex mode. Choose that and then click on Save in Modify Layout.

Print Driver incompatibilities

TA43293_ClickBook_Read_Me_File.pdf

There are some print drivers out there that cause ClickBook some problems. Here is some information on print drivers we know we have some problems with right now.

StyleWriter II drivers, before 1.2. (To check the version number of your driver, choose Page Setup from some application. The driver version number will be displayed near the upper-left corner.) If you have a driver older than 1.2, you may experience some clipping problems (portions of a page missing). The older versions of the driver do not handle clipping correctly in certain scaling situations. ClickBook does a lot of scaling, so this causes the problem to surface more often than normal.

LaserWriter 8 drivers. There are also some clipping problems, and as with the StyleWriter driver, they are due to scaling. (To check the version number of your driver, choose Page Setup from some application. The driver version number will be displayed near the upper-left corner.) If you are experiencing problems, try using an older LaserWriter 7.x.x driver. As of this document, LaserWriter 8.1.2 was still causing us some problems. Hopefully, future versions of the LaserWriter 8 driver will address this. (It seems that we work just fine with any flavor of LaserWriter 7 driver.)

ClarisWorks 4.0 Apple Event Dictionary (All)

If you use AppleScript, here is the AETE Resource listing ?? or Apple Event Dictionary ?? for ClarisWorks 4.0. Also a brief explanation of popular AppleScript terminology is included for your reference.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The Macintosh operating system (versions System 7.1 and later) has a system-level extension called AppleScript. AppleScript is an automation tool, and is a method by which you can control the behavior and functionality of specific programs. Application developers make their programs AppleScript-Savvy by adding an "AETE Resource." The AETE Resource for an application tells AppleScript what kinds of things it can do in that particular application.

There are three general levels of compatibility with Apple System resources like AppleScript: "Savvy," "Aware," and "Incompatible." If an application is described as AppleScript Savvy, it means that it has an "AETE Resource," which is the list of commands, or "Dictionary" for that application. It serves as the list of commands that AppleScript can execute in that program. If an application is described as AppleScript Aware, it means that it is fully compatible with AppleScript, and although it does not have an AETE Resource, it may support AppleScript or Apple events in a very limited way. If an application is described as being incompatible with AppleScript, it means that for some reason that program may exhibit crashes or other undesirable behavior when AppleScript is installed.

AppleScript-savvy applications like ClarisWorks 4.0 are described in three ways: "Scriptable," "Recordable," and "Attachable." ClarisWorks 4.0 contains an AETE Resource, so it is AppleScript Savvy, but it is only Scriptable, meaning that its commands must be accessed through scripting applications like Frontier, AppleScript, or even FileMaker Pro.

For an application to be Recordable, that application has to be able to send Apple events to describe what it's doing as it does things - those events can be stored by AppleScript as scripts, because AppleScript was able to "watch" them being done in the application where they were executed. Recordable applications are relatively uncommon due to the amount of programming that is required. Attachable applications allow you to attach scripts to menu selections, buttons, or other controls within the Attachable application itself.

Here is how the ClarisWorks 4.0 event dictionary appears in the AppleScript Script Editor.

Required Suite: Terms that every application should support

open: Open the specified object(s)
open alias -- list of objects to open

print: Print the specified object(s)
print alias -- list of objects to print

quit: Quit application
quit

run: Sent to an application when it is double-clicked
run

Standard Suite Subset: Standard Definitions

close: Close an object
close item -- the object to close
[saving yes/no/ask] -- Specifies whether or not changes should be saved before closing
[saving in alias] -- the file in which to save the object
[as type class] -- the type of file in which to save the document
[using string] -- the name of the XTND translator to use to save the document

open: Open the specified object(s)
open alias -- list of objects to open
[using string] -- the name of the XTND translator to use to open the file
[as DR/WP/SS/DB/PT/CM] -- the type of document as which to open the file

print: Print the specified object(s)
print alias -- list of objects to print
[merge alias] -- list of database files to merge
[one copy boolean] -- print one copy without displaying the print dialog?

quit: Quit application
quit
[saving yes/no/ask] -- specifies whether to save currently open documents

save: Save a document
save document -- the document to save
[in alias] -- the file in which to save the document
[as type class] -- the type of file in which to save the document
[using string] -- the name of the XTND translator to use to save the document

Class application: An application program
Elements:
document by numeric index, by name, as a range of elements
window by numeric index, by name, as a range of elements
Properties:
current slide slide [r/o] -- the current slide being displayed in a slide show

Class document: an open document

Class window: a window

Miscellaneous Standards Subset: Miscellaneous definitions

cut: Cut the current selection to the clipboard
cut

copy: Copy the current selection to the clipboard
copy

paste: Paste from the clipboard to the current selection
paste

do script: Execute the specified macro
do script anything -- the name of the macro to run

do menu: select a menu item and perform its action
do menu menu item -- the menu item to be selected

Class menu: A menu
Plural form:
menus
Elements:
menu item by numeric index, by name, as a range of elements
Properties:
name string [r/o] -- the name of the menu
ID small integer [r/o] -- the menuÕs ID

Class menu item: A menu item
Plural form:
menu items
Properties:
name string [r/o] -- the name of the menu
index integer [r/o] -- the menu item number

ClarisWorks Suite: Definitions specific to ClarisWorks

start slides: Start the slideshow for the current document
start slides

stop slides: Stop the slideshow, returning to the normal application state
stop slides

display: Go to a specific slide
display slide -- the slide to be displayed

Class slide: A slide which may be displayed in the slide show
Plural form:
slides

Apple Modem Tool Tips

This document is included in the Support Files folder with Claris Emailer.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
This document describes some tips for using the Apple Modem Tool. The Apple Modem Tool is shipped with Claris Emailer for use with America Online, and CompuServe connections via modems.

Updating the Apple Modem Tools Prefs file

The configurations for modems are stored in the Apple Modem Tool Prefs file which is stored in the Preferences folder in the System Folder. The file that normally accompanies the Apple Modem Tool has a limited set of modems. The Claris Emailer Installer installs a copy of the file with a more extensive list of files.

If, during the initial installation of Claris Emailer, you did not install the Apple Modem Tools Prefs, you can easily install the file separately.

1. Launch the Claris Emailer Installer.

2. Click Continue until you see the Installer window.

3. Select Custom Install from the pop-up menu in the upper left of the window.

4. Select Apple Modem Tool Prefs from the list.

5. Click the Install button.

6. If asked to Replace or Skip, click Replace to install the new Apple Modem Tool Prefs.

Adding or modifying a modem configuration in the Modem pop-up menu

You can add new entries to the Modem pop-up menu or modify existing entries. This allows you to create a set up for your modem that meets your specific needs.

1. In Claris Emailer, select a service that uses the Apple Comm Toolbox: either America Online or CompuServe.

2. Click the Edit button to open the Service entry.

3. Click the Configure button to display the Apple Modem Tool configuration dialog.

4. Choose Modify This Menu from the Modem pop-up menu in the Modem Options area of the dialog box for the Apple Modem Tool.

5. If modifying an existing entry, click on the modem that you would like to modify.

If you are creating a new modem entry, click on the modem that is most similar to the modem that you would like to add. Selecting the modem first creates a duplicate of that modem configuration.

6. Click the Add button to add a new configuration or click the Modify button to modify an existing entry.

7. Make the changes to the setup.

8. Click Done to save your changes and return to the Connection Settings dialog box.

9. Choose the modem definition that matches your modem from the Modem pop-up menu.

10. Click OK to save this configuration.

If your modem is not listed in the Modem pop-up menu, consider contacting the modem manufacturer to see if they have a setup file for the Apple Modem Tool.

Importing new modem configurations into the Modem pop-up menu

You can import entries into the Modem pop-up menu. Files containing modem configurations are sometimes available on online services and

directly from the modem manufacturers. Such files often have the string AMT (Apple Modem Tool) within the file name.

1. In Claris Emailer, select a service that uses the Apple Comm Toolbox: either America Online or CompuServe.

2. Click the Edit button to open the Service entry.

3. Click the Configure button to display the Apple Modem Tool configuration dialog.

4. Choose Modify This Menu from the Modem pop-up menu in the Modem Options area of the dialog box for the Apple Modem Tool.

5. To import the appropriate modem definition for your fax/modem, click the Import button and locate the modem definition file.

Once you have imported the modem definitions file, the names of the imported modem definitions appear in the list of modem definitions.

6. Click Done to save your changes and return to the Connection Settings dialog box.

7. Choose the modem definition that matches your modem from the Modem pop-up menu.

8. Click OK to save the configuration.

What to do if your modem is not listed in the list of modems

You can often use another modem type successfully. Try the following:

1. Pick a similar model. For example, if you own XYZ Modem 28.8 try XYZ Modem 14.4.

2. In the Modem pop-up, try each of the following:

Generic 2400
Generic MNP/V.32
Hayes-Compatible Modem

The above settings work with most modems but you may not get optimum performance.

3. Contact the modem manufacturer to see if they have an Apple Modem Tool setup that you can import and then use.

4. If you are comfortable configuring modem init strings, create a custom setup for your modem. Use the Custom menu item in the Modem pop-up menu.

Making the current configuration the default for all new configurations

You can set a default configuration for the Apple Modem Tool. After you have set a default configuration, each new configuration uses the default.

To make a modem configuration the default for all new connections, hold down the Option key while clicking the OK button in the Apple Modem Tool configuration.

Turning off the modem speaker

You can turn off the modem speaker by adding M0 (zero) to the modem initialization string for your modem. This takes a number of steps to set up but you only need to do it once.

Follow these steps to turn off the modem speaker:

1. Select a service that uses the Macintosh Comm Toolbox, such as America Online or CompuServe.

2. Open the Apple Modem Tool by clicking the Configure button.

3. Select the Modem pop-up menu and choose Modify this menu at the bottom of the menu.

4. Select your modem and click the Modify button to modify the modem settings. Or click the Add button to create a new copy of your modem settings.

5. Add M0 (zero) to the end of the Initialization string.

6. Save the changes.

You can use the same steps to change the volume of the speaker. Instead of using M0 (zero), use M1, M2, or M3 with M1 being the quietest and M3 being the loudest.

Claris Emailer: Frequently Asked Questions (Address Book)

This is a portion of the FAQ that is included in the Support Files folder of Claris Emailer.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

- Can Claris Emailer import my Eudora, AOL, Navigator, and CIS Information Manager address books?

Yes. See the Claris Emailer User's Guide for more information on importing address books.

- How do I add someone to my address book from an incoming message?

Use the small + (plus) button next to the sender's name.

- I love using the + to add an address to the Address Book. Sometimes there is an address in the text of the message that I would like to add. Can I do that?

Yes. If you have Macintosh Drag and Drop installed, you can drag addresses from the body of any Claris Emailer message into the Address Book or onto the Address Book tab. Doing so creates a new entry in the Address Book.

The following address formats are supported:

<mailto: "John Doe" johndoe@host.com>
John Doe, johndoe@host.com
johndoe@host.com

Note that the address must be the full Internet address which contains the @ symbol.

- Why didn't the individual's address change in the group when I changed their address?

The addresses in groups are not connected to the addresses in the address book. To update a group address, you should edit the address within the group address.

- Where are the group addresses?

Group addresses are always at the bottom of the Address Book list.

- Can I put address book groups within groups?

No. Each entry in an address book group must be an address.

- Why did my address book destinations change?

The destinations are saved in a file called Destinations. If you move or delete this file, Claris Emailer creates a new one. The new one may not have the same entries as the one that was moved and your address book entries will need to be updated.

- Where do I put a company name in the Address Book?

You can use the Description field in the Address Book for anything including the company name.

- How do I find an address of a person on an online service?

To look up an address, you need to use the software that came from your online service. The best way to find someone's email address is to ask them for it. You can often save time and frustration this way. If you ask them to send you mail, you can easily add their address to your Claris Emailer address book by simply clicking on the + button next to their address on the incoming message.

- Can I put a space in an AOL address? For example, could I address a message to J Smith at AOL?

Spaces are optional in AOL screen names. For example, a screen name Jane Doe could also be written JaneDoe. When you send a message to someone at AOL via the Internet, the address cannot contain a space. Claris Emailer properly removes any spaces when sending the message.

- Does it matter if the address is in uppercase or lowercase characters? For example, does JaneDoe@host.com work as well as janedoe@host.com?

You can use either uppercase or lowercase characters in an address. None of the online services or the Internet are case sensitive.

- Why did my imported address book not have names?

Address books used by other email programs often do not store names. You need to edit these addresses after importing.

- I want to export my Address Book but groups are not exported. What can I do to save the groups?

Groups are not exported because there is not a standard for importing groups into other programs. If you have Macintosh Drag and Drop, you can easily save groups and later add them to the Address Book.

If your Finder supports Desktop Clippings, select the group and drag it to the Desktop to create a Desktop Clipping.

If your Finder does not support Desktop Clippings, select the group and drag it to any editor that supports Drag and Drop, such as SimpleText or even an outgoing Claris Emailer message.

To put a saved group back in the Address book, select the Clipping file (or list of addresses if saved as text), and drag and drop it to the Address Book or Address Book tab. You will need to enter a name and description.

- When I export my Address Book, what happens to the default address for each address book entry?

The default entry is exported as the first address. This makes importing the exported address book very easy as the first entry is used as the default address.

TA43297_DOS_Version_and_the_Language_Card_(TIL00565).pdf

DOS: Version 3.3 and the Language Card

At power up, DOS 3.3 looks at location $E000, both on the motherboard and on the firmware card, to check which version of BASIC is available. If a Language card is present, DOS tries to jump into some random information on the card.

This article has been archived and is no longer updated by Apple.

This jump is prevented by a machinge language routine that places a $00 at $E000 on the Language card during booting. This routine is stored on the DOS diskette at track 0, sector 9, starting at byte $D3.

Claris Draw: Multiple Duplication Offset Doesn‘t Work Properly

If the duplication offset doesn't work properly, it could mean that Layer 1 in your drawing is locked.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
It is often useful in ClarisDraw to be able to create a number of identical objects offset from each other in a regular way. For example, if you want a row of 1" squares separated from each other by exactly 1/4", you can create one square, select it, and choose Duplicate under the Edit Menu.

While the duplicate square is selected, you drag it into the correct offset position and duplicate it again. The second duplicate is now offset from the first by exactly the same amount and in the same direction as the first duplicate is offset from the original. If you continue duplicating the object without deselecting it, each new object is automatically offset by the correct amount and in the correct direction.

However, if Layer 1 is locked, succeeding objects do not automatically offset correctly.

To unlock Layer 1, choose <Layer Manager...> from the Layer pop-up menu found near the bottom left corner of your document window. Click on Layer 1 in the list appearing in the Layer Manager window, then uncheck the checkbox labeled "Locked."

Claris Development is aware of this issue.

The Rules of Email

This article by Guy Kawasaki was originally published in MacWeek and is reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Guy helps you brush up on your email etiquette

Much to the relief of my wife, I no longer deny that I'm obsessed with email. (She views this admission as the first step to a cure.) I receive fifty messages per day and send 100. When I check any of the five (down from seven) services that I use, and find that I don't have email, I get depressed.

My passion for email has gotten so bad that I started a company to create an email product--there is no greater inspiration for starting a company than wanting to use its product. And there is no greater inspiration for writing than to communicate information that directly impacts your life, so all you emailers out there, please observe these rules of email etiquette.

Files: Just Say No!

#1) Don't send a file unless the recipient wants it and expects it. I've gotten three-paragraph letters that were sent as files with a cover message that said, 'Please read attached letter.' Only bozos send files when they don't need to. They assume that files will be properly downloaded and that recipients have the applications to open them. Then there's the assumption that recipients want to see the GIF file of a bozo's face or a bozo's resume in QuarkXPress using Giovanni Book.

#2) Don't explain your life story--get to the bottom-line reason you're writing. Many messages start off with four long paragraphs explaining the sender's life history, starting with their Apgar score. For goodness sake, show some self confidence. You don't need to explain who you are or justify why you're writing to elicit a response. If the recipient is going to answer, he's going to answer. If not, life goes on.

#3) Describe the topic of your message in the subject area. This helps both you and your recipient. When your recipients have inboxes full of messages, they are going to make the decision about which messages to read and answer based on who sent the message and what the subject is. (In my case, for example, 'Love your books!' will always work.) The subject area is indispensable for the recipient to find a message that was filed away.

ALL CAPS: Just Say No!

#4) Never write in ALL CAPS. Text in all caps is considered screaming by savvy email users. It's okay to use for emphasis in rare instances of passion, but not for entire messages. An alternative is to put an underscore or asterisk before and after the text you wish to _emphasize_. Even if all caps wasn't considered screaming, it's simply harder, and therefore tiresome, to read.

#5) Quote the text from the incoming message in a reply. Hours, days, or even weeks can pass between the time a message is sent and a reply received. In that time, people can easily forget what they asked. For example, incoming message: 'How's the new vacuum cleaner? Answer, a few weeks later: 'It really sucks.' The convention is to place a '>' symbol or two in front of the question or comment in order to signal that this is the issue that you're addressing.

#6) Use carbon copies and blind carbon copies sparingly. Hardly anyone who gets a carbon copy or blind carbon copy message wants it. The sender thinks he's keeping people 'in the loop,' covering his assets, or intimidating someone. I often get a carbon copy of messages sent to Mike Spindler. Senders must think that Mike is going to be intimidated by the fact that I got the message too, that I will contact Mike on their behalf, or that Mike cares what I think. Dream on.

Chain Letters: Just Say No!

#7) Never create or forward 'chain-letter' email. There is nothing funny, cute, or redeeming about this practice. People who do this should lose their email accounts. However, it is okay to send copies of interesting messages and postings--for example, the hilarious press release about Microsoft buying the Roman Catholic Church--to people you know.

#8) Practice the 5 to 1 rule: for every five words in an incoming message, your reply should have one. Someone once told me that my emails are 'curt but complete.' He was trying to insult me, but I took it as praise. A lot of email is venting of emotions. It's not necessary or prudent to respond to each and every point, arguing and commenting tit for tat. A simple, 'Thanks for your comments.' is sufficient.

#9) Use signatures sparingly. Signatures are the text that people place at the end of messages. They contain information such as phone and fax numbers and company names. Some people, unfortunately, go overboard and create elaborate signatures with poetry, quotes, and ASCII art. Not that many people want to see the ASCII art rendition of your dog, so simplify your signature or don't use one at all.

The Golden Rule: Just Say So!

It's impossible to cover every situation in a column, so always remember the Golden Rule of Email: Message unto others as you would have them message unto you. If you want to be graded on your email etiquette, send me a message at MacWay@aol.com. I will tell you in advance, however, that messages in all caps, with file attachments, or with long signatures, will fail.

Support Policy for Files Created in Beta Version of ClarisWorks

Files created in beta versions of ClarisWorks 4.0 prior to version d50 cannot be opened in versions later than d50, including the shipping version.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
A number of CSA members received a CD from Claris in early May of 1995 which contained a beta version of ClarisWorks 4.0. Due to factors encountered during the development cycle, files created or saved in this version of ClarisWorks 4.0 cannot be opened in later versions of ClarisWorks 4.0, including the certified, shipping version.

This software was distributed explicitly for evaluation purposes only and was accompanied by a letter (see below) which states: "As with any pre-release software, be sure to work with backup copies of your files as it is still possible to damage or lose data through program error. Please note that the software comes 'as is' and no technical support is provided."

As stated above, due to issues in version-to-version conversion between the various beta releases, Claris Technical Support is unable to convert any files created or saved in beta versions of ClarisWorks 4.0 to a format supported by the current shipping version.

CONFIDENTIAL PRE-RELEASED SOFTWARE

May 3, 1995

Dear ClarisWorks for Macintosh Evaluator:

Enclosed you will find a confidential pre-released version of ClarisWorks 4.0 for Macintosh, for your evaluation. As a CSA Member, you indicated an expert level in using ClarisWorks, and this software is being provided to you to view and evaluate the latest version of the best selling integrated application for the Macintosh.

This software will not be publicly announced until later this month, and under your CSA nondisclosure agreement, along with the enclosed license agreement you agree to become bound by the terms of this license.

This version of ClarisWorks has over 100 new features to help you be even more productive with your Macintosh. This package contains:
* Pre-release software
* Draft EvaluatorÕs Guide
* Quick Reference for key new features
* Evaluation survey
* Electronic help is also included in this version.

To install the software please follow these directions:
* First, please make a backup copy of the Claris folder (located in the System folder) since ClarisWorks 4.0 will add new items to your current Claris folder that will not currently work with ClarisWorks 3.0. We recommend that you name it ÔBackup ClarisÕ. Once you go back to using ClarisWorks 3.0, you should throw away the Claris folder and rename the backup copy to ÔClarisÕ.

* For CD-ROM installation: Place the CD into your CD-ROM drive. Double click on the folder named Disk 1. Double-click the Install ClarisWorks icon. Choose either the Easy Install or Custom Install and select the appropriate hard drive for installation.
*Please note that there are some placeholder items such as the README that will be in the final version, but are not included in this pre-release version.

As with any pre-release software, be sure to work with backup copies of your files as it is still possible to damage or lose data through program error. Please note that the software comes 'as is' and no technical support is provided.

Thank you for your participation in the evaluation program. Your help and input are greatly appreciated and always welcomed.

The ClarisWorks Team

About ClarisWorks 4.0 Mac/Windows, Product Fact Sheet

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

ClarisWorks 4.0 Fact Sheet
for Macintosh & Windows

Product Description:
ClarisWorks 4.0 is the smartest, all-in-one choice for business, education, and home.

The best-selling product for the Macintosh with almost four million users worldwide, ClarisWorks 4.0 provides users with powerful, all-in-one design, expert assistance, and time-saving automation features in a single, easy-to-use program. With full-featured word-processing, spreadsheet, database, graphics, and presentation capabilities, ClarisWorks 4.0 customers can create everything they need from memos to presentations, customer lists to mailing labels, letters to college term papers, flyers to invitations, home budgets to balance sheets, and family newsletters to business reports.

ClarisWorks 4.0 adds over 100 new features while still retaining an exceptionally compact size, providing lightning fast speed while requiring minimal space on a hard drive. And itÕs the only all-in-one program with Windows and Macintosh versions that are 100% compatible - identical user interface with no translation needed when sharing files across platforms.

ClarisWorks Customers:
* Small Business/Home Office Users will save time and money with only one application to buy and learn. ClarisWorks is the only general productivity tool they will need for creating letters, reports, invoices, presentations, proposals, mailing labels, customer lists, and newsletters.
* Home Users will benefit from the all-in-one design, with one application providing all the tools needed for Mom's home budget management, Dad's family newsletter, the kids' homework, and Grandma's recipe filing. The whole family will appreciate the step-by-step guidance and expert advice provided by the ClarisWorks Assistants.
* K-12 Educators will appreciate the excellent performance of ClarisWorks on the low-end Macintosh computers used most frequently in the classroom. And ClarisWorks in the Classroom and ClarisWorks for Teachers, popular add-on teaching aides available separately from Claris, make ClarisWorks the all-in-one favorite among teachers.
* Higher Education Students, Faculty and Administrators will use ClarisWorks as a one-stop productivity tool. And its outlining, full-strength word processor, end notes, research database and presentation capabilities make term paper publishing quick and easy.

* Mobile Professionals will benefit from the program's small size and fast performance. Its exclusive cross-platform compatibility allows users to easily share files with both Windows and Macintosh computers back in the office, and translate files from most other popular software programs.

Key Features and Benefits: Powerful, All-In-One Design

ClarisWorks 4.0 provides users with powerful, full-featured word-processing, spreadsheet, database, graphics, and presentation capabilities, in a single, easy-to-use program. Its seamless integration and all-in-one design allows users to switch from word-processing to spreadsheet capabilities with one click of the mouse, providing instant access to all of the program's features and the ability to combine words, graphs, tables, photo images -- and even video -- on a single page. ClarisWorks 4.0 provides all the tools users need to create everything from memos to presentations, customer lists to mailing labels, letters to college term papers, flyers to invitations, and home budgets to family newsletters.

From powerful new word processing capabilities like sections and stylesheets to enhanced database reporting, ClarisWorks 4.0 has the most robust set of features among all other Works programs making it the ideal choice for simple or complex tasks.

Expert Assistance and Time-Saving Automation
Demonstrably easy to install and use, ClarisWorks 4.0 offers step-by-step guidance and expert advice, to help users get their work done quickly. The ClarisWorks Assistants offer detailed, friendly help with layout, design and content in the automated creation of newsletters, presentations, tables, envelopes, labels, footnotes, address books and calendars.

ClarisWorks 4.0 includes three new Assistants:
* Mail Label
* Home Finance
* Certificate

ClarisWorks 4.0 also offers users many time-saving, automated features:
* 30 Stationary or sample templates for the creation of memos, letters, family address books, movie or music collection cataloging and more.
* Shortcuts provide push button access to over 170 of the most commonly used functions.

* The new ExpressStyle feature instantly formats text, paragraph, graphic, outline, and table styles. Both pre-defined and custom styles are

available; all styles are 100% editable. Users can easily create and edit styles from one palette in the same way whether itÕs tables, graphs, outlines or text.
* The new ReadyArt Libraries allow users to store and organize hundreds of frequently-used clip art images, including both ready-made clip art and custom art such as business logos.
* The new FastReport feature automates searching, sorting, and reporting of frequently used data, saving time by allowing users to create and save custom reports, sorts, and searches.

The Compact, Fast & Friendly Office Alternative
ClarisWorks 4.0 is a compact and less expensive alternative to the software suites. ClarisWorks 4.0 provides users with just the right set of features, no bloated software stuffed with features users will never need. ClarisWorks 4.0 provides lightning fast performance while requiring minimal RAM and hard disk space. It save times and money with only one application to buy and learn. AND at well under half the price of the Microsoft Office, ClarisWorks 4.0 gives users the best software value.

Uniquely Compatible Across Platforms and Products
ClarisWorks 4.0 is the only Works program that is 100% cross-platform compatible with the same interface and file format for both Windows and Macintosh. Users can easily share files created on their Macintosh at home or with the Windows PC in the office without needing to translate. And ClarisWorks users can also share files with other popular stand alone programs for DOS, Windows and Macintosh.

New Features in ClarisWorks 4.0:
Expert Assistance & Automation
* 3 New Assistants (11 total): Mail Label, Home Finance and Certificate
* ExpressStyle for formatting text, paragraphs, outlines, tables and graphics
* ReadyArt Libraries for storing hundreds of clip art images or text
* FastReport for quick database searching, sorting or custom reporting
Word Processing
* Integrated outlining in any paragraph or document
* Sections for professional-looking documents
* Multiple headers & footers
* ExpressStyle pop-up in text ruler
* Left/right facing pages
* End notes

* Mail merge preview

* New font styles (superior, inferior, double underline)
Database
* Spreadsheet-like List View for easy database viewing and manipulation
* New field types (smart name, radio buttons, check boxes, pop-up menu, serial number, value list, record info.)
* FastReport toolbar buttons for layouts, searches, sorts and reports
Spreadsheet
* Fill special (month, day, year, time, quarter, etc.)
* Cell-shading (colors & patterns)
Graphics
* Free rotation of any object (by 1 degree increments)
* 500 pieces of clip art already stored in ReadyArt Libraries
Internet Authoring
* HTML (Hypertext Mark-Up Language) translator for creation of documents for the Internet or Home Page on the World Wide Web

Mac OS Support
* AppleScript & AppleEvents support for batch printing, converting multiple documents, and sample scripts for mail merge
* WorldScript support for multi-lingual documents
Windows 95 Ready
* 32-bit application
* Windows 95 look & feel
* Status bar
* Long-format file naming
* Right mouse button support

System Requirements:

Macintosh and Power Macintosh
* Macintosh computer with 68020 processor or higher
* Requires a hard disk and 4 MB RAM
* System 7.0 or higher
Windows

* PC with any 386 or higher processor
* Requires a hard disk drive and 8 MB RAM
* VGA or better video
* Windows 95

ClarisWorks: Random Numbers Won‘t Sort Correctly (SS)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When sorting a range of cells with the RAND() function that contain random numbers, those cells may appear not to sort correctly. In fact, the cells do sort correctly. However, after the cells are sorted, the spreadsheet recalculates a new set of random numbers, which will be unsorted.

To sort random numbers, first turn Auto Calc off in the Calculate menu, then Sort.

If you manually recalculate, the entire range of random number cells will be recalculated, resulting in a new set of unsorted numbers. To retain the original random numbers, you can copy them, then Paste Special to an adjacent blank column/row of cells.

Version Information for XTND Translators in ClarisWorks 3.0 and 4.0

Some of the XTND translators installed by ClarisWorks 4.0 are updated versions from those installed by ClarisWorks 3.0.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

The set of XTND translators installed by ClarisWorks 4.0 contain some updated translators from previous versions of ClarisWorks. Below is an itemized listing of the XTND translators ?? and their version numbers ?? for both ClarisWorks 3.0 and 4.0. An asterisk (*) preceding the translator name indicates an updated translator.

Name of Translator	Translator Version Number	Date Last Modified
Acta 3.0	ClarisWorks 3 installs 1.0	Wed Jun 3, 1992, 11:30 AM
	not used in ClarisWorks 4 (see Dyno NotePad & Acta 3.0)	
AppleWorks	1.0v2	Thu Mar 10, 1994, 4:00 PM

Basic PC Memory Management

The mystery of memory is explained in this two-part article on memory issues that directly affect the operation of Claris applications. Part one deals exclusively with Windows memory issues.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Do the words "general protection fault" or "application error" put fear in your heart? Does the thought of doing any customizing or editing in MS-DOS fill you with fear? Do you feel you know "just enough to be dangerous" when it comes to handling your Windows computer?

Errors you may encounter on your Windows computer often have to do with the memory used by your computer to run your applications. As you will see, memory is an organized structure, and not mysterious.

Disk storage and RAM

There are two ways that data can be stored on a computer. First, it helps to know that data is anything that you put on your computer. Whether it is an application or a document you just saved, it is all data. The first method of storing data is known as temporary storage, most commonly referred to as RAM (Random Access Memory). This type of memory holds the data until you turn off your computer. The only way to ensure that a document or file in which you were working does not vanish when your computer is turned off is to save the file(s) before powering down your computer.

The second type of storage is known as permanent. There are many types of storage devices but they generally fall into two categories: hard disk and floppy disk. The data is read from and written to these permanent types of storage devices. A hard disk (also known as fixed disk) is usually installed inside the computer and can hold large amounts of data. A floppy disk is removable and can hold limited amounts of data.

Unit of measurement

A bit (short for binary digit) is the smallest unit of information in the binary code. A bundle of eight bits forms what is called a byte. A byte can represent 256 different combinations of zeros and ones (binary code) which form 127 different symbols such as letters, numbers, punctuation marks and special codes. The naming convention used for describing large increments of data includes Kilobyte (K), Megabyte (MB), Gigabyte (GB), and Terabyte (TB). The metric prefixes denote now many bytes of information. The prefix "kilo" means one thousand, "mega" equals one million, "giga" equals one billion and "tera" means a whopping one trillion! A kilobyte is actually slightly larger than one thousand bytes. It actually is 1,024 bytes. Thus, the megabyte is actually 1,048,576 bytes.

Memory on the PC

Memory on the PC is a variation of the theme described here. A PC divides its memory into separate blocks, each block being used for different things. You can picture the memory of a PC as a single region, with different types of memory layered on top of each other. (See Figure 1.)

Conventional memory

The first layer of memory on every PC running DOS is base or conventional memory. The conventional memory found on all PCs is the first 640 kilobytes of RAM, which can accommodate up to 640K of drivers. While most Windows applications are able to access other types of memory, this block is necessary because a number of programs use a small amount of base memory just to boot up. Also, there are still some programs, primarily DOS applications, which access conventional memory only.

Upper memory block

You can think of the memory directly above base memory as a small block known as upper, or high, memory; this is the 384K that, together with base memory totals one megabyte (640K + 384K = 1024K = 1 megabyte). (See Figure 1.) Because the amount of high memory is finite, MS-DOS can load only as many drivers and programs as will fit into that 384K memory range.

High memory and Extended Memory

The first 64K of Extended Memory is called High memory. In order to utilize any range of memory, high, extended or expanded, a memory manager must be used. Two files provided with MS-DOS and Windows, when used together, create an effective memory manager. HIMEM.SYS is required for Windows and SMARTDRV.EXE to run. In addition, EMM386.EXE is required for use of the memory area above 640K. The required syntax, as it would appear in the
CONFIG.SYS file is shown in the following examples. Since MS-DOS 6.0 (and higher) has the most current versions of EMM386.EXE and HIMEM.SYS, it is used throughout the syntax examples here. So, when using MS-DOS 6.0 (or higher) the commands are:

```
DEVICE=C:\\DOS\\HIMEM.SYS
DEVICE=C:\\DOS\\EMM386.EXE NOEMS
DOS=HIGH,UMB
```

Please note: When using MS-DOS 5.0, use the HIMEM.SYS and EMM386.EXE which are provided with Windows 3.1 (and higher). This means the lines in the CONFIG.SYS read as follows:

DEVICE=C:\\WINDOWS\\HIMEM.SYS
DEVICE=C:\\WINDOWS\\EMM386.EXE NOEMS
DOS=HIGH,UMB

Do-it-yourself PC memory
Even in the best of all possible worlds, this can happen to you: you're ready to go to work on that report that's due next week. You turn on your computer, load Windows, load your application and you see an "Out of memory" message on the screen. What do you do now?

Most of the time, memory errors can mean that not enough conventional memory is available for applications to use. It also can mean that a couple of simple changes need to be made in Windows. A good rule is to have at least 580K of available conventional memory. Although not all applications require that much to start and operate, it is helpful since you will most likely have more than one application running at the same time in Windows.

There are two files which instruct the computer what files and programs to load, where to find those files and programs and how to load them. These are the CONFIG.SYS and the AUTOEXEC.BAT files.

The CONFIG.SYS instructs the computer to load and configure the operating environment. The AUTOEXEC.BAT tells the computer what software applications and Terminate and Stay Resident programs (TSRs) to load and how to fine tune the operating environment. When using the memory management system provided with MS-DOS, the commands which instruct DOS to move a device driver or program into the high memory area are DEVICEHIGH in the CONFIG.SYS and LOADHIGH (or LH) in the

AUTOEXEC.BAT.

There are three basic things to investigate when an "out of memory" error is displayed when using an application in Windows. These include the examination and adjustment of the of the swap file for virtual memory; checking the amount of conventional memory available; and editing of your AUTOEXEC.BAT and CONFIG.SYS files.

Before you begin, always backup your files. To make backups of the AUTOEXEC.BAT and CONFIG.SYS files, type the following commands at the C:\\ prompt:

To save the AUTOEXEC.BAT file, type:

COPY AUTOEXEC.BAT AUTOEXEC.SAV

Then press Enter.

To save the CONFIG.SYS file, type:

COPY CONFIG.SYS CONFIG.SAV

Then press Enter.

Examine Virtual Memory swap file size
Check to see that there is a Windows Permanent Swap File and that it is at least 5MB in size. To check this, open Control Panel, click on the 386 Enhanced icon, click on Virtual Memory and view the displayed description. The second point only applies if you are using Windows for Workgroups. If you are using Windows for Workgroups, open File Manager from Program Manager, and locate the CLARIS.INI file in the Windows directory. Open that file and look for the line which reads: "Cache Size=xxx" (where "xxx" is a number). Edit this line so that it reads:

Cache Size=0

Save the file and close File Manager. Now, close Windows.

Check amount of available conventional memory
At the C:\\ prompt, type the following command:

MEM

Press Enter.

On the resulting display, examine the value labeled "Largest Executable Program Size." This value is the amount of available conventional memory. That part of the 640K range which is not being used by anything. The number should be around 580K. If this number is below 580K, you will want to examine and edit your AUTOEXEC.BAT and CONFIG.SYS file, so that as many as possible device drivers and programs are loaded high. For example, in the CONFIG.SYS file you may have a line like the one below:

DEVICE=C:\\DOS\\SETVER.EXE

The correct syntax which will instruct MS-DOS to remap the file into the high memory area (assuming your system is using MS-DOS 6.0 or higher) is as follows:

DEVICE=C:\\DOS\\HIMEM.SYS
DEVICE=C:\\DOS\\EMM386.EXE NOEMS
DOS=HIGH,UMB
DEVICEHIGH=C:\\DOS\\SETVER.EXE

In the AUTOEXEC.BAT file, there may be a line which reads something like:

C:\\MOUSE\\MOUSE.COM

This can be loaded high by using the following command:

LH C:\\MOUSE\\MOUSE.COM

Please note: Any changes you make to these files do not take effect until you reboot your computer.

General Protection Fault
A memory error
A General Protection Fault (GPF) fault signifies that something unexpected has happened within the Windows environment, usually an improper memory access. In other words, something running within the Windows environment has made a call to a location in memory that it should not have had access to, potentially overwriting and corrupting other program code in that area of memory. An application or Windows component might read or write to a memory location that it has not been reallocated, or memory that it does not "own."
Another situation where a GPF fault may occur involves the passing of parameters between applications and the Windows environment. Invalid parameters affect the performance of Windows and its applications by forcing an invalid instruction. This is usually the result of an application's internal program code incorrectly passing specific data that could not be correctly interpreted for Windows or another Windows application. The result is often a GPF fault, or it may "lock up" your system or give any of numerous other error messages.

General Protection Faults and Video
GPFs might also be occurring because of a video driver memory conflict. Try the following if you suspect a memory conflict.

1. Exclude video memory X=A000-C7FF from the EMM386 line in your config.sys file so that it reads:
Device=C:\\DOS\\EMM386.EXE X=A000-C7FF NOEMS
2. Try a different driver, such as Windows VGA. To change the video driver go into Windows Setup (found in the Main group) and change the system setting for Display to VGA. You may need your original Windows disks to this.

The quick test for this kind of conflict is to boot your computer without loading unnecessary drivers and devices. This is commonly known as a "clean" or "vanilla" boot and can be very helpful for general troubleshooting computers running MS-DOS 6.0 (or higher): Press the F8 function key on your keyboard when the line "Starting MS-DOS" appears at startup time. This allows you to boot the CONFIG.SYS and AUTOEXEC.BAT line by line. You want to specify "yes" for loading the Device=C\\DOS\\HIMEM.SYS, and not anything else.

For computers running older versions of MS-DOS, you can use a boot disk to get the same effect as the vanilla boot. To create a boot disk, you need a floppy that fits in your A:
drive. Format the disk by typing the following at the DOS prompt:

FORMAT A: /S

[This is the command for high density drives. For low density and 5 1/4" drives, please consult your MS-DOS documentation. -Ed.]

Once the format is complete, use the MS-DOS Editor to create a file on the disk called CONFIG.SYS. This is the same file that you used earlier to load devices. This time, however, the file needs to "tell" your system to load only one device, HIMEM, which is necessary to launch Windows. In this new file, then, you need only type one line:

DEVICE=C:\\DOS\\HIMEM.SYS
Make sure the file is saved to the floppy disk. Now, any time you want to see if doing a vanilla boot fixes your problem, insert the boot disk in your A: drive and reboot the
computer.

A few notes on troubleshooting memory issues
Troubleshooting your Claris Windows applications may require that you make note of your computer's behavior. For example, you may be dealing

with a memory issue if a problem or error occurs only when there is more than one file open. As another example, you may experience errors only during a certain sequence of events (e.g., you may change a style, then get a GPF or lock-up when attempting to print). Before treating these errors as memory-related, first ask yourself if you can rule out hardware errors: check cable connections; turn things on and off; reboot; check to see if the error occurs with other machines. If the error still occurs, check to see if the error occurs with other files. You could be dealing with damage in a single document, in which case you may need to resort to a backup. If the error still occurs in other documents, try the vanilla boot. Then, you can back up your CONFIG.SYS and AUTOEXEC.BAT files and try some of the simple editing techniques described in this article.

Memory management tools and limited space

Having zeroed in on your memory-related errors and found out that all of your conventional and upper memory has been used, you may consider investing in a third party expanded memory manager, such as QEMM or 386Max, utilities dedicated to handling memory on your PC. These utilities increase the capacity of the upper memory block, allowing you to load as many devices high as you need and freeing conventional memory for your programs.

Please note: Mention of third party products constitutes neither an endorsement nor a recommendation. Claris assumes no responsibility with regard to the performance or use of third party products.

New Features in ClarisImpact 2.0

The new ClarisImpact is packed with new features for the business and education fields.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Introducing ClarisImpact 2.0--Claris Corporation's cross-platform business productivity tool for creating professional looking business graphics. A myriad of new features and enhancements make ClarisImpact 2.0 the speediest tool for creating and editing flow charts, org charts, calendars and more. The new features are explained briefly below.

Cross-platform support
While the enhancements to the ClarisImpact original feature set are profound, among the most impressive of its improvements is the effortless sharing of ClarisImpact files between Windows and Macintosh computers. This means that ClarisImpact 2.0 provides the fastest way to create high-quality diagrams, charts, presentations and more, on both the Macintosh and the PC!

DataDraw chart and graphing feature
This dynamic new feature provides an automated method for creating a diagram or chart from data exported from FileMaker Pro or any database which supports tab or comma delimited export files. By automatically turning names, dates and numbers into org charts, schedule charts, data charts or calendars, DataDraw gives you "at-a-glance" insight into the information in your database.

Organization chart enhancements
It's easier than ever to make complex organization charts fit into your available space with the addition of boxes that grow automatically and shrink automatically when data is added or deleted form a chart, tighter spacing between boxes and the ability to resize the entire org chart. New flexibility makes customizing the ClarisImpact pre-designed layouts fast and intuitive. For example, you can now specify the entire document reduced to fit a single page by just one click of the mouse!

New flow chart diagrams and symbols
Flow charts now include nine symbol sets to create a much wider variety of connected diagrams including Telecommunication and Transportation networks, Decision Trees, Brainstorming, Root Cause Analysis, Total Quality Management and Block Diagrams. New symbol creation controls, and the ability to attach text to a connector make flow chart creation easier and speedier.

Scheduling charts
Scheduling timeline charts are easier to read and easier to use for simple project planning or status reviews. Gridlines automatically adjust to match your project dates, tasks can be linked and unlinked to one another, and any task can be designated as a milestone.

Redesigned styles
All of the ClarisImpact styles have been professionally redesigned to reflect today's business standards. The styles now include customizable layout selections for each graphic that can be mixed and matched with a new selection of color and black & white styles. This combination speeds your graphic creation by allowing you to mix a pre-designed font and color scheme with whichever layout best communicates your data.

New presentation tools
To make communicating your ideas easier, the re-vamped presentation environment includes an integrated outliner to organize your thoughts before they appear on your slides and a slide sorter to view and rearrange your entire presentation at-a-glance. Speaker notes help you deliver your presentations while the new slide transitions and styles add a touch of pizzazz to on-screen presentations.

Spreadsheet functionality in tables
In addition to handling regular text, tables now offer the functionality of spreadsheets by supporting industry-standard formulas and summationsÑall of which are well documented in the extensive on-line help system.

More intuitive data charting tools
We've added many new chart types, simplified the terminology and included more ways to customize the charts to match your data.

More types of calendars supported
Calendars now better match basic business requirements by supporting week number display and the creation of weekday-only calendars. New calendar art for graphically highlighting holidays and other common events are also included.

Improved graphics tools
A broader palette of colors and gradients offers more artistic flexibility, plus the new Object Info palette and new zooming controls offer greater control to get your work done faster. New clip art libraries offer a colorful variety of high-quality art to use in creating clip art and block diagrams.

Claris Impact: Creating a Timeline

Here's how to use the ClarisWorks spreadsheet in a time(line)ly manner.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Picture this: Your boss just left your office insisting that a timeline for the Sushi Bar Project plan had to be completed by the staff meeting on Friday. Unfortunately you don't have ClarisImpact, a software package that does timelines, nor do you have time to get it, let alone learn how to use it. Fortunately, you do have ClarisWorks and thought of creating a drawing with the timeline information in it. This would work if the dates were firm and you had to do it once, but, as with all projects, the dates are cast in Jell-O and a drawing would be very tedious to change every time a date changed. Then you realize that, with a little effort, you could simulate a timeline by creating a spreadsheet that uses the Repeat function.

Timelines are graphic representations that show all of the separate tasks required to complete a project in the sequence in which they occur. Consequently, you must know the tasks required and the starting date and projected duration of each task. Each task would occupy a row in the spreadsheet and normally, but not always, are listed in starting date order. Occasionally it is desired to have related tasks on adjacent rows to emphasize the relationship between them.

To create your timeline, open a new ClarisWorks spreadsheet and create a title for the timeline by typing "Sushi Bar Project" in cell F1. Choose an appropriate font, size and center justify the text from the Format menu. In the example shown in Figure 1, the title has been set to Palatino, 18 point, bold, center-justified. Also, the height of Row 1 has been adjusted to 24 to fit the larger font size of the title.

Go to cell C3 and type "Start Date", press enter. Move to Cell C4 and select Number... from the Format menu. Choose the date format you prefer from the date format options under this menu. C4 is the cell that will be used to enter the actual start date of the project and will be used by calculations entered into other cells. Type in the actual start date of your project into cell C4. (Figure 1 uses 4/3/95 as a start date.)

In cell C5, type the following function:

=DAYNAME(WEEKDAY(C4))

This will place the name of the day of the week in that cell. Select the cells in B, C and D by clicking, and dragging through as many rows as you have tasks. Next, choose

Center from the Alignment sub-menu in the Format menu to format the cells.

Type the text, "Now:" into cell D5. Format with Right Alignment and a Bold font style. This is a label for the cells to the right of it that are going to indicate where the current date falls in the project.

Cell E5 is the first example of the use of the Repeat Function in our timeline. The repeat function has two arguments, the text that is to be repeated and a number (or calculation) that determines how many times the text is to be repeated. If you choose Paste FunctionÉ from the Edit menu, the Repeat function would appear as: REPT(Text , #_of_times).
If you typed "=REPT("xxxooo",4)" in a cell the result of the function would be: xxxoooxxxoooxxxoooxxxooo.

Go to Cell E5 and type the following:

=REPT("-", NOW()-C4) & "|"

The first argument ("-") is the text, a hyphen enclosed in quotes, that repeats in this field. The second argument, NOW()-C4, is equal to the number of days between the current date, "NOW", and the starting date of the project which is entered in Cell C4 and is the number of hyphens that will be entered in this cell. The & "|" at the end of the calculation will show the location of the current date.

Cell E5, and the other cells that use the repeat function, must be formatted using a mono-spaced font such as Courier. You are using a text character to display a graphic representation of time. Since time is made up of a number of increments of constant width (days in this case), the unit selected to represent time must also be a constant dimension. To make things easy to format, select the cell range from E5 to M12 and format these cells as follows: font of Courier, font size of 12 Points, Column Width of 48. The actual area used will vary according to the number of days in your project. It is essential that the graph (or timeline) area be formatted in this manner.

The next step is to add the dates to the graph area. First of all, select cells E6 through M6 and specify a date format from the Number... sub-menu of the Format menu. Go to Cell E6 and enter:

=C4

This sets the first column of the graph to the start date of the project. Tab (or move) to Cell F6 and enter the formula:

=E6+7

This adds one week to the start date. Select cells F6 through M6 and then choose Fill Right from the Calculate menu. This gives you nine weeks of dates for your project. It may be necessary to reformat the text in Row 6 to a 9 point font size so the dates will fit in the columns. If your project is longer than nine weeks, add a column for each additional week. (Remember to format the additional columns as Courier with a columns width of 48, and to format Row 6 to display a date format.)

Type the text, Task, From, To, and Duration as headings in Row 7 of Columns A, B, C, and D, respectively (refer to Figure 1 for guidance, if necessary). In cell E7 type the second use of the repeat function:

=REPT("^", WEEKDAY(C4)-1) & "|"

[For clarity, the "^" indicates where a space should be typed.]
This places a vertical bar reference mark within the cell that approximates the position of the day of the week for the date in the cell above it. Select Cells E7 through M7 and choose Fill Right from the Calculate menu. This puts the reference mark below each date in the timeline.

Starting in Row 8, enter the tasks required for the project in Column A. Enter the From dates for each task in Column B. Enter the End dates for each task in Column C. Then go to Cell D8 and enter the formula:

=C8-B8

Starting at Cell D8, select it and the cells below it for as many tasks as you have in your project and choose Fill Down from the Calculate menu. This formula calculates the number of days from the beginning to the end of each task. In the example in Figure 1, you would select cells D8 down to D12 before choosing the Fill Down command.

To create the actual timeline bar you use the Repeat function twice in the same formula. The first Repeat function will put spaces in the bar for the number of days between the start date of the project and the start of the task. The second Repeat function will place bullets (Option-8 on the Macintosh keyboard; on Windows hold down the Alt key and type 0149 on the numeric keypad) in the bar from the start of the task to the end of the task. You can use any mono-spaced character in place of the bullets, such as diamonds (Option-Shift-V on the Macintosh; on Windows hold down the Alt key and type 0224 on the numeric keypad) or triangles (Option-J on a Macintosh).

To create your timeline bar formula, go to Cell E8 and enter:

=REPT("^", B8-C4+1) & REPT("¥", D8)

[For clarity, the "^" indicates where a space should be typed.]
Starting at Cell E8, select the cells below it for as many tasks as you have in your project and choose Fill Down from the Calculate menu (in the example, cells E8 through E12 were selected). Again, the cells that contain the Repeat function must be formatted with a mono-spaced font in order to display the bar accurately.

This is a quick, simple timeline that may fill your needs when you are in a jam. If you wish to have a full featured timeline capability, have your dealer give you a demonstration of ClarisImpact.

Blank Pages Print from HP DeskWriter or DeskJet Printer

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Issue:
Printing from a Macintosh to an HP DeskWriter or DeskJet printer. The first few pages print correctly,but subsequent pages print out blank.

Fix:
Get the current version of the printer driver software.
You can get the latest software for your printer from the Internet, America Online or by phone.

Web / Internet:
http://www.hp.com:80/cposupport/cpoindex.html#Printers

America Online:
Keyword: HP

ClarisWorks 4.0, 5.0: Assistants, Library Art Not Listed

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

Note: The information in this article applies to the following software:

- ClarisWorks 4.0
- ClarisWorks 5.x
- AppleWorks 5.x

This article has been archived and is no longer updated by Apple.
If you are using ClarisWorks 4.0 or 5.x, or AppleWorks 5.x, and your Assistants and Stationery files are not listed in the New dialog (or your libraries are not showing in the Library list in the File menu), check the following:

Verify that the application is in the same folder as these folders:

- ClarisWorks Assistants
- ClarisWorks Libraries
- ClarisWorks Scripts
- ClarisWorks Stationery
- ClarisWorks Styles

Note: AppleWorks users will find that the folder names begin with "AppleWorks" rather than "ClarisWorks".

When the application is installed, it creates a new folder on your hard drive containing all of these folders. If you would like to move the application to another place (Apple Menu Items, Launcher, Desktop...) do the following:

1. Click once on the application icon to select it (but don't launch it).
2. In the File menu, choose Make Alias. (A duplicate item will be produced with italic letters and "alias" at the end of the name.)
3. Move the alias to the desired location.

If you had a previous version of ClarisWorks, there may be a ClarisWorks Stationery folder in your Claris Folder in your System Folder. You will see that the contents are very similar to the ClarisWorks Stationery folder contents in the ClarisWorks 4.0 folder. If you wish to combine the two stationery folders, keep the new ClarisWorks Stationery folder in the ClarisWorks 4.0 folder. Move any desired stationery from the "old" stationery folder into the new one in the new ClarisWorks 4.0 folder. Then throw out the old ClarisWorks Stationery folder from the Claris folder.

Inserting a Field Multiple Times Into a ClarisWorks Database

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There is an undocumented way to get a single field into a layout multiple times in a ClarisWorks database. This may come in handy if you are nearing the 255 field limit, and would like to eliminate calculations that only mirror another data entry field. Follow these steps and you will be able to insert the field as many times as you need.

1. In layout mode drag the field you would like inserted a second time up to the TOP of the layout, so that the field is partially off the top of the layout.

2.Go to the layout menu and choose Insert Field. You should see the field that has been dragged partially off the layout is now available to insert.

3. Highlight the field and choose Insert.

4. Drag the original of the field back down on to the layout.

Warnings:
The last occurrence (the one inserted last) will be the only one in which you may do data entry.

The other occurrences of the field will not show the information entered until a new record is created, or until you toggle Page View and will not be editable.

Installing HTML Primer File Using Custom Install

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The HTML Primer file is not listed as an option in Custom Install in ClarisWorks 4.0. However, the HTML Primer file can be installed by doing a custom install and choosing File Translators.

This file can also be installed with an Easy Install, which reinstalls the complete program.

Finding the ClarisWorks 4.0 Function List In The Online Help

Instructions for how to see the function lists in ClarisWorks 4.0 for Macintosh

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
To see an alphabetical listing of all ClarisWorks spreadsheet and database functions:

1) Pull down the help menu, and select Index.
2) Within the index scroll to functions. As a shortcut, simply type fun, and the index screen will jump to the functions topic.
3) Within the functions listing, you will see About functions and Alphabetical list of functions. Click the Alphabetical list of functions topic, and click the Go To Topic button.
4) You will see a list of all of the ClarisWorks functions. This can be printed from the File menu.

Note at the end of the function list, you can break down the list by the selected categories:

Alphabetical list of functions
The following is a list of all ClarisWorks functions in alphabetical order.

DataDraw Documents Always Update When Used Cross-Platform

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When opening a DataDraw document that has been set to automatically update on opening, you will see a Data Import Status notification. Assuming that there's one DataDraw object in the file, if the data file has NOT changed since the last time the document was opened and saved, the notification will say "1 graphic was already up to date." If the data file HAS changed, the notification will say "1 graphic was successfully updated."

When opening an up to date file on the other platform, however, the graphic will always "update." In other words, if you save a file on a Macintosh and close it, then open that file with ClarisImpact Windows (without changing the data file) you will see a Data Import Status notification of "1 graphic was successfully updated".

While it may be inconvenient to wait for the graphic to update when it should already be up to date, it should be noted that the resulting file is correct.

File‘s Library Does Not Automatically Open (Cross-platform use)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you save and close a ClarisImpact 2.0 document with a library open (on the same volume) that library will open when you open the document again. This is also true if the document and library are saved to a server.

However, the link is lost when the file is taken across platforms. For example, if you place a library on a server and save a document there with the library open using ClarisImpact Windows, and then open the file with ClarisImpact Macintosh the library will not open with the document. The same is true in the reverse (Windows to Macintosh).

To see this:
1. Place any library on a server.
2. Create a document and open the server library.
3. Save the document to the same location as the library.
4. Close the document and open it on another platform (Mac to Win or Win to Mac).

Note that the document opens without the library.

Claris Impact: Movies Startup and Stop Differently When Using Markup

There are some platform-specific differences in the way that Macintosh and Windows movies will have their playback interrupted.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
A ClarisImpact slide presentation can contain movies (QuickTime on the Macintosh, AVI on Windows). When using the slide markup feature, a movie will be interrupted and stop playing. The point of interruption differs on each platform.

On the Macintosh, when using markup, holding the mouse button down (mouse-down) stops a movie; on Windows it doesn't stop until the mouse button is released (mouse-up).

To see this on Windows:
1. Open a ClarisImpact Windows presentation
2. Place an AVI movie.
3. Open Slide Show dialog.
4. Select Markup, Auto Play, and Complete Play Before Advancing.
5. Click Start.
6. After the movie begins, hold down the mouse and markup the slide.

Notice that the movie doesnÕt stop playing until mouse-up; on the Mac, it stops at mouse-down during markup.

Open Library Dialog Permits File Multi-Launch

This is an issue in ClarisImpact for Windows, which only appears if you are accessing the Open Library dialog.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If a ClarisImpact document which is being stored on a server of some kind is opened, anyone else trying to access the file over the network should receive the message "File is already open."

However, there is an error in ClarisImpact for Windows. If the first person to open the file chooses File menu: Open Library and leaves that dialog box open, any of their open files or libraries can be opened by another person using ClarisImpact for Windows.

Exact steps to reproduce:
1. Use 2 PCs with access to the same libraries and ClarisImpact files on a server.
2. Launch on one PC and open a server file and a server library.
3. On the same PC, open the Open Library dialog.
4. Launch on the 2nd PC and try to open the same file and library from the server.

The files open instead of displaying the File already open alert.

Claris Development is aware of the issue.

ClarisWorks Mail Merge - Print Merging Multiple Files Is Not Supported

Although ClarisWorks allows you to select more than one file to merge into a word processing document, it will merge only the first file's data.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
ClarisWorks mail merge allows you to merge fields from more than one file into a word processing document. However, this feature is not supported. When you perform the print merge, only the fields from a single file will be merged. The fields from the other files will print as the field names instead of the merged data.

The best solution is to combine the information from both databases into a single database, then merge.

Getting the Best Results with the HTML Translator

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When using the ClarisWorks WWW [HTML] translator, results will vary depending on the web browser being used to capture the page. Below are some guidelines for using the HTML translator.

If you are saving a document from Netscape Navigator, choose Save As, and choose source from the pop-up menu in the Save As dialog box. Save the document to your local drive. Then open the resulting saved document from ClarisWorks with the WWW [HTML] translator.

If using Mosaic, make sure you have the latest version (2.0.1 is the latest version at time of this printing). Best results are achieved when using the View Source command under the File menu.

When using the View Source command in Mosaic, make sure you have a text editor helper application set up in preferences. When you choose View Source the text editor will open up a document full of HTML code. Save this document out of your text editor, and open the resulting saved document in ClarisWorks with the WWW [HTML] translator.

The steps for making sure the file gets opened with the HTML translator and not the TEXT translator for all web browsers are as follows:

1. From the File menu in ClarisWorks, choose Open.
2. From the Document Type pop-up menu, choose Word Processing.
3. From the File Type pop-up menu, choose WWW [HTML].
4. Select the saved web page.
5. Click Open.

Warning: There is currently a non-certified version of the HTML language that has recently become very popular and is not supported by the ClarisWorks HTML translator. The new HTML information will be translated to literal HTML tags. This will usually be red-colored text surrounded by < > with black text interspersed within.

<Text-2>My Home Page </Text>

In short, the HTML translator tries to make everything as WYSIWYG (What You See Is What You Get) as possible, but will give you literal HTML tags if the information is not included in the HTML commands included in the translator.

Setting The Options For The Standard Stationery In ClarisWorks 3.0 for Windows

The online information given on this topic is incorrect, below is a correction.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Setting The Options For The Standard Stationary In ClarisWorks 3.0 for Windows The online documentation for setting the default document options is incorrect. It states that you must save the files to the: \\WINDOWS\\CLARIS\\TEMPLATES directory when actually they should be saved to the:
\\WINDOWS\\CLARIS directory.
Saving them to the:
\\WINDOWS\\CLARIS\\TEMPLATES directory will make the default change once, but when you exit ClarisWorks and relaunch it, they will be lost.

Also be aware that when the defaults are changed, the new document windows will also add a Standard {module type} option.

No Blinking Insertion Point in ClarisWorks 3.0 for Windows (WP, SS)

How to determine what video driver you have to see if it has been tested as less reliable with ClarisWorks for Windows

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
No blinking insertion point in Word Processing or Spread Sheet documents with these drivers.

To see which video driver you currently have installed, go to Windows Setup in the Main window. Under Display you will see the name of the driver, for example:
CLGD5426/28 1.41 640x280x256. This is the name of one of the specific drivers we have had reported problems with, the Cirrus Logic 1.41 driver.

If you are running a Cirrus Logic driver whos version is lower than 1.43, then you will need to install the 1.43 CL-GD5428 driver on the system and follow the steps below. To obtain the updated driver, please contact Cirrus Logic at the following:
Cirrus Logic
3100 West Warren Avenue
Fremont, CA 94538
Tel: 510-623-8300
Fax: 510-226-2180
BBS: 510-440-9080

A- First run Install from the 1.43 driver disk to install this driver.

Now do the following steps to fix the driver:

1. Exit Windows and go to DOS
2. Insert the 1.43 driver disk in drive A:
3. Type 'A:\\' (or your appropriate floppy disk drive letter)
4. Type 'CD^512K' (a caret ^ indicates a space to be typed)

5. Type 'COPY^256_1280.DRV^C:\\WINDOWS\\SYSTEM'
(This will replace the driver that was already installed in step A)
6. Restart Windows

This problem has also been noted when the following drivers are installed:
ACTIX Prostar5 1.53
VC300 VGA 64x480x256

To correct the problem, you have several options. You can install the VGA driver from your Windows Setup Icon under Options - Change System Settings, then select the driver that says "VGA" only. This will produce an insertion point as well as get you through the introduction, but it will change your display to VGA 640 x480x 16 colors.

Claris has also developed a revision of ClarisWorks, 3.0v2, that addresses this problem as well.

You can also check with either the video card manufacturer or the video driver manufacturer to get updates to their drivers.

ClarisImpact 2.0 CD Mentioned in Installation Guide, but not Available at This Time

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Installation Guide for ClarisImpact 2.0 gives instructions for installing from diskettes and also from a ClarisImpact 2.0 CD.

At the time of shipping ClarisImpact 2.0 (August, 1995) the CD is not yet available. At some time in the future the CD will be produced. Pricing and availability are not determined at this time, though we anticipate that it will be provided to ClarisImpact owners on request.

Published Date: Feb 18, 2012

ClarisImpact 2.0 System Requirements and Printer Support (Mac)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The minimum system requirements for ClarisImpact 2.0 for Macintosh are as follows:

Apple Macintosh, Power Macintosh or compatible computer with 68000 processor or higher
1.4MB high density floppy disk drive
Hard disk drive and 4MB memory
8MB recommended for System 7
8MB required for Power Macintosh
System software 6.0.8, System 7 or System 7 Pro, System 7.5

Printer Support

Apple LaserWriter, Personal LaserWriter, and ImageWriter, and Apple StyleWriter families
Hewlett-Packard (HP) LaserJet, DeskWriter and PaintWriter families
A wide variety of other Macintosh-compatible, third-party printers

A list of specific printers which have been certified or verified as fully functional with ClarisImpact 2.0 is not available. In general , a printer that is compatible with Apple print drivers and/or the above referenced Systems should work with ClarisImpact 2.0.
Published Date: Feb 18, 2012

ClarisImpact 2.0 System Requirements and Printer Support (Win)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The minimum system requirements for ClarisImpact 2.0 for Windows are as follows:

PC with 386/25 MHz or higher processor
One hard disk, one 3.5" floppy
Microsoft Windows 3.1
WIN32s (included)
8 MB RAM

Printer Support
Hewlett-Packard LaserJet, PaintJet, DeskJet series
Postscript printers such as Apple LaserWriter, IBM Laser Printers
A wide variety of other Windows-compatible printers

A list of specific printers which have been certified or verified as fully functional with ClarisImpact 2.0 is not available. In general , any printer which is fully compatible with the minimum hardware and system requirements should work with ClarisImpact 2.0.

ClarisImpact and Corrupt Fonts

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The following is from the ClarisImpact 1.0v4 Important Information file:

Fonts
This version of ClarisImpact tests for corrupt fonts when the application is first opened and when opening the application when fonts have been added to your system. ClarisImpact builds a 'Claris Fonts' file which is used to display fonts in their actual typeface in the Font menu. If ClarisImpact encounters a bad font, or one that it cannot correctly add to the Claris Fonts file, an alert is displayed indicating that some fonts may be bad. These fonts will be listed in a 'Bad Fonts' text file in the Claris Folder located inside your system folder. These fonts will also be displayed in Chicago font in the application's Font menus. We suggest removing or replacing these fonts from your system before using ClarisImpact. Refer to the manual that came with your Macintosh for instructions on how to remove or replace these fonts. Once these fonts have been removed or replaced, throw away the 'Claris Fonts' file, also located in the Claris folder, and open ClarisImpact. ClarisImpact will automatically create a a new 'Claris Fonts' file when the application is opened.

There may be some fonts that work properly in ClarisImpact and still fail our tests. The only difference between these and other fonts is that they will be displayed in Chicago font in the Font menu. However, we suggest performing the following simple tests on these fonts before by using them in the application:
1) Create some text in ClarisImpact and apply the font. If the application unexpectedly quits, this font is bad and should be removed or replaced immediately.
2) If the application does not quit when the font is applied, create multiple pieces of text, apply several different font sizes, and print the file. If the font appears on screen and on paper correctly, then there is no need to replace or remove this font.

Note: If you have a font that fails our test but functions properly, please send the font to Claris Technical Support so that we can update our test for future releases of ClarisImpact.

AppleTalk Phase 2: Using LocalTalk-Based Networks

I am beginning to implement the DataKit technology from AT&T. The DataKit follows the AppleTalk Phase 2 router-to-router communications and is completely AppleTalk Phase 2-compatible. However, we have all PhoneNET networks running AppleTalk Phase 1 routers in the form of Hayes InterBridges.

These networks go through star controllers, and the DataKit will hang off one port of the controller. The DataKit is also an AppleTalk Phase 2 router, so it will be sending AppleTalk Phase 2 packets to the LocalTalk network.

Given this background, can you answer the following questions?

1. It was my understanding that LocalTalk-connected Macintosh systems could not take advantage of AppleTalk Phase 2 addressing. Why is this?
2. What about upgrading the Hayes InterBridges?
3. Does this mean that only the AppleTalk Phase 1 routers need to be upgraded to AppleTalk Phase 2 (like the Hayes InterBridge) and the rest of the nodes just become AppleTalk Phase 2 by installing AppleTalk version 53 in the System Folder?
4. Am I supposed to run the Internet Router in conjunction with the Upgrade Utility forever? (Do I have to use the Apple product? Does Kinetics or Hayes have an upgrade utility?) Can a LocalTalk network be AppleTalk Phase 2 by upgrading AppleTalk to override the ROMs, even though it cannot take advantage of AppleTalk Phase 2 addressing? Does the account have to upgrade all of their existing AppleTalk Phase 1 products to AppleTalk Phase 2, even though they are using only LocalTalk (inherently AppleTalk Phase 1)?

This article has been archived and is no longer updated by Apple.

```
1) The AppleTalk Phase 2 extended-addressing and multiple-zones-per-physical-
  network features were not implemented on LocalTalk because of the limited
  number (32 maximum recommended) of nodes that can be attached to one
  physical network.  This is far less than the 254 nodes that AppleTalk
  Phase 1 supports.  EtherTalk and TokenTalk can support many more than 254
  nodes per physical network and, therefore, need the extended addressing and
  multiple zones capabilities that AppleTalk Phase 2 provides.

2) If the AT&T DataKit router is AppleTalk Phase 2 only and has nothing like
  our AppleTalk Phase 2 Upgrade Utility for dealing with AppleTalk Phase 1
  routers, it will be necessary to upgrade the Hayes InterBridges to be
  AppleTalk Phase 2-compatible.  Contact Hayes for information on this
  upgrade.

3) LocalTalk-based networks can be attached to AppleTalk Phase 2-compatible
  routers with LocalTalk ports without the AppleTalk version 53 file in the
  System Folder.  In fact, this is the most common setup.  The only time you
  need the AppleTalk version 53 file in the System Folder is when you need to
  support some of the new high-level AppleTalk calls that do not in any way
  change the protocols used on the LocalTalk physical medium.  These new
  high-level AppleTalk calls are documented in Macintosh Technical Note #250.

4) The AppleTalk Internet Router does not need the AppleTalk Phase 2 Upgrade
  Utility when routing between two LocalTalk-based networks.  The AppleTalk
  Phase 2 Upgrade Utility allows the AppleTalk Internet Router to broadcast
  and receive AppleTalk Phase 1-style RTMP packets.  This is all the AppleTalk
  Phase 2 Upgrade Utility does.  The only time the AppleTalk Internet Router
  needs the AppleTalk Phase 2 Upgrade Utility is when there is an AppleTalk
  Phase 1 router on the same physical cable as the AppleTalk Internet Router.
```

ClarisImpact and Memory on the Power Macintosh

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The following is from the ClarisImpact 1.0v4 Important Information file:

Power Macintosh applications are larger and require more memory than conventional Macintosh applications. The ClarisImpact application memory setting is set to 3714k when running with the default Power Macintosh system memory settings(Modern Memory Manager ON and Virtual Memory OFF). The ClarisImpact memory requirement is reduced to 1250k when Virtual Memory is turned ON.

If you have an 8MB Power Macintosh and usually run more than one application, you may want to turn Virtual Memory ON so that there is enough memory for these applications. However, performance is optimized when running with the default system settings.

If you plan on using all of the Model and Element styles, we suggest that you increase the application's default memory partition by 1000k. Refer to "Adjusting memory" on page 1-13 of "ClarisImpact Getting Started".

Occasionally in low memory situations an alert will appear stating "There is not enough memory to complete this operation". We suggest saving your document before continuing. If you are working with large documents and find yourself in this situation frequently, we suggest increasing the application's memory partition as indicated above.

ClarisWorks 4.0 Macintosh Trial Software on CD

The first release of the ClarisWorks 4.0 Trial Software had incorrect instructions and an incomplete set of files.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
ClarisWorks 4.0 Trial Software is a limited version of the full application. It cannot save, and prints with the words 'ClarisWorks Trial' in the background. The trial software includes only some of the Stationery documents, Libraries, and Assistants. In addition it comes with installation and usage instructions that walk you through trying the product.

The first release of the ClarisWorks 4.0 Trial Software took place on the Trial Software CD . This version had incorrect instructions and an incomplete set of files. The part number for the affected CD is U95073-015B. This number can be found on the CD itself.

The problems on this CD are in the Begin document which walks you through trying the software. In this document you are instructed to:
- Save the database file they create to use in mail merge.
(Problem: It is not possible to save a document in the trial version.)
- Use the Final Newsletter document as a guide for the document you were creating.
(Problem: This document is missing.)

You can obtain a corrected version of this trial software on America Online, CompuServe and AppleLink. Please download this version and follow its instructions for trying out the software.

High Density Floppy Drive Required to Install ClarisImpact 2.0

There are no 800k disks available in the fulfillment system to install on older machines.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The box for ClarisImpact 2.0 Macintosh states that a High Density (HD) 1.4mb floppy drive is required to install the product. While ClarisImpact will run on some machines that only have an 800K drive, specifically any Macintosh with a 68000 processor or higher, there are no disks available to install it.

Should you wish to install ClarisImpact and don't have a High Density Drive, consider these options:

1) If your Macintosh is on a network, install from a Server or shared volume. The Installation Guide gives detailed instructions on how to copy disks to a server for installation from a guesting Macintosh.

2) Install the ClarisImpact (temporarily so as not to violate licensing) onto a computer that does have an HD drive. Then use some compression utility (such as DiskDoubler or Stuffit) to move the parts onto 800k disks so that they can be copied to the Macintosh with the 800k drive. Refer to the TechInfo Brief entitled " ClarisImpact 2.0 Disk Contents (Macintosh) and Installation Guide" for a detailed account of which files get installed in which locations.

How to Create a Logo With Text and Graphics in ClarisWorks

A guide to creating logos that are saved a pictures so the fonts used are disassociated from the logo.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If you create a drawing, such as a logo that incorporates text, you need the fonts installed on your computer to view and print the text properly. This becomes a problem if you share files frequently with others who do not have the same fonts. You can eliminate the need for these fonts by converting the logo to a paint document.

To get a screen-resolution quality image (72 dpi) of your logo just copy and paste the original object and text to a new paint document. Then save the new paint document as a PICT file. You can then use this image in programs other than ClarisWorks.

To get a higher quality (~300 dpi) image for better printing output follow these steps:

1. Increase the size of the graphic 400 percent. Select your graphic and choose Transform from the Arrange menu, then choose Scale By Percent (ClarisWorks 4.0). In ClarisWorks 3.0 choose Scale Selection from the Options menu.

2. Increase the size of the text block by 4 times. For example, a text block formatted at 24 point size is set to 96 point size.

Note: Some objects may appear off the page because of the scaling procedure, however they are still available by choosing Select All from the Edit menu.

3. Move any objects as necessary to get them positioned properly.

4. Choose Select all from the Edit menu, then choose Copy.

5. Open a new Paint document.

6. Choose Resolution and Depth from the Format menu and set the resolution to 288 or 300 dpi. You may need to increase the amount of RAM allocated for ClarisWorks to 4 MB or so to do this as larger resolution document take more memory to create.

7. Choose Paste from the Edit menu to paste the logo into the paint document.

8. Choose Save As from the File menu, then choose the file type to PICT so that this image can be used in other documents or applications.

The paint document version of the logo will view and print properly, even if the computer does not have the fonts that were used to create the image. However, the text is no longer editable. Converting a drawing or text to PICT format or a paint document drops all the editing properties for the text or graphic. Therefore, you should keep the original draw document in case you need to edit the text later.

ClarisDraw: How to Fix Files Corrupted by the Original 1.0v2 Updater

The first release of the updater for ClarisDraw 1.0v2 corrupted files. This affected a relatively small number of people, but was very troublesome.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
In the Spring of 1995, an improper ClarisDraw 1.0v2 Updater was sent to approximately 140 ClarisDraw customers. This Updater created copies of ClarisDraw 1.0v2 that allowed people to edit their files once, but, after saving the file, would be corrupted and unopenable. If someone attempted to re-open the file they would see this error message:

"This is not a ClarisDraw file or it has been corrupted."

Fortunately, a fix has been found for these files, and it is quite simple. It requires a file editor such as the Norton Utilities application.

To fix the file using Norton Utilities:

- Copy the file to your hard disk
- Launch Norton Utilities
- From the UTILITIES menu, choose "Norton Disk Editor"
- Under "Choose a volume to Explore" select your hard disk
- Click "Open"
- Once the "Directory" opens, go to the FILE menu and choose "Open File"
- Find the corrupt file and click "Open Data Fork"
- When the data fork opens, go to the third byte (hit the right cursor key two times)
- Type b1
- Close the file, save changes to the sector

The file is now fixed.

Invoking a ClarisWorks 4.0 Macro with AppleScript

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
[NOTE: This script assumes you are using version 4.0 of ClarisWorks. It is also recommended that you have the following versions of software: System 7.1.1 or System 7.5; AppleScript 1.1]

APPLESCRIPT SCRIPTING LEVEL: BEGINNER

To invoke a ClarisWorks Macro from AppleScript, use the Do Script command, as in the following example. Be sure to replace the text between the quotes with the name of your macro:

```
tell application "ClarisWorks 4.0"
do script "Macro name here"
end tell
```

SCRIPTING SUPPORT

Apple Computer provides support for AppleScript and HyperCard. All customers have access to toll-free telephone support for pre-sales and Òup and runningÓ support by calling Apple Assurance at (800) SOS-APPL. ÒUp and RunningÓ support includes questions regarding installation, compatibility, configuration, and basic product use. Advanced scripting support is available for a fee by calling (800) 950-2442.

TRAINING
Self-paced and classroom-based instruction on Apple events and AppleScript is available from Apple Computer's Developer University (408) 974-4897, fax (408) 974-0544, and AppleLink: DEVLINK. Currently course offerings include "Scripting with AppleScript", "Introduction to AppleScript", and "Apple Events/AppleScript Programming."

Mail Merge Limitations of ClarisWorks 4.0

Some tips on making your end results appear correctly when using Mail Merge

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Here are some tips to better help you to understand what is and isn't available when using Mail Merge in ClarisWorks 4.0

Users of ClarisWorks 4.0 through 4.0v3 should update to version 4.0v4. An updater is available online from ClarisWeb at http://www.claris.com. It is also available on America Online (keyword: Claris) or Compuserve (Go MacClaris) or by phone at (800)544-8554.

1. When more than one field is on a line and they are all blank, the text below will not slide up to fill in the blank line. Sliding up works correctly, though, when there is a single field on a line in your merge document. So, to eliminate blank lines in your merge letter, go back to your database and define a calculation field that combines the contents of the multiple fields. Then use that calculation field in your merge document.

For example, let's say that you're merging two fields on a line called FirstName and LastName. Go to your database file and go to Define Fields. Define a new field called FullName, make it a calculation field with this formula:

IF(ISBLANK('FirstName'),"",'FirstName'&"^") & 'LastName'

In this formula, type a space where you see the caret (^). Set the calculation to result in Text.
Go back to your form letter and remove the FirstName and LastName fields. Place the FullName field in their place.

2. If a field has more than one line worth of text, it will truncate (cut off) at the end of the line.

An example of a field with more than one line of text:
Memo field (text) "Hello to all good people of the republic. Thank you for your support of my campaign for election."

Merge document:
<<Memo>>

Result:
Hello to all good people of the republic. Thank you for your support of my campaign for

Notice the word "election." is cut off and does not wrap to the next line.

Work Around:
None known at this time. You need to limit text in a field to no more than one line of text. Returns in a field are ignored and will not create a new line.

3. A field used in a line with text before the merge field causes the field to drop to the next line. The text over one line is still cut off.

An example of field dropping to the next line:
Product field (text) "textile equipment with optional quantity feeder"

Merge document:
We are glad to fill your order. We will be shipping your order of <<Product>> by the 15th of the month.

Result:
We are glad to fill your order. We will be shipping your order of
textile equipment with optional quantity feeder by the 15th of the month.

The entire contents of the field Product is moved to the next line. Wrapping of data within the field does not occur.

Work Around:
None known at this time. Text in a field cannot wrap to the next line so paragraph structure must not try to wrap data to a new line.

More Choices Button in the Color Picker

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
With the System 7.5 Color Picker installed on color systems, you will see a 'More Choices' button in the ClarisImpact Color Editing window.

When you click More Choices button, there are two choices: Apple HSL and Apple RGB. Clicking on Apple RGB will give you a window where you can adjust the Red, Green and Blue with a slider or by typing in the percentage desired.

Pre ?System 7.5 systems had one window with the RGB
controls on the left side of the window. With those limited controls, you could only type in the number or click on the arrows to change the Red, Green, and Blue.

ClarisDraw: Rulers with Hanging Indents Skip Tab Stops

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisDraw has an issue with tabs following hanging indents in a text frame that do not have some text entered at the tab. To reproduce the issue, follow these steps:

1. Turn on Text Ruler
2. Create a text frame that extends from 1" to 7.5".
3. Hold down the option key and move the right margin indicator (the sideways triangle on the left side of the ruler) to the 2" marker.
4. Place a left align tab at 2.25".
5. Place a right align tab at 7.25".
6. Press the tab key and type in the number 1.
7. Press the tab key and type in "Some Text"
8. Press the tab key and type in "Right Side"
9. Press the return key.

We are now on the second line of your text frame. We want to add some more descriptive text below "Some Text" without putting in a new line number.

10. Press the tab key. This takes you to the hanging indent.
11. Press the tab key again. Gee, what happened to the cursor???

The cursor has jumped to the right align tab on the right side of the page. Please note that the type of tab is not important, it just skips the first tab after the hanging indent.

The workaround is to enter a <space> after pressing the tab key to get to the hanging indent in step 10.

This problem does not occur in ClarisImpact or ClarisWorks.

EtherTalk 2.0: Networking Packet Formats and Protocols

1) With AppleTalk Phase 2, how does the SNAP (SubNetwork Address Protocol) work?

If this works with the condition: DSAP=SSAP in LLC (Logical Link Control), the first 5 bytes of the LLC Information (LLC data) is the PID (Protocol Identifier). In this case, what are the DSAP and SSAP used?

2) Also, if the above is correct, what is the Apple OUI (Organizational Unique Identifier) in the PID header?

Notes

IEEE 802.3 Frame

Preamble
Dest-Addr (6 bytes)
Source-Addr (6 bytes)
Length (2 bytes)
LLC-DSAP (1 byte)
LLC-SSAP (1 byte)
LLC-control (1 byte)
LLC-data (43-1497 bytes)

This article has been archived and is no longer updated by Apple.
1) With EtherTalk 2.0, Apple is adopting standard networking packet formats as defined by the Institute of Electrical and Electronics Engineers (IEEE) 802 committee. The 802 committee defines standards for local area networking.

The IEEE divides the OSI data link layer into the Logical Link Control (LLC) layer and the Medium Access Control (MAC) layer. The IEEE LLC layer provides error checking and reliable transfer of data. The LLC layer was defined to provide a uniform interface to the network layer, independent of the MAC and physical layers used. The LLC provides connectionless-oriented (Type 1) or connection-oriented (Type 2) services.

The MAC layer provides some of the lower-level functions of the OSI data link layer and some functions that fit into the OSI physical layer. These functions include channel (media) access, channel contention arbitration, and data formatting. The MAC layer has three variants:

- Carrier Sense Multiple Access/Collision Detect (CSMA/CD), which is similar to the Ethernet standard and is used in engineering and office automation applications.

- Token Bus, used in factory automation applications.

- Token Ring, which has been widely adopted by IBM and other companies for office automation applications.

Ethernet and 802.3 CSMA/CD are often incorrectly considered identical. Ethernet is a de facto local area network standard developed by Digital Equipment Corporation, Xerox, and Intel. It forms the basis for 802.3, but the 802.3 packet format is slightly different. Unlike the Ethernet packet, the 802.3 packet has no protocol-type field and has a data length field. Workstations using Ethernet packets do not recognize workstations using 802.3 packets, and vice versa.

The Ethernet protocol-type field is used to distinguish higher-level protocols. The protocol-type field allows for 64 different protocol

identifiers. However, with the maturation of local area network technology, 64 different protocol identifiers are too few. To accommodate the large number of protocols, the IEEE developed the SubNetwork Address Protocol (SNAP) standard.

SNAP allows multiple protocols to be used with one data link. It defines a 5-byte field to identify the protocol using the data link. It ensures that protocol identifiers from different vendors do not conflict. The IEEE has assigned Apple a SNAP identifier for AppleTalk and AARP (Apple Address Resolution Protocol).

With EtherTalk 1.0, AppleTalk data was transmitted in the data field of an Ethernet packet. With EtherTalk 2.0, AppleTalk data is encapsulated in a SNAP packet, which is encapsulated in an LLC packet, and transmitted in a CSMA/CD 802.3 packet. The result is that EtherTalk 1.0 packets are not seen by EtherTalk 2.0 nodes, and EtherTalk 2.0 packets are not seen by EtherTalk 1.0 nodes.

Though EtherTalk 2.0 uses the SNAP interface, higher-level protocols can go directly to the LLC layer, and not use SNAP. SNAP allows connectionless communication services only. Software developers that need to use connection-oriented services must bypass SNAP and use the 802.2 LLC interface directly. Such developers would use Apple's Ethernet driver for our EtherTalk card, but would not use our higher-level EtherTalk 2.0 software.

EtherTalk 2.x (802.3) Frame

802.3 Destination 6 bytes
802.3 Source 6 bytes
802.2 LLC Length 2 bytes
802.2 LLC Header
802.2 LLC DSAP 1 bytes (always $AA (SNAP SAP) for EtherTalk 2.x)
802.2 LLC SSAP 1 bytes (always $AA (SNAP SAP) for EtherTalk 2.x)
802.2 LLC Control 1 bytes (always $03)
SNAP Header 5 bytes (always $080007809B for EtherTalk 2.x)
DDP Header 13 bytes
AppleTalk Data ?? bytes (586 bytes maximum)
Padding (if needed) ?? bytes
---
60 to 621 bytes

DSAP - Destination Service Access Point
SSAP - Source Service Access Point
The SNAP SAP is defined as $AA.

If the 802.3 packet is less than 60 bytes padding is added to make the packet 60 bytes long.

In 802.2, DSAP and SSAP are almost always the same except in frames that are establishing an initial SNA connection.

2) The SNAP (SubNetwork Address Protocol) unique identifier assigned to Apple by the IEEE is $0800070000. The first 3 bytes of the unique identifier is the vendor address. The last 2 bytes are the local administered (by Apple) identifiers. We (Apple) have defined $809B as EtherTalk. The unique identifier for EtherTalk 2.0 is $080007809B. This is considered to be a locally administered SNAP address.

A global SNAP address has been defined by the IEEE for AARP packets. The SNAP number is $00000080F3.

These values are the same for TokenTalk 2.0.

Sharing Documents and Libraries Between ClarisImpact 1.0v4 and ClarisDraw 1.0v2

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The following is from the ClarisImpact 1.0v4 Important Information file:

ClarisDraw Compatibility
ClarisDraw documents and libraries are supported in this version of ClarisImpact. These documents can be opened directly and used as if they were created in ClarisImpact. However, objects unique to ClarisDraw are converted to ClarisImpact objects. The converted objects will look the same as they did in ClarisDraw, but they do not retain the ClarisDraw functionality. Libraries can be used interchangeably between the two applications, but application specific functionality is lost when saved in the other application's format.

Example: A ClarisDraw library that has a bound text object can be directly opened in ClarisImpact. When the bound text object is used in a ClarisImpact document, it gets converted to a conventional group. The object will look the same, but the functionality is lost. Similarly, saving this ClarisDraw library in ClarisImpact converts the library and its contents to a ClarisImpact library. The following alert is generated when saving a ClarisDraw library from ClarisImpact: "Saving this library now will cause some ClarisDraw objects to be converted to ClarisImpact objects. To retain a separate copy of this library, click "Cancel", then use the "Save As" command."

ClarisDraw also supports ClarisImpact documents and libraries. The ClarisImpact models will look the same in ClarisDraw but are converted to PICTs that do not retain the model's functionality. The following alert is generated when saving a ClarisImpact library from ClarisDraw: "Saving this library now will cause any ClarisImpact models to be converted to pictures. To retain a separate copy of this library, click "Cancel", then use the "Save As" command."

Subscribing to Excel Spreadsheets From ClarisWorks and ClarisImpact

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Microsoft Excel will, by default, publish a PICT image of a spreadsheet when asked to Create Publisher. This is not always what is needed. For example, if you wanted to chart some Excel data in another product, you could not use a picture of the data; you would need the data itself.

In order to use published Excel data in ClarisWorks or ClarisImpact, you will need to set some options in Excel:

1) In Microsoft Excel, select the data you would like to publish
2) In the Edit menu, select Create Publisher...
3) Click the Options button to see the Publisher Options window
4) In the ÒEdition Contains TEXT andÓ box, uncheck PICT, TIFF and RTF
5) Click OK, then Publish
6) In ClarisWorks or ClarisImpact, create a Spreadsheet, Spreadsheet frame, or a table
7) With a table or spreadsheet cell selected, choose Subscribe to... from the Publishing submenu in the Edit menu.
8) Select the Edition file created by Excel. You will then see the Excel data, and you can base calculations or charts on the data.

Remember: If you make a change in your Excel data, you must Save before the updates will be sent to the subscribing program(s).

(Excel 4.0 was used for the above description. Other versions of Microsoft Excel may vary.)

Updating Fonts When Installing ClarisImpact 1.0v4

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The following is from the ClarisImpact 1.0v4 Important Information file:

The installer includes a custom install option to update the fonts included with previous versions of ClarisImpact.

If you are updating from ClarisImpact 1.0v3 or earlier, we recommend running this installer option. The fonts provided with this version of ClarisImpact are "Harmonized." This means that the Roman type face (ex:BernhardMod BT) is marked so that it knows about its Bold (BernhardMod Bd BT), Italic (BernhardMod It BT), and Bold Italic (BernhardMod BdIt BT) counterparts.

Once the fonts have been updated, the Bold and Italic versions of the fonts are no longer displayed in the Font menu. However, because the font names have changed, updating these fonts may cause uninstalled font alerts in documents created by other applications. To update the Fonts:
1) Select the Customize option in the Installer window.
2) Scroll down the list of installer options and select the appropriate ClarisImpact Update Font item for your current system.

3) Click install.

The installer will replace the old fonts with the new ones. This version of ClarisImpact will automatically update the old font information in ClarisImpact documents, styles, and libraries when these documents are opened and saved.

Using All Flow Chart Styles with ClarisImpact 1.0v4

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The following is from the ClarisImpact 1.0v4 Important Information file:

The 'ClarisImpact Color Styles' and 'ClarisImpact B&W Styles' folders contain a second set of Flow Chart files located in the folder named 'Full FlowChart Styles'. These files contain the same Basic and Computer Network model and element styles that are in the first set of files and include the rest of the style families - Business, Deco, Informal, International, Modern, and Traditional. To use these styles, replace the 'FlowChart Symbols' and 'FlowChart Style' files in the 'ClarisImpact Color Styles' or the 'ClarisImpact B&W Styles' folders with the files in the 'Full FlowChart Styles' folders. Note: If you have customized the original files with your own styles, rename or make a copy of them before they are replaced.

ClarisWorks: What To Do With Leftover Folders After Upgrading

Helpful hints on cleaning up your system after upgrading.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you have upgraded to ClarisWorks 4.0, here are some helpful hints about removing older versions of ClarisWorks:

1) If you are sharing files with someone who has a previous version of ClarisWorks, their version will not open files converted to ClarisWorks 4.0. (There will be translators available in the fall.)

2) You may remove older versions of ClarisWorks by simply taking their folders, and placing them in the trash.
A WORD OF CAUTION: Do check the contents of your previous versions of ClarisWorks folders before placing in the trash to ensure you do not have any documents in those folders which you may want to keep. For those users who have Performas, ClarisWorks 2.1 is located in the applications folder of your hard drive.

3)If you are using Launcher, you may want to remove the alias for older versions of ClarisWorks. To do so, go into the System folder of your hard drive and remove the alias from Launcher items.

Auto-delete the Contents of a Field

A method for erasing field contents across a group of records

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

It is possible to erase the contents of a field across all records. This process is triggered manually, and using a macro, it is followed through automatically.

For example, after selecting the records for a mailing and having printed the corresponding labels, you may want to erase the identification character typed in the field called "Mailing." To accomplish this task, you create the following macro.

The steps for creating this solution with the ClarisWorks application for the Macintosh are as follows:

1. Click in the Mailing field in the first record.

2. Using the keyboard shortcut command, Shift-J, create a macro called "Erase Field Contents."

3. Type Command-A to highlight the contents of the field and click on the Delete key. Then click on the mailing field in the next record by typing Command-Return. Continue by typing the keyboard shortcut to trigger the macro (Command-Shift-J). End recording the macro.

To use the macro, simply click in the mailing field for the first record to erase and launch the macro using the keyboard Shortcut. Type Command-Period to stop the macro once you have reached the last record selected.

In ClarisWorks for Windows
Follow the same steps as for the Macintosh. The following keyboard combinations: Command-Shift-J is Shift-Ctrl-J.macro, delete, erase field

Claris Works: Error in Calculation That References a Pop-up Menu (Value List)

ClarisWorks 4.0 for Macintosh does not properly evaluate calculations that are based on items in a value list.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Creating a calculation field in order to display a pop-up menu field will yield the position of the selection rather than the selection itself. For example, assuming a Popup Menu field named FieldOne with the following items in the list:

Three
Two
One

A calculation field resulting in text with the formula ='FieldOne' will show a result "1" if Three is selected from FieldOne, a "2" if Two is selected, and a "3" if One is selected.

The workaround is to force ClarisWorks to evaluate the result of the calculation as text by using a text function in the formula. For example, a calculation field resulting in text with the formula =CONCAT('popupmenuone',"") will yield the correct results.

Quick Help Error in HLOOKUP (Horizontal Look Up) ClarisWorks 4.0 Macintosh

How to make the sample spreadsheet work correctly

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

The ClarisWorks 4.0 QuickHelp description for HLOOKUP (Horizontal Look Up) has an error in the sample spreadsheet. The last line shows that =HLOOKUP (A8,A1..E3, 1,0) would return the value 55. Since the lookup value in A8 was "F", and there were no F's in the data, the formula would have returned #N/A!

If the lookup value is changed from "F" to "E" in cell A8, the result of 55 will be correct.

Word Count Causes System 7.0 Through 7.0.1 Macintosh Computers to Crash

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

The Word Count command in ClarisWorks 4.0 does not work properly on Macintosh computers running System 7.0. through 7.0.1. Attempting to execute a word count will cause the machine to crash. In addition, the shortcuts for converting text to all uppercase and all lowercase do not work.

At the present time, the only solution is to upgrade your Macintosh to System 7.1 or higher.

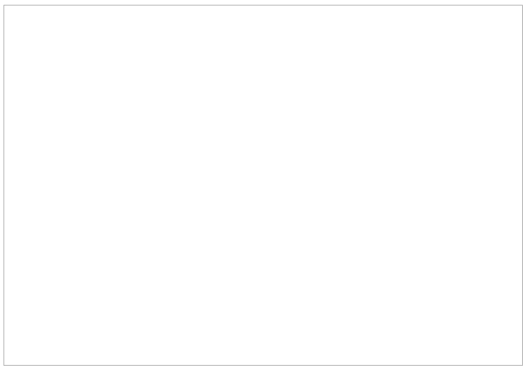
Published Date: Feb 18, 2012

ClarisWorks 4.0 is WorldScript Ready

To take advantage of WorldScript support in ClarisWorks 4.0, it is important to be aware of a few interface considerations.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.



WorldScript is the Apple Macintosh technology that allows more than one script system to exist in the System at the same time. It is available for System 7.1 or later. All localized non-Roman script systems have WorldScript installed. The new ClarisWorks 4.0 software supports language scripts that are left-to-right; scripts that read right to left, such as Arabic or Hebrew, are not supported.

What is a script?
A script is a set of characters and the numeric codes used to represent them. Keyboards, input methods (for scripts like Chinese and Japanese), and fonts are technologies that support character input and output, so they are associated with specific scripts. In effect, a script can be viewed as the combination of fonts, keyboards, and input methods that are defined for it. As a result, if you change the font of a text selection in one script to a font belonging to another script, the character codes will be interpreted incorrectly and will possibly display as a string of gibberish. However, this is true only for characters in the Extended ASCII range (codes 128–255); ASCII characters, e.g., letters of the English alphabet, Arabic numerals, and the basic punctuation symbols, are common to all scripts and therefore will not be transformed by font changes. (See Figure 1.)

Language Kits
The Japanese and Chinese Language Kits add two-byte script capabilities to any System 7.1 (or higher) Macintosh operating system. These language kits include fonts, an input method, script resources and Apple WorldScript II.

How Does the Japanese Language Kit Work?
Let's examine a typical case of a U.S. System being used with the Japanese Language Kit. When you launch a Japanese localized application on the U.S. System, the Primary Script changes from Roman to Japanese as you use the different font and character sets. Let's say that you are using a Japanese application and its document window is currently active. The menus and dialogs will display in the Osaka font, the Japanese System font. If you were to switch back to the Finder at this point, all of your menus and dialogs would display in the Chicago font, because the Primary Script is Roman for the System and Finder. The effect is like having two different Primary Scripts, each activated depending on the application currently running in the front.

Language Register
Each Language Kit comes with a copy of the Language Register. By default, ClarisWorks uses the Roman script as its Primary Script, and all menus, and most dialogs, use the Chicago or Geneva font to display text. This means that in many dialogs, only English or European (Roman script) text are supported, unless you use the Language Register application.

When an application is launched on a System with a Language Kit installed, you can select your desired primary language script for your application. The Primary Script determines the font of all menus, dialogs, and other User Interface elements belonging to that application. If the correct font is not displayed, you can correct this by using the Language Register. It is recommended that you register ClarisWorks with the Language Register before attempting to use the WorldScript functionalities. By registering an application with the Language Register, you are forcing the Primary Script to be the same as the script set in the Language Register. To set the current script in the Language Register, launch the Language Register utility and choose a script from the pop-up menu. Then quit the Language Register utility, and simply "drop launch" the application you wish to register on top of the Language Register icon.

For example, if you want to name fields within your database, you go to the Define Fields dialog in the Database environment. Without first using the Language Register to change the Primary Script, you will be able to type field names in only the Roman script. If you want to enter field names in Japanese, you can register your application as Japanese with the Language Register. You will then be able to type field names in the Define Fields dialog using Japanese characters. With the change of the Primary Script to Japanese, the menus and dialogs now appear in the Osaka font instead of Chicago. However, you will also be able to type English text, because the lower ASCII characters also exist in Japanese script.

Unfortunately, extended ASCII characters, such as accented characters used in French, require the Primary Script to be Roman in order to display properly in the Define Fields dialog. These characters will not be available for field names if you change your primary script to Japanese.

Setting WorldScript Preferences

The Preferences dialog in ClarisWorks 4.0 allows you to select WorldScript preferences, such as the default font and sort order. The sort order choices are limited to those options installed in your System. The WorldScript panel does not appear unless the application is running on a WorldScript-enabled System. This includes any System using the Japanese, Simplified Chinese, or Traditional Chinese Language Kits, as well as any non-Roman localized Systems, versions 7.1 or greater. (See Figure 2.)

Default Font Preference
If the current font and Primary Script do not match, ClarisWorks 4.0 still prevents gibberish characters from displaying when you type. For example, if you begin typing in Japanese but the current font of the insertion point is not a Japanese font, then the Default Font for Japanese from the WorldScript Preferences dialog is used. To choose a new Default Font for a particular script that is installed, you select the script in the list then choose a font from the pop-up menu below the list. The contents of the pop-up will contain all the fonts for that script currently installed in your System, and will change when you select a different script in the list.

WorldScript support in the ClarisWorks environments
Depending on the environment, WorldScript functionality is consistent with the interface of that environment. Following are the highlights of ClarisWorks WorldScript support.

Spreadsheet
The Spreadsheet can handle only one font setting per cell, and it is therefore impossible to enter text in more than one script in the same cell.

Database
When defining fields in the Database, only one script (the Primary Script) can be used for field names. You can change the Primary Script by using the Language Register (see above). The Roman script is the default Primary Script and therefore field names can be defined in Roman text. (e.g., English, French, Italian, etc.) without changing anything.

Database fields can contain text in multiple scripts, just as text frames can. When entering text into a field, all scripts installed in the user''s System are available. Find/Change in the Database is also Multi-script savvy. For example, the cedilla (□) character is used as part of many different two-byte characters in the Japanese script, but if you try to find all records with the cedilla in a field, then no records with Japanese characters will be found, even if they contain the cedilla character code as one half of a Japanese character. The Match Records and Calculation Field dialogs cannot display text in a script other than the Primary Script set by the Language Register application. If you have a database with Chinese data, ClarisWorks should be registered as a Chinese application to correctly display Chinese text in those dialogs.

Because Match Records uses only the Primary Script in its dialog box, it performs a straight byte-comparison of the data in the database, and therefore is not strictly WorldScript-savvy. In other words, it will find records without looking at the script of the data in the fields being searched.

The functions used in a Calculation field will work properly with data in any script. However, any data entered in the dialog [e.g., Left("Field1", 1) = "□"] will be compared byte-by-byte with field data, and this will not reflect any script information. Therefore, if you are using mixed data in several different scripts, only the Primary script will be used to display text in the Calculation Field dialog. Sorting and finds, matches, or calculations that use symbols like "<" will follow the sorting rules from the WorldScript Preferences panel. (See Figure 2.)

Communications
The Communications Module does not support WorldScript or two-byte characters.

Word Processing
ClarisWorks is WorldScript-compatible in the Word Processor and text frames and therefore can handle text in all left-to-right scripts without modification.

A note about special functions
Document Word Count
Some languages do not have spaces between words, so the word count feature has been modified to count contiguous runs of characters of the same type as a word. For example, a Japanese sentence with some Kanji, then some Hiragana, then Katakana all in a row would result in a count of three words, one for each contiguous run of a particular character type, even though there are no spaces between any of the characters.

Character count returns the number of characters correctly, whether counting two-byte or one-byte characters.

Spelling
Roman letters exist in both one-byte and two-byte forms, and both will be spell-checked correctly. Multi-script text is supported in the Replace field of the Speller dialog.

TA43355_ClarisWorks_is_WorldScript_Ready.pdf

Sorting

You may be interested in sorting your data using two different language scripts. The "Sort Order" pop-up menu contains all the sort orders installed in your Text Control Panel in the System Folder. These extra sort orders are included with the Language Kit and are automatically installed together. Only one Sort Order may be used at a time, and the current Sort Order will determine how sorting of Database and Spreadsheet data occurs in all open documents. For this reason, ClarisWorks cannot correctly sort text from more than one non-Roman script at a time (e.g., Japanese and Chinese). If a database or Spreadsheet cell range has mixed Japanese and Chinese data, it is recommended to divide the data into similar sections and sort them separately, changing the Preferences each time.

Ready for WorldScript

ClarisWorks 4.0 is WorldScript-ready, which means that it supports multiple languages, scripts and Apple Language Kits, enabling you to integrate two-byte characters using Chinese, Korean and Japanese text within your multilingual documents. Keeping the above interface considerations in mind, you can take full advantage of the WorldScript functionality available to you in the various ClarisWorks environments.

Difficulty Installing ClarisWorks 3.0 for Windows On a Compressed Drive

How to remove WIN32s from your system so that ClarisWorks can be installed

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

When installing ClarisWorks 3.x onto a system that is using Stacker 4.0 (or other compression utilities), the ClarisWorks installer will not recognize the "stacked" or compressed drive letters and will only give the option of installing to the uncompressed drive letters of the system.

This seems to be an incompatibility with other versions of WIN32 and Stacker 4.0. If there is an version of WIN32 on the system and you get errors trying to install ClarisWorks, remove it and reinstall ClarisWorks starting with disk #1. Once the version of WIN32 that comes with ClarisWorks is installed it should allow the install program to recognize the "stacked" or compressed drives and installation can continue as expected.

Here are the steps needed to remove a preexisting version of WIN32 from your system

1. Remove the following line from the 386 Enhanced [386Enh] section of the SYSTEM.INI file:

DEVICE=<WINDOWS>\\<SYSTEM>\\WIN32S\\W32S.386

where <WINDOWS> and <SYSTEM> are the locations of your WINDOWS and SYSTEM directories, respectively. In a normal Windows configuration the line will read:

DEVICE=C:\\WINDOWS\\SYSTEM\\WIN32S\\W32S.386

2. Modify the following line from the [BOOT] section in the SYSTEM.INI

DRIVERS=MMSYSTEM.DLL WINMM16.DLL

the change should read as follows (remove WINMM16.DLL):

DRIVERS=MMSYSTEM.DLL

3. Delete the following files from the <WINDOWS>\\<SYSTEM> subdirectory or from the SYSTEM directory in network installations:
W32SYS.DLL
WIN32S16.DLL
WIN32S.INI

4. Delete all the files in the <WINDOWS>\\<SYSTEM>\\WIN32S subdirectory or the <SYSTEM>\\WIN32S subdirectory in network installations. Then delete the WIN32S directory itself.

The above changes will take effect the next time Windows is started.

ClarisWorks 4.0: Spelling Checker Changes and Features

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

There are several new features available in the new "world-ready" speller that were not in the previous spelling checkers. The spelling checker now supports Japanese and other non-Roman scripts. However, it still does not support Arabic or Hebrew. In Japanese applications, the spelling checker works on all Roman text, whether it is one-byte or two-byte (Romanji). It skips over all two-byte Japanese text (Kanji, Hiragana, and Karakana) when spell-checking a language written in the Roman script. If you are checking a document and the speller finds a misspelled word, you now have the option to change the spelling of a misspelled word by replacing it with a text string made up of characters frommultiple scripts. For example, you can replace misspelled text such as "rennew" with a Kanji character. You can type Roman characters while in the Japanese font, and they will be spell-checked correctly.

If a Japanese font is used within the document, the context window will display the Japanese font. Each individual character in the context window appears in the font used for that character in the document. (See Figure below.)

HTML Primer Version 1.5.1 (Included With ClarisWorks 4.0) - Part Two

This is a copy of the HTML primer that comes with ClarisWorks 4.0 for Macintosh. (Technical Details)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Technical details

This section describes some of the details of the HTML tags used by the translator.

Character formatting HTML has two kinds of text styles, logical and physical. Logical styles are interpreted differently by different browsers. For example, the logical style (that is, ÒemphasisÓ) may be represented as red single underline by one browser and italics by another. Other examples of logical text styles are and <cite>. Physical styles, such as italic, underline, and 11, 12, or 13 point bold, are represented as typed. When you format text as italic, underline, or 11, 12, or 13 point bold, the ClarisWorks HTML translator tags these physical character styles with logical character styles, like this:

These types of characters Are assigned this HTML tag

Italics <cite>

Underline

Bold (11, 12, or 13 point only)

Note If bold text is any size except 11, 12, or 13 points, the translator tags it as a header. See ÒHeaders,Ó below.

International characters The translator supports most of the ISO Latin 1 character set standard on both export and import.

Special characters Some characters (< > & ; and /) are used in HTML tags. If you type the characters <, >, &, ; or /, the translator interprets them as typed. If you want the characters to be interpreted as part of HTML tags, style the tags as literal text. See the section ÒLiteral text.Ó

Paragraphs and carriage returns The translator tags as a paragraph (<P>) any text followed by a hard return (created by pressing the Return key). The translator tags as a break (<BR>) any text block followed by a hard return that is formatted by placing the insertion point in the text, choosing Paragraph from the Format menu and then setting Space After to 0 (zero).

Headers A header is a logical style. The size depends on the type of header. Browsers usually insert white space above and below the header and display headers as bold.

If a text is bold, the translator checks the font size and then tags the bold text according to these rules:

If the bold text is this size The translator tags the text as

Greater than or equal to 20 points <H1>

Greater than or equal to 18 points and less than 20 points <H2>

Greater than or equal to 14 points and less than 18 points <H3>

Greater than 10 points and less than 14 points

Greater than 9 points and less than or equal to 10 points <H5>

Less than or equal to 9 points <H6>

Lists For each list level, the translator inserts the tag <OL> for an ordered list and <UL> for an unordered list. For each list item, the translator inserts a list-item tag (<LI>).

Horizontal rules If underscores begin and end with a hard Return, the translator inserts the <HR> (horizontal rule) tag in the HTML document.

About this HTML translator

The HTML translator included with ClarisWorks 4.0 represents the joint efforts of Claris and a dedicated team at the Highly Interactive Computing Project (Department of Electrical Engineering and Computer Science) at the University of Michigan in Ann Arbor.

Claris would like to express its thanks to the Highly Interactive Computing Project, including:

Brian Sullivan

Ryan Day

Sean DeMonner

Jeff Spitulnik

Amanda Pryor

Edward Andrews

Craig Braman

Elliot Soloway

International Formatting Support

Claris Organizer has support for the metric system and general formats used by the international customer.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

The Claris Organizer software personal information manager has had a good reception in the United states and is now becoming available in more and more countries, as part of its localization plan. While small and powerful, it also includes features that have been developed to support the needs of international customers. Below is a sampling of these features:

Measurement system
The measurement system featured in
Claris Organizer now supports the metric system.

Number formatting
The decimal separator that Claris Organizer uses is the one set in the Numbers Control Panel.

Week Start
The first day of the week in the Agenda is automatically set to Monday in European versions.

Addresses
The fields on Contact and Note cards generated in Claris Organizer now display the address fields in the right size and position for the addressing conventions in the countries for which Claris Organizer has been localized. The Copy Special command and print formats also use the correct address format. For example, the French version of 1.0v2 has the Postal Code (CP) before the city. See the listing below for the countries for which Claris Organizer has been localized.

Telephone numbers
Claris Organizer users can specify their own phone number formatting. The "Edit ListÉ" at the bottom of the telephone pop up menu in the Contact Preference allows the user to type in something like "(#) ### - ####" if they want a phone number formatted as (3) 456-9874.

Phone numbers that begin with a plus sign (+) are not formatted, they are treated as international phone numbers. It is assumed that international numbers will have a different format than local ones, and Claris Organizer users are expected to enter all formatting characters.

International telephone dialing
The International Prefix in Contact Preferences is dialed when a number begins with the plus sign (+). This prefix should be the international access code for the current country. The rest of the number is assumed to include the country code, city code and subscriber number.

Note: The city code should be entered in the form that is appropriate for international dialing. Usually, the leading zero should be omitted.

While Claris Organizer continues to have a successful reception in the United States, plans are underway to add localizations. The Claris Organizer Development Team is actively pursuing new ways to accommodate the international customer.

Localized versions
Claris Organizer 1.0v2 has been localized for the following countries:

United Kingdom
Canada (also available in French Canadian)
Australia
France
Germany

Please check with your Claris software dealer for details on ordering.

LaserWriter: Recycled Paper Specifications

With the use of recycled paper becoming more of an issue, has there been any testing done on its effects on the Canon LaserWriter engine? How is the paper graded, and what can we advise users to ask their suppliers for to ensure that the paper works with the LaserWriter?
This article has been archived and is no longer updated by Apple.
There are a number of specialized tolerances associated with paper used in the LaserWriters. Although no specific tests have been done on recycled paper, the following specifications must be met for the paper, recycled or not, for paper to work properly:

Poundage tolerances = 16-35 lbs. with Manual Feed; 16-24 lbs. with Paper Tray.

Coating and grain are not specified individually, but the final smoothness, which includes the long-grain requirement and any coating, should fall into the range of 100-300 Sheffields.

The end result should be a paper, including any coating, that does not scorch or melt at 200 degrees C for 1/10 of a second.

International Language Packs for ClarisWorks 3.0 for Windows

International language packs for ClarisWorks 3.0 for Windows support French, German, Spanish, U.K. English, and U.S. English

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
International language packs are available for ClarisWorks 3.0 for Windows software in the following languages:

* French
* German
* Spanish
* U.K. English
* U.S. English

International language packs for Windows are to be used with Claris 32-bit Windows applications. ClarisWorks 3.0 for Windows is the only 32-bit Windows application that Claris is currently shipping.

Note: International language packs for Windows are not suitable for use with ClarisWorks 1.0 for Windows or FileMaker Pro 2.0 for Windows, since they are 16-bit applications.

How to install international language packs for Windows
There is no special installation programs for the dictionary files included in the international language packs. Copy the dictionary files directly from the international language packs disk to the Claris directory on your hard disk using any Windows file copying function. The customary path name for the Claris directory is:

\\windows\\claris

Dictionary types are distinguished by their file extension:

*.msp indicates a main spelling dictionary

*.chy indicates a hyphenation dictionary
*.mth indicates a thesaurus

How to select and use international language packs for Windows

1. Launch ClarisWorks 3.0, and open a document.
2. Choose Edit-Writing Tools-Select Dictionaries from the menu. The Selection Dictionary dialog box will appear.
3. Use the pop-up menu at the top of the dialog box to specify the dictionary type desired.

Choose	To
Main Dictionary	Install a main spelling dictionary
User Dictionary	Install a user spelling dictionary
Hyphenation Dictionary	Install a hyphenation dictionary
Thesaurus	Install a thesaurus

4. Select the dictionary file for the desired language in the Open dialog box. By default, the dictionary files are located in the \\windows\\claris directory.
5. Click Select; then click Done to return to the document.

ClarisWorks 3.0 will now use the dictionary you have selected to perform the corresponding function (spell checking, hyphenation, or thesaurus look-up).

Localized Updaters

Update your localized version of Claris software with the correct version of the updater.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Localized updaters work only for applications in the same language. Practically speaking, this means you cannot update a French product with a German updater.

How an updater works
An updater works for specific versions of an application. You will want to consult the chart (see Figure 1) to see what versions apply to you. The update is a two-step process. In the first step, you update the application. In second step, you update the file translators. Once your update is complete, you can throw out the older version of the application. However, before running an updater, be sure you have addressed the following issues:

Virus detection software
The updater makes several changes to the application. Many virus utilities may prevent these changes and therefore prevent a successful update of your software. To avoid this inconvenience, disable all virus detection software and restart your Macintosh before running the update. The easiest way to do this is to restart your Macintosh with the Shift key held down, holding it down until the "Extensions Off" message appears in the Welcome to Macintosh dialog box.

Hard disk space
For this installation to be successful, be sure that you have enough free disk space on your hard drive. It is recommended that you have ten megabytes free for every 100 megabytes on your hard disk. Many updaters may take up to a full megabyte of space on your hard drive.

How to update an application
Here are the steps for running an updater:

1. Double click on the icon for the Updater application.
2. Click OK.
3. The Updater will attempt to find your copy of the application that you want to update. If the Updater fails to find it, you will be prompted to locate and select your current version of that application.
4. Click Update.
5. You will then get a status bar showing that the application is being updated. When it has finished, you will see a dialog that indicates a successful update has been performed. Click OK to continue.
6. From the desktop, go to the folder that contains the application. You will find your original program and the new version, which will be labeled with the newer version of the application.

7. To ensure that the updater worked correctly, double-click on the application just installed. If successful, quit the application and return to the Finder.
8. If your original application was not automatically deleted for you, place your original application in the Trash and choose Empty Trash from the Special menu in the Finder.

How to update the translators
As part of a regular update, you will also need to update your existing Claris application Translators file. To replace this file, follow these steps:
1. Open the System Folder on your hard disk.
2. Locate and Open the Claris folder.
3. Copy the new application Translators file from the updater diskette into the Claris folder; respond OK when asked whether to Replace the existing file. Note: be sure not to copy this file into the Claris Translators folder. If you do, the import/export capability will not work. The standard installation of the Claris application places the Claris application Translators file in the Claris folder. If you have done a custom installation, this file will either be in the System Folder or in the same folder as the application. If this is the case, locate the file and replace as directed.

A note on FileMaker Pro European Updaters
There is a corrected version of the Read Me file for the FileMaker Pro Updater 2.1v3. A change was made to point #7 in the Read Me file, which now reads as follows: If you are sharing databases on an AppleTalk network, copy the FileMaker Network file included with the Updater into the Claris folder. The Claris folder should be located inside your System Folder.

If you are sharing databases between PCs and Macintosh computers on a Novell network, copy the FileMaker Network file included with the Updater (in the MacIPX Updater folder) into the Claris folder. If you are asked to replace a file with the same name, do so. The MacIPX control panel should be put into the Control Panels folder inside the System Folder. The other MacIPX files (MacIPX Token Ring, MacIPX AppleTalk and MacIPX Ethernet) should be put into the Extensions folder inside the System Folder.

TA43364_Localized_Updaters.pdf

Where the updaters are
You can locate the updaters online at the following Internet ftp site:

ftp://ftp.claris.com

Log in as "anonymous."

Obtaining High Resolution With Rotated Text

Rotated text is changed to a 72 dot per inch bit mapped image. Higher resolution can be achieved by creating the text in a paint document at 4 times the desired font size and pasting it in as an object and changing the frame resolution to 288 dpi.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
When text is rotated, it is converted to a 72 dot per inch bit mapped image. This looks very poor when printed on any high resolution printer, including PostScript printers printing at 300 dots per inch (dpi) and QuickDraw printers such as the StyleWriter which prints at 360 dpi.

A high resolution version of the rotated text can be created by typing the text in a paint document at 4 times the desired font size. Copy the text from the paint document and paste it into the draw or database document. Select Modify Frame from the Options menu and change the resolution to 288 dpi. This increases the resolution and decreases the size by a factor of four. The object can now be rotated and positioned. If a rotation of other than 90 degree increments is desired, then rotate the text in the paint document before copying. After pasting into the draw or database document, change the fill pattern to transparent and the line width to none. This will allow other objects to show through the large frame of the rotated text object and remove the black border from around the frame.

Russian ClarisWorks on non-Russian Operating Systems

To run Russian ClarisWorks on non-Russian Operating Systems, your system must be running the WorldScript I Extension and the fonts and keyboard supported by the language

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The Russian ClarisWorks software can be used on different operating systems (including the U.S. operating system) if you have the following:

* Language Supported Keyboard
* Language Supported Fonts
* WorldScript I Extension

The three items listed above enable the U.S. system to accept Cyrillic characters and use Cyrillic fonts.

U.S. ClarisWorks on non-U.S. operating systems
U.S. ClarisWorks will work on a localized operating system as long as the above three items are installed.

Considerations when running an application on a different system:
As is the case with running on two different systems, character mapping will differ when you work with any version of ClarisWorks on systems with different character encodings, even when you can type Cyrillic characters and use Cyrillic fonts. Depending on how a particular character on a system is mapped to another character on a different system, there could be instances where a letter in the alphabet will be mapped to a punctuation character and vice versa. Therefore, things like word selection (double-click) won't work properly, because the punctuation character (such as comma or period) in the U.S. ClarisWorks could be mapped as a letter character on the Russian system. So, when you double-click, ClarisWorks is only going to select up to that letter character for the same reason that it only selects up to a period or comma had one double clicked on a U.S. system.

System 7 Tune-Up, System Update 3.0 and ClarisWorks 4.0

An explanation of the recommendations made on page 1 of the ClarisWorks 4.0 Installation Guide

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
On page 1 of the ClarisWorks 4.0 Installation Guide, it states that System Update 3.0 is recommended for customers using System 7.1, System 7 Pro (System 7.1.1), or System 7.1.2, and that System 7 Tune-Up 1.1.1 is recommended for customers using System 7.0 or System 7.0.1. This information is included only as helpful advice on how to get the best performance and reliability from your Mac OS computer.

These tune-ups address many system-level issues that relate to memory, file storage, speed, and printing that can affect any of the programs that you use on your Macintosh.

Although neither of these updates are officially supported by Apple Computer, Apple Computer continues to make them available for download both via the Internet.

If you have Internet access, use your World Wide Web browser to access the following URL:

http://www.info.apple.com/cgi-bin/lister-pl?Apple.Support.Area/Apple.Software.Updates/US/Macintosh/System

If you prefer, these files may also be retrieved via anonymous FTP from ftp.info.apple.com.

In addition to the updates mentioned in the ClarisWorks 4.0 Installation Guide, Apple Computer has also made an update available for users of System 7.5. This update is called "System Update 1.0 for System 7.5" and is also available from the above-mentioned services.

Exchanging ClarisImpact 2.0 Files Between Macintosh and Windows

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

ClarisImpact 2.0 for Windows has the same file format, user interface, and features as ClarisImpact 2.0 for the Macintosh. You can create a ClarisImpact document on Windows and edit it on a Macintosh computer, or vice versa. Therefore, if you work with both Macintosh and Windows versions of ClarisImpact, or if you collaborate with colleagues who use ClarisImpact 2.0 for Macintosh while you use ClarisImpact for Windows, you can work without translating files or learning a different program.

However, if you want to transfer files between platforms via diskette, you must use a file transfer program such as PC Exchange, AccessPC, or a similar utility that lets you create and use PC- formatted diskettes on a Macintosh. These utilities require that your Macintosh have a high density drive (FDHD SuperDrive). Follow the directions in the documentation of the file transfer utility program.

After copying the files to or from a PC-formatted disk, it may be necessary to rename the files. When sharing files with systems running Windows 3.1 or Windows for Workgroups 3.11, make sure that your ClarisImpact filenames follow DOS filename conventions (8 characters or less) and end with the .CID extension. (For ClarisImpact Library files, use the .CLB extension.)

When you use a multi-platform server (such as Novell Netware) to transfer files from Macintosh to a Windows computer, you can use a ClarisImpact file right off the server. No file transfer program is required.

Fonts, margins, page breaks, and some graphics might display differently when transferred between Macintosh and Windows. You might have to adjust the margins and page breaks in the transferred file to restore the original appearance.

You can minimize font problems by installing and using the TrueType fonts that ship with ClarisImpact for both Macintosh and Windows.

Refer to the Important Information (Macintosh) or Read Me (Windows) file that is installed in the ClarisImpact application folder or directory for platform specific information on font mapping.

How the ‘Fit Document to One Page‘ Printing Option Works

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisImpact 2.0 adds a new option in the print dialog, 'Fit Document to One Page.' This option is available only in drawings; it will be grayed out on report (word processing) documents. The purpose of the 'Fit Document to One Page' checkbox is to give a snapshot view of the entire document. It fits the entire document (including white space) to one page, as opposed to fitting the graphic or model to one page.

Example
An organization chart model in a drawing document is set to print in landscape mode, but the organization chart spills over onto the second page to the right by approximately 3 inches. If this document is printed with the 'Fit Document to One Page' option checked, the organization chart prints on one page, but it is considerably reduced and has sizable white space to the right and below the chart.

If there are blank pages or extra blank space in the document, the white space will be even larger, and the graphic smaller. To remove blank pages, choose Document from the Layout menu. Using your mouse pointer, resize the number of pages with the document size box or manually type the number of pages for the document.

To print the organization chart so that it fills one page, consider these options:

1. Resize the model by clicking the selection handles and dragging until the graphic fits on one page.

2. When printing from a Macintosh, you can choose Page Setup from the File menu and reduce the image to less than 100 percent. The reduction option is, unfortunately, not available when printing from Windows 95.

ClarisImpact 2.0: Mac Trial Version Read Me

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Welcome to ClarisImpact 2.0, the complete business graphics manager.

A few important things to know about this demonstration disk:

Some of the features have been disabled in this version of the application. You will not be able to save documents or copy objects to other applications via the clipboard. However, cut, copy and paste will work within the application.

Printing is available, but your printouts will have a watermark in the background.

The "Real Life" CD that was distributed at MacWorld Expo (and other places) includes a ClarisImpact 2.0 Trial version of the software (Located in the DemoWare section). The following is from the ReadMe First! file of that Trial Version:

The demo includes a sampling of the styles and art that are available. The non-demo version of ClarisImpact contains an even greater assortment for you to choose from.

Very Important Information for Claris Customers!

If you own another Claris application, chances are you have a copy of the "Claris XTND System" in your Claris Folder (located in your System Folder).

When you have finished using this demonstration, be sure to throw away the "Claris XTND System" that is included with this disk. While this will not adversely affect the operation of your computer, it is recommended to ensure you will get the best possible performance from your other Claris applications.

ClarisImpact: Installation and Multi-Use from Novell NetWare Servers

Steps enabling you to multi-launch ClarisImpact from a Novell NetWare server

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The following information is from Section E of the Important Information file that ships with ClarisImpact 2.0 for Macintosh:

If you intend to run ClarisImpact as a multi-user application from Novell NetWare servers or perform network installations from an installer located on the server, and you are using System 7.1 or 7.5, then you need to reset the shared bit for the installer and/or the ClarisImpact application. This bit is preset in ClarisImpact, but the setting is cleared when the files are copied to a NetWare server if you are using the system versions named above.

You can reset the shared bit using either of the following two methods:

Method 1
Using the NetWare Tools application, which comes with Novell NetWare for Macintosh:
1. Make sure you have access privileges to change files.
2. Log onto the server.
3. Start NetWare Tools.
4. Select File and Folder Flags from the Utility menu.
5. Select the ClarisImpact Installer, ClarisImpact - Macintosh, and/or ClarisImpact - Power Macintosh that you want to share.

6. Click Shareable.
7. Close the File and Folder Flags window.
8. Quit NetWare Tools.

Method 2
Using ResEdit:
1. Make sure you have access privileges to change files on the server.
2. Log onto the server.
3. Start ResEdit.
4. Select Get File/Folder Info from the File menu.
5. Select the ClarisImpact Installer, ClarisImpact - Macintosh, and/or ClarisImpact - Power Macintosh that you want to share.
6. Click both Shared and Invisible in the Info window.
7. Select Save from the File menu.
8. Deselect the Invisible checkbox.
9. Select Save in the File menu.
10. Quit ResEdit.

"Bad Formula" Message in ClarisWorks (Win), Calculations in FileMaker Pro 2.x Files Translated from Macintosh to Windows

If ClarisWorks or FileMaker do not see the proper separators in the control panel, it is likely the results will not be accurate.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
When entering what looks like a valid calculation using ClarisWorks for Windows 3.x, the system will come back with a BAD FORMULA dialog and will not allow you to enter the calculation into the database or spreadsheet document.

Many functions in ClarisWorks 3.x require more than one parameter to work properly. For example the DATE function requires parameters for MONTH, DAY, and YEAR. When entering in this calculation, ClarisWorks expects that each parameter be separated by a comma (by default).

Example:
Date ('year value','month value','day value')
Date ('95','12','25')

In the INTERNATIONAL section of the CONTROL PANEL, there is a setting for LIST SEPARATOR. The value for list separator is normally a comma. If it is set to anything else, there is a possibility that will affect the entering of calculations within ClarisWorks. If possible, it is recommended that you change the LIST SEPARATOR to a comma, restart ClarisWorks and reenter your calculation(s).

If the LIST SEPARATOR cannot be changed, then it is still possible to create valid calculations within ClarisWorks. To do so, you will need to enter the calculations manually (as opposed to clicking on functions and fields) and substitute the value which is entered in the LIST SEPARATOR with all the commas in your calculation(s). NOTE: This is not recommended and may not work in all circumstances. Using a comma will always assure a valid calculation.

Example:
LIST SEPARATOR = #

An example of valid calculations based on the LIST SEPARATOR being a "#" would be:

Date ('year value'#'month value'#'day value')
If ('Field A' = 'Field B'#'Field C'#'Field D')
Average (2#4#6)

This does not seem to be a problem with ClarisWorks for Windows 1.0

This is also an issue for FileMaker Pro files created on the Macintosh platform and translated to the Windows platform as the different platforms use different separators. Again, the solution will be the same. Set up the separators in the INTERNATIONAL section of the CONTROL PANEL as mentioned above.

Garbage Characters in Global Village Gold II Connection in ClarisWorks Communication Environment

Alternate settings to try if you are getting garbage characters in a communication connection.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Using a Global Village Gold II modem, if you run into "garbage" characters in a ClarisWorks communication connection do the following:

Try changing the Connection Settings Handshaking to CTS only.

If that does not work:

Try setting the modem to 2400 bps while "CTS only" handshaking is still set.

Importing WordPerfect 6.0 (*.DOC;*.WPD Files) Into ClarisWorks 3.0v1 for Windows

ClarisWorks does not show a listing of files of type *.WPD.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
When selecting WordPerfect 6.0 (*.DOC;*.WPD) for the file type to import into a word processing document, in the File entry box, ClarisWorks for Windows 3.0 will put a period at the end of WPD extension. This makes it so ClarisWorks for Windows will not show any '.WPD' files.

To recreate, follow these steps:

Select Open from the File menu.
Click import Option Chevron.
Click radio button for Word Processing.
Select WordPerfect 6.x (*.wpd;*.doc)
FileName box list *.doc;*.wpd.

This has been fixed in the 3.0v2 release of ClarisWorks. To upgrade to the new version you can call Claris at (800)544-8544, or you can download the updater from the ClarisBBS at (408)987-7421 via modem.

To download the updater for ClarisWorks 3.0v2 follow either of the groups of steps below once you are logged onto the Bulletin Board Service:
A.
- From the Main menu type "F" for Files
- Type "I" for Information / Updates
- Type "A" for Claris Product Updaters
- Select the file CLW30V2.ZIP

B.
- From the Main menu type "F" for Files

- Type "D" for Download File
- Type in the file name "CLW30v2.ZIP"

STartFaxing Anomalies with FileMaker Pro 2.x and ClarisWorks

Some important considerations when using these programs concurrently.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The following is an excerpt from: STartFaxing Version 1.1 Release Notes, STF Technologies, Inc., November 1994.

ClarisWorks
If after using FaxMenu you immediately use Command-P to select "Print..." the chosen printer will still be FaxPrint.

Work around: Click in the menu bar once without the FaxMenu keys held down to reselect your original printer.

FileMaker Pro 2.0
The "Settings" button in FaxPrint will not be available unless the [FileMaker Pro] application memory size is increased. Also, using a "Print" button in a layout will not allow the FaxMenu hot keys to work.

Work around: Select Print from the File menu as normal.

[Note: STartFaxing is a lite version of FaxSTF that comes bundled with some modems. - Ed.]

ClarisImpact 2.0v3 Read Me

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

WELCOME TO CLARISIMPACT 2.0v3!

Thank you for choosing the ClarisImpact 2.0 application. We're pleased to provide the ClarisImpact 2.0v3 Update, which addresses known issues since its initial release.

This document provides information about:

I. Installing the ClarisImpact 2.0v3 update
II. Problems and issues addressed in v3

I. INSTALLING THE CLARISIMPACT 2.0v3 UPDATE

Before running the updater make sure all of your computer's System software extensions are turned off. To do this:
1. Save all open files and quit all of the programs running on your computer.
2. Hold down the Shift key on your keyboard.
3. Choose Restart from the Special menu.
4. Do not release the Shift key until the words "Welcome to Macintosh. Extensions off." appear on your screen.

To update the ClarisImpact 2.0v3 product currently installed on your computer:
1. Double-click the "ClarisImpact 2.0v3 Updater" installer icon.
2. Read the Claris splash screen and click OK.
3. The ClarisImpact 2.0v3 updater will automatically search your hard disk (and any mounted volumes) and display a list of eligible files for updating.
4. Click Update. The updater will begin updating the selected application. Once the updater is finished, you have the option of deleting the original 2.0v1 or v2 file. Then click OK to quit and you can begin using the updated version of ClarisImpact.

II. PROBLEMS AND ISSUES ADDRESSED IN 2.0v3

This 2.0v3 Updater addresses the following issue from previous versions:

When attempting to save a file or library to a server volume with 2Gb or more free space, a "Disk is full." error would result.

TA43381_LaserWriter_ROM_Changes_to_Font_Cache_(TIL00566).pdf

LaserWriter 2.0 ROM: Changes to Font Cache

This article has been archived and is no longer updated by Apple.

Operation of the font cache has changed somewhat. Formerly there was a single limit on the number of bytes occupied by a character in the cache; a character larger than that would not be cached. Now there are two cache thresholds, upper and lower. If a character is larger than the upper threshold (as determined by the bounding box specified to 'setcachedevice'), it will not be cached, otherwise it will be. If a character is cached and is larger than the lower threshold, it will be compressed, otherwise it will be stored as a full pixel array.

The two thresholds are manipulated by the new operators 'setcacheparms' and 'currentcacheparms', described below. The old operators, principally 'cachestatus' and 'setcachelimit', remain valid. PostScript programs rarely deal with these operators.

Although they consume much less space in the font cache than full pixel arrays (by a factor of up to 40), compressed characters require more computation to reconstitute when they are needed. Reconstituting a compressed character is still substantially faster than re-executing the original character description. In systems printing at 300 pixels per inch or less (including the LaserWriter), the default lower threshold is set so that characters up to about

20 points are stored as full pixel arrays while larger ones are stored in compressed form. Caching of regular-sized body text occurs with the full pixel array representation which is time-efficient while caching of large characters occurs with the compressed representation which is space-efficient.

Serial NB Card: Multiple Serial Port Support

Can the Serial NB Card be used to add more serial ports?

This article has been archived and is no longer updated by Apple.
The Serial NB Card theoretically gives you four additional serial ports. With the introduction of Apple Remote Access (ARA) MultiPort Server you can simultaneously use all four serial ports on a card.

However, there isn't any other software that uses more than one of these ports at a time. This includes MacX25, and SNA*ps, which cannot coexist on one card. You could continue using the two built-in serial ports with the one additional "external" serial NB port (in conjunction with MacX25 or SNA*ps software), so you could have a total of three serial ports available simultaneously.

Conflict with VISE Installer Causing Excessive Disk Swapping

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
You might find that when you are installing from floppy disks, you are required to do excessive disk swapping. It is often suggested that you restart with extensions off to solve this problem. We believe that the problem is caused by a conflict between the VISE installer and Thunder 7. This problem has been reported in ClarisWorks, FileMaker Pro, and ClarisImpact but may affect others as well.

Thunder 7 is a control panel which allows spell checking any text in any application and is manufactured by Baseline Software.

Workaround, install with extensions off.

How to Insert an EGO Object

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
EGO stands for Equation Graphic Object. An EGO object is an equation from an Equation Editing Program. These objects, when double clicked on, open the Equation Editor, allowing you to edit and calculate equations like those used in Physics, Chemistry, and Math.

There are three ways to insert an EGO object into a MacWrite Pro or ClarisWorks 4.0 document
1. Insert a file that contains and EGO object.
2. Paste an EGO object from the Clipboard directly into a document,
3. Paste or insert an EGO object into a picture frame in MacWrite Pro* or into a graphics frame in ClarisWorks.

*When you paste an EGO object into an existing inline picture frame in MacWrite Pro, the frame is resized and positioned vertically, using the baseline offset information. A negative baseline offset in the picture information produces a frame that extends below the text in the line.

If the existing picture frame is not an inline frame, MacWrite Pro ignores the baseline information.

** This information is on page 5-2 of the MacWrite Pro Installation and new features guide **

Simple Scheduling in ClarisWorks

It is possible in a ClarisWorks spreadsheet to schedule events between pairs of people or teams or items. (This method will work with any spreadsheet program that allows searching by cell references.)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Imagine you have six chess players, Ann, Bud, Cal, Dee, Ely and Fay. Each player needs to play each of the other players once. To be efficient, you want to know who should play whom at any given time to avoid idle players.

1. Start by placing a dash in cell A1. Then list the teams or items below that in column A. Also list the teams or items in the same order across the first row. Repeat the sequence again, for example: Ann Bud Cal Dee Ely Fay Ann Bud Cal Dee Ely Fay.

2. In cell B2, place the following formula:

=IF(B$1=$A2,"-",CONCAT($A2," ",B$1))

Press Return or Enter to accept the formula.

3. Highlight from B2 through M7 (click and hold cell B2, drag to cell M7). In the Calculate menu, select Fill Down, and then in the Calculate menu, select Fill Right.

4. In cell A10, type 0, then number from 1 through 3 in the cells below and to the right of the zero.

5. In cell B11, place the following formula:

=INDEX(A1..M7,$A11*2,$A11*2+(B$10*2-1))

6. Highlight from B11 through D13. In the Calculate menu, select Fill Down, and in the Calculate menu, select Fill Right.

Starting at cell B11, you will then see a list of Òmatch ups,Ó or games that should be played. They can be played in single games (only two players playing at a time) or multiple games (four players, or all six players can play at once.)

In a larger example, if twelve teams are playing, they could play up to six games at once (all twelve teams would be playing at once), or anywhere down to one game (two teams) at a time. By following the schedule, all the teams will play all the other teams in the most efficient way. (Work from top to bottom, from left to right, starting at B11.)

Macintosh SE: How to Determine Different ROM Versions

When the Macintosh SE was introduced, I recall hearing something about the Macintosh SEs being shipped with different ROM versions. What are those differences, if any?

This article has been archived and is no longer updated by Apple.
You are right; there have been two versions of ROMs shipped in the Macintosh SE. The only difference, which also makes the two systems easily distinguishable, is that the systems with Apple SuperDrives (formerly Apple FDHD) have newer ROMs that include support for that drive. Those with 800K drives have the original ROM.

Since the new code in the new ROMs is also used in the new systems, if any incompatibilities exist, they are likely to be related to the SuperDrive code and may very well affect the other Macintoshes with SuperDrives. We aren't aware of any software compatibility problems caused by these new ROMs.

Type 11 Errors in ClarisWorks

There have been reports of customers getting Type 11 errors in both ClarisWorks and WordPerfect. This is a solution that we have encountered in some instances.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The error "11" normally is hardware related but also occurs with System 7.1, the Drag & Drop extension, and various applications.

If you have System 7.1 with this extension and are getting this error, try removing it. See if it goes away. The Drag and Drop extension was an add-on to System 7.1 but is built into System 7.5. Upgrading to 7.5 also reportedly to solves the issue.

Converting Microsoft Works Databases to ClarisWorks (DB) on a Macintosh

Guidelines for converting databases from Microsoft Works to ClarisWorks.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If you are using Microsoft Works 2.0, ClarisWorks (2.0 and 3.0) can read the database in directly. With ClarisWorks launched, select OPEN from the FILE menu, click on Database as the type of document, and then double click the MSWorks DB file. The file will open into a ClarisWorks database. Save it, and use it.

If you are using Microsoft Works 3.0, you must first save your database as a DIF file (this saves the data in a text format, with the field names), under a new name (ie., if file is called "My Database", then you would rename it something like "Import this to ClarisWorks"). Then, with ClarisWorks launched, select OPEN, click Database, and then double click the DIF file ("Import this to ClarisWorks"). The file will open into a ClarisWorks database. Save it, and use it.

Understanding the ClarisWorks Font Menu In ClarisWorks for Windows (1.0 & 3.0)

How to control what appears in the font menu in ClarisWorks

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
ClarisWorks for Windows has a default setting which limits the number of fonts displayed in the Font menu to 22. The type and number of fonts installed on your system is what is initially responsible for determining which 22 fonts appear in the menu. ClarisWorks finds these fonts in the following order: ATM fonts, Windows screen/plotter fonts (MS Serif, MS Sans Serif, Modern, Roman, Script), TrueType, and lastly, printer fonts. So, for example, if you have 22 or more ATM fonts installed on your computer, the ClarisWorks Font menu will display only ATM fonts, regardless of the other types of fonts which may also be installed.

You can add fonts to the menu by choosing the "Other" command at the bottom of the Font menu. If you add a font without increasing the 22-font limit, the font you chose will be added and the least recently used font will be removed. This command can also be used to apply a font not in the menu to highlighted text without adding the font to the menu. This is the recommended procedure for applying a seldom-used font.

The total number of fonts displayed in the menu can be increased by changing the number of the MaxFonts= line in the [ClarisWorks] section of the Claris.ini file to some number higher than 22. This file is normally located in the \\Windows directory and can be opened and edited using Notepad, Write, or any other text editor.

******** WARNING: at approximately 70 fonts, ClarisWorks begins to exhibit erratic behavior. This is due to the functioning of the Windows core file GDI.EXE and the limited nature of its resources. Because of this, it is strongly recommended that this procedure be used only in cases where there is a compelling need to have an increased number of fonts displayed in the menu and that the number of increased fonts be kept as low as possible.

ClarisImpact 2.0 Disk Contents (Macintosh) and Installation Guide

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The ClarisImpact 2.0 High Density Disk Set for the Macintosh (a total of 11 disks) contains the following items. File sizes of individual items are approximate. These are compressed files and will be uncompressed during the installation process.

Disk 1
Install ClarisImpact (1368K)
Important Information (24K)
Developer VISE Moved Items (Empty Folder)

Disk 2
Install ClarisImpact.2 (1376K)

Disk 3
Install ClarisImpact.3 (1376K)

Disk 4
Install ClarisImpact.4 (1376K)

Disk 5
Install ClarisImpact.5 (1376K)

Disk 6
Install ClarisImpact.6 (1376K)

Disk 7
Install ClarisImpact.7 (1376K)

Disk 8
Install ClarisImpact.8 (1376K)

Disk 9
Install ClarisImpact.9 (1376K)

Disk 10
Install ClarisImpact.10 (1376K)

Disk 11
Install ClarisImpact.11 (128K)

You will need approximately 20 Mb of free space on your hard drive to do an Easy Install. When doing an Easy Install, the contents of the disk set will be installed onto the hard disk as follows:

At the root (main) level of your hard drive, in ClarisImpact 2.0 folder (13368K):

ClarisImpact: Cross-Platform Considerations

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisImpact 2.0 for Windows has the same file format, user interface, and features as ClarisImpact 2.0 for the Mac OS. You can create a ClarisImpact 2.0 document on a Windows computer and edit it on a Mac OS computer, or vice versa, without translating files on either platform.

Transferring a file:

Note: After you transfer files from a Mac OS machine to a system running Windows, make sure that your ClarisImpact 2.0 file names follow DOS file naming conventions (8 characters or less) and end with the .CID extension. (For ClarisImpact Library files, use the .CLB extension)

Using diskettes:
To transfer a file between a machine running the Mac OS and a machine running Windows 95, simply insert a PC-formatted diskette into the floppy drive of either computer, drag the document onto it, insert the disk into the other machine, and drag and drop the file to the new machine. The document is ready to use.

To transfer a file from or to a computer running the Windows 3.1 operating system use File Manager.

If you are transferring from a machine running a Mac OS version prior to 7.5, see the TechInfo article "Using Apple File Exchange" and/ or your computer's manual for instructions on transferring files to PC.

Over a network:
You can use a multi-platform server (such as Novell Netware) to transfer files from a Mac OS computer to a Windows computer. You can also use a ClarisImpact 2.0 file directly from the server. No file transfer program is required.

Considerations:
Fonts, margins, page breaks, and some graphics may display differently when transferred between Mac OS and Windows machines. It may be necessary to adjust the margins and page breaks in the transferred file to restore the original appearance. Minimize font problems by installing and using the TrueType fonts that ship with ClarisImpact 2.0 for both platforms.

Refer to the Important Information (Mac OS) or readme.txt (Windows) file that is installed in the ClarisImpact application folder or directory for platform-specific information on font mapping.

MacProject Timeline Charts Paste as Text Only Into ClarisDraw

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When you copy a task or resource timeline from MacProject Pro and paste it into a ClarisDraw document, only text appears, whereas pasting into a MacDraw Pro document yields a complete timeline.

To see this behavior:

1. Launch MacProject Pro.
2. Select Task Timeline or Resource Timeline from the Chart menu and Select All.
3. Copy and Quit.
4. Launch ClarisDraw and Paste into a new document.
5. Notice that only text appears.

The whole chart is pasted into the MacDraw Pro document because MacDraw Pro parses the private scrap type passed from MacProject Pro clipboard . This feature was omitted from ClarisDraw.

Visual Quick Start Tips For ClarisWorks 4.0 Macintosh

Some General tips to make working with ClarisWorks easier the first-time used

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

General

'Cleaning Up' After an Upgrade

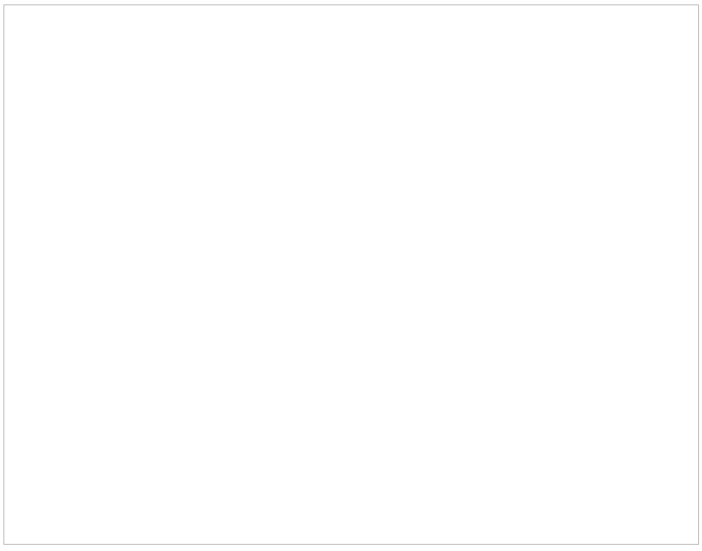
After installing a major ClarisWorks upgrade, such as ClarisWorks 4.0, you may notice that you still have another ClarisWorks folder on your hard drive. The ClarisWorks 4.0 installer places an entirely new version of the program onto your hard drive, so the other ClarisWorks folder which contains ClarisWorks 2.1 or ClarisWorks 3.0 is no longer necessary.

* Very important: On most Macs, when you save a ClarisWorks document, it is automatically saved into the same folder as the ClarisWorks application (unless you specified otherwise). This means that your old ClarisWorks folder(s) may have files that you created that will be irretrievably lost should you throw them in the Trash before making sure that they do not contain personal files. Before emptying the Trash, make sure you do not have personal files in the Trash.

If you use the Launcher (included with System 7.5 and most Performas), ClarisWorks 4.0 will automatically create a Launcher icon for ClarisWorks 4.0 for you. However, it will not remove Launcher icons for older versions of ClarisWorks automatically. To do so, open your System Folder. In the System Folder, open the Launcher Items folder. Then, throw out any icons that point to older versions of ClarisWorks. (Hint: They may be in folders within the Launcher Items folder.

Converting Old Files

Once you have your new version of ClarisWorks loaded on your computer, you can update or convert all your old files immediately by opening them with your new version of ClarisWorks. However, you may just as easily choose not to open all of your files at once, but open your files one at a time as you need them. The conversion of each of your old files occurs when it is opened in the new version of ClarisWorks. By default, ClarisWorks 4.0 will open your old ClarisWorks files when you double-click on them. However, it will not automatically replace the old file with a new file using the new ClarisWorks 4.0 format, but instead keep the old file and save a new file with a name that ends in a [v4.0] suffix (see Figure 1).



If you like, you may change the Preferences in ClarisWorks 4.0 so that you will not be alerted that you are opening an old file, and so that any old file you open will be replaced by a file in the new format. This saves time Ñ no annoying dialog boxes! Ñ and saves space on your Mac, as you won't have two copies of every file you use -- which can certainly be confusing.

To change this, launch ClarisWorks 4.0, and either open a new document or open an existing document. Then, go to the Edit menu and select Preferences. See that the General icon in the list on the left-hand side of the window is selected. If it isn't, select it by clicking once on it. (Hint: You may have to scroll up on the left-hand window to see it) Then, uncheck the following two options on the right-hand side of the window: Old Version Alert and [v4.0] Suffix. Then, click Make Default. Finally, close the Preferences window. From now on, whenever you open an old ClarisWorks document, it will seamlessly convert itself to the new ClarisWorks 4.0 format without bringing up any dialog boxes. This makesopening old files in ClarisWorks 4.0 faster and easier.

Tip: Convert all your files all at once to save time!
For a mass conversion of all your files, you can 'drop launch' the files onto the ClarisWorks icon. To do this, group select or ÒmarqueeÓ (draw a selection rectangle around the appropriate files so that they are simultaneously highlighted, or 'darkened'; see Figure 2). Drag the selected group of document icons onto the application icon for ClarisWorks. You will then see the selected documents you translate in rapid succession. You can then either save the converted documents under new names, in which youÕll have two copies of the document (one old and one converted copy). To have just a single copy of the file, name it the same as the old copy to replace the old copy.

Increase Memory for better performance
Sometimes, you may need to increase the memory (RAM) allocated to ClarisWorks. However, before increasing the memory allocation to ClarisWorks, you'll want to see how much RAM your computer has installed. To do that, select About this Macintosh... from the Apple menu when you are in the Finder. The Window looks like this (see Figure 3):

In Figure 3, the total memory in this Macintosh is 16, 384 K (or 16 megabytes). Of that, 3,989 K are used by the System, leaving roughly 12,000 K that can be used to run applications, such as ClarisWorks. You will want to make sure that the Largest Unused Block number (here 12,332 K) is large enough to accommodate a greater memory allocation (usually 2,000 K) for ClarisWorks.

Once you have made sure that you have the 'memory to spare,' follow these steps to allocate more memory to ClarisWorks:

1. Quit ClarisWorks, if it is currently running.
2. Open the ClarisWorks Folder.
3. Click once on the ClarisWorks Application Icon, just so it is highlighted.

4. Go to the File Menu and choose Get Info. (See Figure 4.)
5. Change the Preferred Size to 2000 K.
6. Close the Get Info box.
7. Restart ClarisWorks.

Automate settings in Each Environment
Do you find yourself changing the font, tabs, page setup and point size each time you create a new document? If you do this regularly, you may want to set up some defaults for each type of document you can create in ClarisWorks. For example, you can 'preset' ClarisWorks to always use your preferred font in all the Word processing documents you create. To do this:

1. Open a new word processing document.
2. Set all the defaults you might want changed (font, font size, page setup, tabs, etc.).
3. Choose Save As under the File Menu.
4. Save the document as ClarisWorks Stationery with the name 'ClarisWorks WP Options.'
Make sure the file is saved to the Claris Folder inside the System folder.

All new WP documents will come up with the defaults you set in your ClarisWorks stationery document. Check your online help in ClarisWorks, under the keyword 'stationery' for more uses of stationery documents for automating your work flow.

Use the Draw environment for Complex Documents
Many times with complex documents like newsletters, posters, and party invitations, the first impulse is to create the document in the Word Processing environment as it will contain a good deal of text. However, it is often much easier to do this type of 'page layout' work in the Draw environment. In the Draw environment, you can more freely place and resize text blocks, use all the draw tools, work with other types of frames, and link text boxes using the Frame Links command.

Keep work in a safe place
Your ClarisWorks files are often important to your business, your home finances, or your personal correspondence. You can probably think of many more good reasons to make sure you have a safe copy of your files. Floppy disks are not as reliable as your hard drive, so if your primary copy is on a disk, make frequent copies to your hard drive. If your hard drive currently contains the only copy of many important files, you may want to back them on to floppy disks, lock the disks, and put them away in case of an emergency.

Reverting to saved and Undo
When you edit one of your files, and moments later find that your change seems like a terrible mistake, remember that you can almost always undo your mistake. First try going to the Edit menu and choosing that first option, Undo. This can save you some from experiencing a late night disaster. However, be aware that the Undo command works on a very immediate level. You can, foe example, undo or redo typing, and depending on when you did your last save (whether it was minutes ago or hours ago), undoing your typing could mean undoing paragraphs (if you haven't saved in hours) or undoing words or sentences (if you haven't saved in minutes). The 'industrial strength' Undo command is the Revert command, which allows you to 'go back' to the previously saved version of your document. When you use this command, be aware that the good and bad work is lost, almost as if you had never even done anything after your last save.

See it as it really is

In spreadsheet, paint, draw, and database, the view you get on screen is not always the way the file winds up printing. Under the View menu, try turning on Page View. The page breaks and document margins will then show you a more accurate view of what the final printed version may look like. This is especially important for spreadsheets, as any row or column that will not fit completely on the page gets pushed to the next page.

Word processing

Use Tabs Over Spaces
For professional looking documents, avoid using spaces to set indentations in blocks of text or at the start of new paragraphs and separate text sections. Use the tab key or set a new tab on the ruler (Select Tab... from the Format menu; a tab on your ruler is represented by a triangle icon). The tab character is the dark arrowhead that points to the right. To see it, go to Preferences under the Edit menu and select Show Invisibles. (See Figure 5.) With tabs in your document, the printed result is smoother and more legible.

Text that floats
A little-used feature of ClarisWorks is the independent text frame. This text frame can have its own margins, style, and even its own columns. You use an independent text frame for creating reversed text (white text on a black background), for example To create a new independent text frame in a Word Processing document:

1. Hold down the Option key as you draw a text frame.
2. Enter your text in the text frame.

The text in the text frame in completely independent of the text in the main Word processing document of which it is part. You can still spell check and apply styles, but to select and edit the text in the independent text frame, you need to click in that frame.

Database

Easy Database Graphing
When you have database information that calls for a graph. Try this:
1. Do a find for the records you wish to see graphed.
2. Choose List View from the Layout menu (ClarisWorks 4.0 owners: Choose Show Multiple from the Layout menu).
3. Choose Select All from the Edit menu.
4. Then choose Copy from the Edit menu.
5. Choose New from the File menu and select spreadsheet.
6. Choose Paste from the Edit menu.

Then with little or no manipulation you can create a graph as you would with any other spreadsheet.

Drawing

Perfectly Spaced Drawings
Many times in Draw mode you may need to duplicate a single object repeatedly. And you would like to have them equidistant. By duplicating the first object, repositioning the duplicate, then choosing Duplicate from the Edit menu once again, all consecutive duplicates will be uniformly spaced just like the first one.

Placing Objects Precisely
When working in the Draw environment, you may find that the objects you have drawn 'snap' to only certain areas on the document. You can never get them exactly where you want them. To get around this, go to the Options menu and choose Turn Autogrid Off. Now you should be able to accurately place objects anywhere on the document. For small movements or 'nudging' an object, use the arrow keys on your keyboard to move the object. This will move the selected object one pixel at a time. Be sure to use your Alignment tools in the Draw environment (select Align Objects... from the Arrange menu; see Figure 6) to align objects you have selected.

Corrupted File Warning with ClarisWorks 3.x under Windows 95

How to work around the error message "This is not a ClarisWorks file or it has been corrupted".

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
When running ClarisWorks for Windows 3.x under Windows 95, double clicking on a ClarisWorks document in either the WINDOWS EXPLORER or MY COMPUTER produces an error message as follows:

"THIS IS NOT A CLARISWORKS FILE OR IT HAS BEEN CORRUPTED"

followed by:

"FILE NOT FOUND"

This only seems to be a problem when double-clicking on a ClarisWorks document that resides in a folder whose name has a space in it. For example:

"My ClarisWorks Documents" would produce the error mentioned above
"My_ClarisWorks_Documents" would work fine
"Clworks" would also be fine

Opening this file via the OPEN dialog box from within ClarisWorks 3.x also seems to work fine, regardless of whether or not the folder that the document is residing in has a space in its name. It only seems to affect opening documents by double-clicking outside of ClarisWorks.

NOTE: This has been tested with version 3.0v1 and 3.0v2.

"Not Enough Disk Space..." When Installing ClarisWorks 3.x Under Windows 95

How to get around this error if you are experiencing it.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
When installing or reinstalling ClarisWorks under Windows 95, you may receive the following error:

"NOT ENOUGH DISK SPACE TO INSTALL TEMPORARY FILES"

The problem in this instance is that the environment variable that specifies the Temporary directory (TEMP directory) is invalid. Make sure that the SET TEMP= statement in the AUTOEXEC.BAT file references a valid directory on your hard drive.

To edit / check your AUTOEXEC.BAT under Windows 95, follow these steps.

1. From the START menu choose RUN
2. On the command line, type in SYSEDIT and click on OK
3. In the SYSTEM CONFIGURATION EDITOR, choose AUTOEXEC.BAT from the WINDOW menu
4. Either edit your existing statement or type "SET TEMP=C:\\WINDOWS" on a new line

NOTE: "SET TEMP=C:\\WINDOWS" is only used as an example. Any valid directory can be specified as the Temporary directory.

5. Choose SAVE from the FILE menu
6. Click on the CLOSE button (the button with the X in it) to close the EDITOR window

Once the changes have been made to the AUTOEXEC.BAT file, your system will need to be restarted for the changes to take effect. Save any work in progress and restart your system.

ClarisWorks: "CALL TO UNDEFINED DYNALINK" Error

Some .DLL incompatibilities will cause this error in other applications after installing ClarisWorks.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If, after installing ClarisWorks 3.x for Windows, you attempt to launch either Microsoft Word or Microsoft Excel (or other Microsoft Office applications) and you see the following error message:

APPLICATION ERROR
"CALL TO UNDEFINED DYNALINK"

then follow these steps:

1.Uninstall / reinstall ClarisWorks for Windows
2. Delete the following files from your \\WINDOWS\\SYSTEM directory

OLE2CONV.DLL
OLE2DISP.DLL
OLE2NLS.DLL
COMPOBJ.DLL
STORAGE.DLL

3. Reinstall any / all of your Microsoft Office package.

Explanation: This is caused from an incompatibility with certain Dynamic Link Library (.DLL) files that are installed during the installation of Win32s and those used by Microsoft Office products.

The .DLL files have to be deleted (or renamed) because the Office install program will not overwrite the files with the correct versions if it detects a copy of the file being on your system already. Deleting (or renaming) the files ensure that the proper versions of the files will get copied over.

This error occurs anytime an application tries to make a call to a .DLL file that is older than the .DLL that it needs. It is a generic error message that means the application tried to register a .DLL file that either does not exist or is incorrect.

This error does not occur with all version of Microsoft Office or Office products (Word, Excel, etc.)

For additional information and support, please contact Microsoft Technical Support at (206) 454-2030.

Changing Line Thickness in Filled Tabs In ClarisWorks

Step by step instructions for changing the the line weight of filled tabs

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
It may not be something you would normally want to do, but yes, it is possible to change the line thickness of filled tabs in ClarisWorks 2.x/3.0/4.0, although the procedure changes slightly with ClarisWorks 4.0

Changing the line weight of filled tabs in ClarisWorks 2.x/3.0:

1. Add the Thicker Line tool and the Thinner Line tool to your Shortcut Palette. The Thicker Line tool is a thin line with a red arrow pointing towards a thicker line; the Thinner Line is its opposite.

2. Use a standard (non-filled) tab, and tab as desired.

3. Bring up the Tool Bar. Select the Line Tool, and draw a line equal to the length of the desired Filled Tab. Use the Thinner or Thicker line tool as desired. The Thinner Line tool will allow you to create a line even thinner than Hairline, although this will not be apparent on screen unless you increase magnification.

4. Once the line is the desired thickness, copy it. Select the tabbed space and replace it with the copied line. The line will be pasted in as an in line graphic. Select the arrow cursor and trim or lengthen the line as appropriate.

5. With the line selected, go to the Style menu and select Subscript. This will drop the line slightly below the line of text. Go to the Size menu and select a smaller font size for this selected line. Trial and error will find the correct match. (Example: for 8 point text, select a 4 point size for the line).

Changing the line weight of filled tabs in ClarisWorks 4.x:

1. Create a Fill Tab as you normally would [Format:Tab].

2. To create a thicker line, follow the procedures described above.

3. To create a thinner line, select the Filled Tab, then select Inferior from the Style menu. The resulting Filled Tab may actually be thinner than it appears on screen, so view at a greater magnification to reveal its actual size.

Duplicate Layout Does Not Work in The Spanish Release of ClarisWorks 3.0Ev1

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In ClarisWorks 3.0Ev1 (Spanish Version) the option for Duplicate Layout does not work. To reproduce this problem do the following:

* Create a new Database document
* Select from the menu Aspecto (Layout), Nueva presentaci-n...(New Layout...)
* Click on Duplicar (Duplicate) This option will not accept a selection.

This particular issue with ClarisWorks 3.0E has been fixed in 4.0E.

Getting Garbled Text In ClarisWorks When Opening A Document

Translators don't automatically always choose the correct file type when settings are set to All Available files.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If you try to open up a file that was not created in ClarisWorks. The file is translated by the translators and converted into ClarisWorks but the result may be garbled.

The problem is that ClarisWorks may not recognize the proper file type when the settings are left on All Available files. This may be due to the file coming from a PC. Selecting a Document Type and the desired translator from the File Type should correct the problem.

Introduction

To create documents that can be viewed by a World Wide Web (WWW) browser, you use the Hypertext Markup Language (HTML). HTML consists of a set of tags (formatting codes) added to text. For example, if the text 'Local News' is formatted as an 18 point header, the text looks like this: <H2>Local News</H2> when translated to HTML. Text can also be tagged to create a hypertext links to other documents. You can use ClarisWorks to open, edit, and create HTML documents without having to be familiar with HTML tags.

This document describes how to:
* open (import) HTML documents so you can read and edit them as word processing documents
* create word processing documents and save (export) them in the HTML format

As you get started, please keep the following points in mind:
* You should be familiar with the concepts and techniques for working with ClarisWorks word processing documents, stylesheets, and shortcut buttons. For more information on these topics, see the documentation that came with ClarisWorks.
* Each WWW browser interprets HTML tags in slightly different ways. For example, some browsers may display a header in color in an elegant typeface, while a text-only browser may display the same header in capital letters in the same size and font as the rest of the document. The ClarisWorks HTML translator uses the default display styles for Mosaic, a browser created by the National Center for Supercomputing Applications (NCSA). For more information on NCSA Mosaic, visit the WWW site at:
http://www.ncsa.uiuc.edu/SDG/Software/Mosaic

* The translator file is called 'WWW [HTML]' and is installed, along with other translators, in the Claris Translators folder in the Claris folder (inside the System Folder). You don't use the HTML translator file directly. Instead, you use the ClarisWorks save and open commands to direct the file through the translator.

Note: Updates to this document are available on ClarisWeb at: http://www.claris.com/pubs/clarisworks/html-primer.html

Creating HTML documents

This section describes how to create new HTML documents. For information on entering and formatting text in HTML documents, see the section 'Formatting and editing HTML documents.'

Using stationery to create HTML documents

The easiest way to create HTML documents is to start with the ClarisWorks HTML stationery, a template included with ClarisWorks 4.0. The stationery is a blank preformatted word processing document that you can reuse.

To open the stationery document:
1. Launch ClarisWorks by double-clicking the ClarisWorks icon.

2. Choose New from the File menu.

3. In the New Document dialog box, select Use Assistant or Stationery.
4. Choose Internet from the pop-up menu, select WWW [HTML] Document, and then click OK.
You see the blank, untitled stationery in its own window. The original document remains unchanged, ready for you to use again. The stationery includes a set of HTML styles in the stylesheet palette and three shortcut buttons, 'Make Hypertext Link,' 'Unordered List Item,' and 'Horizontal Rule.'
5. To open the stylesheet palette, choose Show Styles from the View menu.
The styles include headers of various sizes as well as styles for normal, literal, and preformatted text.
6. To display the shortcuts palette, choose Shortcuts and then Show Shortcuts from the File menu.
For specific information about using the shortcut buttons to create HTML documents, see the sections 'Hypertext links,' 'Lists,' and 'Horizontal rules.'
Note: To make the buttons appear in the shortcuts palette for any ClarisWorks word processing document or text frame (not just in a stationery document):

1. Launch ClarisWorks and open the HTML stationery by following Steps 1–4, above.
2. Choose Shortcuts and then Edit Macros from the File menu.
3. Select Make Hypertext Link from the Macro pop-up menu and then deselect
Document Specific. Do the same for Unordered List Item and Horizontal Rule.
4. Click Done.
The HTML stationery shortcuts now appear in the shortcuts palette for any word processing document.

Creating HTML documents without using stationery
If you prefer, you can create an HTML document in a regular word processing document instead of the HTML stationery.

To open a word processing document:
1. Launch ClarisWorks by double-clicking the ClarisWorks icon.
2. Choose New from the File menu.
3. In the New Document dialog box, select Word Processing and then click OK.
Using the ClarisWorks HTML stylesheet or HTML shortcut buttons is optional. If you want to use the ClarisWorks HTML stylesheet, go on to the next step. If you want to use the HTML shortcut buttons, follow the steps in the Note in the previous section 'Using stationery to create HTML documents.'

4. To import the HTML stylesheet into your blank document, choose Show Styles from the View menu.
5. In the File menu on the stylesheet palette, choose Import Styles.
6. Navigate to the ClarisWorks Styles folder in the ClarisWorks 4.0 Folder, select HTML Styles, and then click Open.
7. In the Select Styles to Import dialog box, click Check All and then click OK.

Saving documents as HTML files
To save (export) a document as an HTML file:
1. Choose Save As from the File menu.
2. In the Save As pop-up menu, select WWW [HTML].
3. Navigate to the folder in which you want to save the file, type a file name, and click Save.

To help you keep track of the file format of your documents, you can add extensions to the filenames, such as myfile.html for an HTML file, or myfile.cw for a ClarisWorks file. For best results with HTML files, don't use spaces in the filenames. Either remove spaces or replace them with underscores or hyphens.
Important: Be sure to keep copies of your documents in their original formats, especially HTML documents that you import. The translator does not provide a complete set of HTML tags and may replace some of the original tags.

Opening HTML files
To open (import) existing HTML files:
1. Launch ClarisWorks by double-clicking the ClarisWorks icon.
2. Choose Open from the File menu and then navigate to the HTML file you want to open.
3. In the Document Type pop-up menu, select Word Processing. In the File Type pop-up menu, select WWW [HTML]. (If you'd like see what the HTML codes in your text look like, select All Available or Text in the File Type pop-up menu.)
4. Select the name of the file you want to open, and click Open.
The HTML document opens. You see it as it might look when viewed by an HTML browser. If you want to use the optional ClarisWorks HTML stationery features, continue to the next step.
5. Import the HTML stylesheet into your document by following Steps 4–7 in the section 'Creating HTML documents without using stationery.'
Note: Imported text is styled as 'Body+' in the stylesheet. However, the translator tags the text correctly when you export it, even when styled as 'Body+,' and you can use the stylesheet to style any new text that you type.

6. Set up your document with the HTML shortcut buttons by following the steps in the Note in the section 'Using stationery to create HTML documents.'

Formatting and editing HTML documents
This section describes how to use ClarisWorks text and paragraph attributes to format or edit documents that can be translated to HTML format.

Getting started
You start with a ClarisWorks word processing document. To create an HTML document, follow the directions in the section 'Creating HTML documents.' To open (import) an HTML file that you want to edit, follow the directions in the section 'Opening HTML files.'

It's easier to apply the various text styles if you can see the carriage returns and spaces in your document. To show these characters-called invisibles or formatting characters-type
Command-; (semicolon). To hide the formatting characters, type Command-; again. (The Command key is the cloverleaf key on the bottom row of the keyboard.)

If you're using the ClarisWorks stationery, or if you've set up a word processing document so you can use the HTML stationery features, show the stylesheet (choose Show Styles from the View menu) and the shortcuts (choose Shortcuts and then Show Shortcuts from the File menu).

Important: Apply only those ClarisWorks styles that start with 'HTML' (for example, HTML Normal Text). With few exceptions, (noted in the applicable sections) the HTML translator and browsers don't recognize any other ClarisWorks styles.

Paragraphs
Type your text and end the line or paragraph by pressing Return (or place the insertion point in the text, choose Paragraph from the Format menu, and then type 1 in the space after box). The default paragraph style for the stationery is HTML Normal Text. The translator tags text styled as HTML Normal Text as a paragraph. Most browsers separate paragraphs by adding white space after the paragraph.
Note: The translator interprets soft returns (Shift-Return) as spaces.

If you don't want extra white space after a block of text, place the insertion point in the text, choose Paragraph from the Format menu, and then type 0 in the space after box. The translator will tag the carriage return as a break. Browsers don't usually add white space after a break.

Tabs
Tabs are usually translated into white space, except when the tabs appear in lists or preformatted text (see the sections "Lists" and "Preformatted text").

Character formatting
To make characters bold, italic, or underline, select the text and choose Bold, Italic, or Underline from the Style menu at the top of the screen. If you choose any other item from the Style menu (for example, Shadow or Inferior), the translator interprets it as plain text.
Note: The translator interprets most bold text as a header. Headers appear on a separate line when viewed from a browser. If you don't want the translator to interpret bold text as a header, make the font size of bold text 11, 12, or 13 points.

Headers
Use headers to structure and organize the HTML document, just as you use headers to structure and organize any text document. To create a header, type the text, select it, and then choose a header styleÑsuch as HTML Header (9 pt.)Ñfrom the stylesheet (or choose Bold from the Style menu and any size except 11, 12, or 13 points from the Size menu). When the translator interprets text styled as a header, it adds white space above and below the text.

Unsupported characters
The translator ignores or interprets as spaces characters such as soft returns (Shift-Return), page numbers, page breaks, and date characters inserted by using the Insert Date command.

Hypertext links
A hypertext link is a string of clickable text (called an anchor). When you click on the link in a browser, you 'jump' to another document.

To make a hypertext link:
1. Select the text that you want to be seen as the link anchor.
2. Click the Make Hypertext Link shortcut button (or style the text so it looks different from the surrounding text and then insert a footnote by choosing Insert Footnote from the Format menu).
Make hypertext link shortcut button
Clicking the button changes the selected text to blue underline and inserts a footnote mark. You see footnote text instructing you to fill in the Uniform Resource Locator (URL) of the document you are linking to.
Note: If you insert a footnote but don't change the anchorÕs appearance (for example, to blue underline), the translator uses the text preceding the footnote (up to 255 characters) as the link anchor. Note also that HTML doesn't support footnotes, so you can't use footnotes except to create hypertext links.

3. Replace the footnote text *INSERT URL HERE* with the URL of the destination document.
URLs represent file locations on the World Wide Web. A URL has the general form

scheme: //host.domain [:port] /path /filename

For more information on HTML and URLs, visit the WWW site at http://www.ncsa.uiuc.edu/demoweb/html-primer.html.

Lists
Use lists to group related items. List items always start with a tab (or a .5 inch indentation). You can show the relative importance of each item in a list by using multiple tabs (or multiple .5 inch indentations) to indent itemsÑas you would in an outline. Items in ordered lists are numbered and items in unordered lists are set off with a bullet. You can include both ordered items and unordered items in the same list.

To create a list:
1. Press Tab to indent the line one or more times (or choose Paragraph and type a multiple of .5 inches in the Left Indent box).
Each tab character, regardless of tab size (or each .5 indentation, as typed in the Left Indent box), adds an additional level of indention.

2. Type the character that defines the type of list item (ordered or unordered).
To create this type of list item - Do this
Ordered (numbered) - Type a number followed immediately by a period, right parenthesis, or a hyphenÑfor example, 1., 1), or 1-. Browsers vary in how they format the numbers on ordered list items.
Unordered (bulleted) - Insert a bullet by clicking the Unordered List Item shortcut button (or type the bullet by pressing Option-8). Most browsers display a bullet at the beginning of each item in an unordered list.
Unordered list item shortcut button
3. Type the text for the item. The text can extend to more than one line.
4. Repeat Steps 1&#65533;?3 for each item in the list.
5. End the list by doing one of the following:
* Start the next line of text at one less tab than the last item of the list.
* Press Return to insert a blank line after the last list item, and begin the next text segment with a non-list character (that is, no bullets or numbers).
Important: Don't use styles from the stylesheet (such as Bullet or Diamond) to create lists in your HTML documentÑthe HTML translator and browsers don't recognize ClarisWorks styles as list types.

Example 1 Each additional list level is called an embedded list.

1. The '1.' is the beginning of the initial list.
2. This is the second item of the initial list.
1. Here we are at two list levels, thus we begin a new list.
2. This is the second item of the embedded list.
3. Here we end the embedded list, and continue the initial list.

The embedded list could have been a bulleted list. The type of list (ordered or unordered) is determined by the first list item in that list level.

Example 2 This ordered (numbered) list contains an unordered (bulleted) list:

1) The '1)' is the beginning of the initial ordered list.
2) Second item of the initial list
* First item of the unordered embedded list.
* Second item of the unordered embedded list.
3) Third item of the initial list.

Example 3 This list shows that the first character of a new list determines if the list is ordered or unordered. When viewed by a browser, the list in this example is ordered exactly the same as the list in Example 2.

1- The '1-' is the beginning of the initial ordered list..
* Second item of initial list (the bullet will appear as Ò2.Ó in the HTML document)
* First item of the unordered, embedded list.
2- Second item of the embedded list. The number Ò2-Ó will be a bullet.
3- Third item of the initial list.

Pictures
You can include pictures (images) in your HTML document. The translator supports anchored pictures, but not floating ones. To make sure your pictures are anchored, select the picture and choose Cut from the Edit menu. Then click in the text where you want the picture to go and choose Paste from the Edit menu. Correctly anchored pictures have one handle when you select them. (Floating pictures have four handles when selected.)

The translator automatically saves the pictures as individual files and creates tags in the HTML file that refer to the picture files. The references are to the same relative directory as the HTML file, so if you move the HTML document to another location, you must also move the picture files.

The pictures are saved as PICTs, but to be able to view the pictures in the document on a WWW browser, you must convert them to Graphic Interchange Format (GIF). The translator adds the .gif extension to the picture filenames in the HTML source file, but you still must to convert the file from PICT to GIF format. When you've finished, check to be sure that the filename for each picture has the Ò.gifÓ extension in lower case. Note:Shareware conversion applications such as GifConverter and GraphicConverter are widely available from on-line services and popular Macintosh FTP archives on the Internet.

Horizontal rules
Horizontal rules are useful for separating sections of text. To insert a horizontal rule, click in the text and then click the Horizontal Rule shortcut button (or press Return, type a series of underscore characters, and then press Return again).
Horizontal rule shortcut button.
You see a series of underscores at the insertion point in the document.

Preformatted text
If you want a section of text to look exactly as you type it, select the text and then click

HTML Preformatted Text in the stylesheet palette in the HTML stationery (or choose Monaco from the Font menu). Preformatted text appears in both your document and the browser in a monospaced font:

```
            This is an example of what
        preformatted     text     looks          like.
```

Although tabs are supported in preformatted text, you should use spaces instead of tabs, because tab sizes can vary in different browsers.

Literal text
There are many features in HTML that the translator doesn't support. If you want to add advanced or unsupported HTML commands to your document, select the text and then click HTML Literal Text in the stylesheet palette in the HTML stationery (or choose Text Color from the Style menu and select a shade of red).

Technical details
This section describes some of the details of the HTML tags used by the translator.

Character formatting HTML has two kinds of text styles, logical and physical. Logical styles are interpreted differently by different browsers. For example, the logical style (that is, ÒemphasisÓ) may be represented as red single underline by one browser and italics by another. Other examples of logical text styles are and <cite>. Physical styles, such as italic, underline, and 11, 12, or 13 point bold, are represented as typed. When you format text as italic, underline, or 11, 12, or 13 point bold, the ClarisWorks HTML translator tags these physical character styles with logical character styles, like this:

These types of characters	Are assigned this HTML tag
Italics	<cite>
Underline	
Bold (11, 12, or 13 point only)	

Note: If bold text is any size except 11, 12, or 13 points, the translator tags it as a header. See 'Headers,' below.

International characters The translator supports most of the ISO Latin 1 character set standard on both export and import.

Special characters Some characters (< > & ; and /) are used in HTML tags. If you type the characters <, >, &, ; or /, the translator interprets them as typed. If you want the characters to be interpreted as part of HTML tags, style the tags as literal text. See the section 'Literal text.'

Paragraphs and carriage returns The translator tags as a paragraph (<P>) any text followed by a hard return (created by pressing the Return key). The translator tags as a break (<BR>) any text block followed by a hard return that is formatted by placing the insertion point in the text, choosing Paragraph from the Format menu and then setting Space After to 0 (zero).

Headers A header is a logical style. The size depends on the type of header. Browsers usually insert white space above and below the header and display headers as bold.

If a text is bold, the translator checks the font size and then tags the bold text according to these rules:

If the bold text is this size	The translator tags the text as
Greater than or equal to 20 points	<H1>
Greater than or equal to 18 points and less than 20 points	<H2>
Greater than or equal to 14 points and less than 18 points	<H3>

Greater than 10 points and less than 14 points	
Greater than 9 points and less than or equal to 10 points	<H5>
Less than or equal to 9 points	<H6>

Lists For each list level, the translator inserts the tag <OL> for an ordered list and <UL> for an unordered list. For each list item, the translator inserts a list-item tag (<LI>).

Horizontal rules If underscores begin and end with a hard Return, the translator inserts the <HR> (horizontal rule) tag in the HTML document.

About this HTML translator
The HTML translator included with ClarisWorks 4.0 represents the joint efforts of Claris and a dedicated team at the Highly Interactive Computing Project (Department of Electrical Engineering and Computer Science) at the University of Michigan in Ann Arbor.

Claris would like to express its thanks to the Highly Interactive Computing Project, including:

Brian Sullivan
Ryan Day
Sean DeMonner
Jeff Spitulnik
Amanda Pryor
Edward Andrews
Craig Braman
Elliot Soloway

Claris also extends its thanks Dr. Barbara Kurshan of Educorp Consultants.

ClarisImpact: Placing SYLK or DIF data in Tables, Timelines and Data Charts

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The following is from the ClarisImpact 1.0v4 Important Information file:

When placing SYLK or DIF files in Tables, Timelines, and Data Charts, make certain that you select the SYLK or DIF translators in the Place dialog's "Show:" pop up menu. If the SYLK or DIF files menu item is not selected, the file may be imported as text.

Date Fields: Calculating The Difference Between Dates, Finding Future Dates

A quick lesson on using date fields in a calculation

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
FileMaker Pro stores dates internally as number of days since January 1, 0001. ClarisWorks stores them as the number of days since January 1, 1904. For example, the screen may show January 1, 1996, but internally ClarisWorks stores 33603. For the same date, FileMaker Pro stores 728659.

If you have two date fields, and you wish to find the number of days between them, you simply subtract the earlier date from the later date.

In ClarisWorks: DaysDifferent (Calculation, Number result) ='Date2'-'Date1'
In FileMaker Pro: DaysDifferent (Calculation, Number result) = Date2 - Date1

If Date2 was January 1, 1996, and Date1 was January 1, 1995, the formula would return 365.

To find a date in the future, you simply add the number of days in the future to the existing date.

In ClarisWorks: DaysFuture (Calculation, Date result) = 'StartDate'+'SevenDayTrial'
In FileMaker Pro: DaysFuture (Calculation, Date result) = StartDate + SevenDayTrial

If StartDate was January 1, 1996, the result of this calculation would be January 8, 1996.

NOTES:
Since the slash (/) ?? a mathematical symbol ?? is used to separate the day, month and year in a date, you cannot use that format in a calculation formula. 1/1/1996 in a date field is a date, but in a calculation it means 1 divided by 1 divided by 1996. Which results in .000501002004008016.

To type a date in a formula, you must use either reference date field or use the Date function. For example, January 1, 1996 would be Date(1,1,1996) in FileMaker Pro and Date(1996,1,1) in ClarisWorks.

Be careful to use the full year in a calculation. If you type 1/1/96 into a date field, it would return January 1, 1996. If you type Date(1,1,96) into a calculation in FileMaker Pro, it would return January 1, 96. The year 96. Not 1996. A thousand years earlier!

ClarisImpact 2.0 Help Incorrectly References Microsoft Word 6.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The online Help for ClarisImpact 2.0 implies that ClarisImpact can import and export Microsoft Word 6.0 format. Unfortunately, this is incorrect. ClarisImpact is able to read and save as Microsoft Word 4.0-5.0 format, but not 6.0.

Specifically, the online help topic 'Importing, placing and exporting files' includes a table that lists Translators and has checkmarks by 'Import' and 'Export'. It indicates that ClarisImpact supports Microsoft Word 6.0 in both categories.

Claris has not announced any plans of including a Microsoft Word 6.0 XTND translator and apologizes for any inconvenience caused by this error in the online help.

ClarisImpact owners who do extensive work requiring file transfers of Microsoft Word 6.0 may wish to contact DataViz, manufacturers of MacLinkPlus, a file transfer utility for the Macintosh. MacLinkPlus includes dozens of XTND translators that work with ClarisWorks, MacWrite II, and other Claris products that support the Claris XTND technology. DataViz also makes translators for use on the Windows platform.

[DataViz Inc, 55 Corporate Drive, Trumbull, CT 06611; (800) 733-0030; Fax: (203) 268-4345.]

LapLink III: Macintosh IIfx Compatibility CDEV Available

LapLink III for the Macintosh does not work on the Macintosh IIfx. On launch, it crashes with an ID = 1.

This article has been archived and is no longer updated by Apple.
Traveling Software has heard reports of this problem. They are currently trying to locate the cause. If they find a fix for this situation, we will post the information.

Apple provides a CDEV that turns off the IOP of the Macintosh IIfx. This CDEV is available for licensing from the Software Licensing group. Traveling Software has obtained the license for this CDEV and will be providing it to registered users of LapLink III for the Macintosh. Contact Traveling Software for this CDEV. For more details, search the Technical Info library under "Traveling Software."

How to Reassociate a Data File / Document File in Windows 95

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When using Windows 95, if double clicking on a data file / document file in either MY COMPUTER or WINDOWS EXPLORER opens up the document in the wrong or an undesired application, it is likely that the association is incorrect.

To reassociate a data file / document file to another application, follow these steps.

1. Double click on MY COMPUTER
2. Select OPTIONS from the VIEW menu.
3. Click on the FILE TYPES tab.
4. Choose the document type that you wish to reassociate from the REGISTERED FILE TYPES list.
5. Click on the EDIT button
6. In the ACTIONS list, click on the OPEN option
7. Click on the EDIT button
8. In the APPLICATION USED TO PERFORM ACTION field, type in the modified path to the application you wish to use.

NOTE: The BROWSE button can be used navigate through your folder / directory structure to find the desired application.

9. Click the OK button
10. Click CLOSE to close the EDIT FILE TYPE window.
11. Click CLOSE to close the OPTIONS window

Double clicking on the file in either MY COMPUTER or WINDOWS EXPLORER will now open it up in the newly associated application.

This might be helpful for people who have several versions of an application installed on their machine but want certain file types to be opened up with certain versions or want to redirect certain files (i.e. text files) from their default association to another application.

Consult Mircosoft Technical Support for additional Technical Support and information at (206) 454-2030.

Two New Text Styles: Uppercase and Lowercase In ClarisWorks 4.0

How to add these two buttons to your shortcuts palette, and some of the limitations of these shortcuts

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
ClarisWorks 4.0 features two new text styles: Uppercase and Lowercase. These styles are only available as buttons in the Shortcut palette. To add them to your shortcuts, choose Edit Shortcuts from the File menu, and Add the two buttons to your palette.

Some limitations:

*The uppercase and lowercase buttons are only available in word processing documents.

*The uppercase and lowercase buttons require System 7.1 or higher. If you highlight some text when in system 7.0.1, you may click the uppercase and lowercase buttons, but they will not function.

Global Village Modems, Tools, and Basic Initialization Strings

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Most Global Village modems do not need a specific tool other than the Apple Modem Tool. That includes the 1XX series of the PowerPort modem. The Duo and 500 series will normally use a 500/Duo tool, which is installed when GlobalFax 2.5 is first installed.

Global Village's modems generally require the same basic initialization string, (AT&F1). Here is a list of most of the current and discontinued Global Village modems and their exceptions:

Externals:
Teleport Bronze for Performa - AT&F
Teleport Bronze II - AT&F
Teleport Silver, Gold, Mercury, & Platinum - AT&F1 (Hardware Handshake = CTS only)
Teleport Gold II (includes Performa) - AT&F1

Internals:
Powerport Bronze - AT&F
Powerport Gold (ATI1 checksum 246) - AT&F1 (Hardware Handshake = CTS only)
Powerport Mercury 1XX Series - AT&F1 (Hardware Handshake =CTS only)
Powerport Mercury 2XX (Duo) Series - AT&F (Handshake =*None)
Powerport Mercury 5XX Series - AT&F (handshake = *None)
Powerport Platinum 1XX Series - AT&F1 (Hardware Handshake =CTS only)

*built-in flow control

Supra 288, Latest ROM (version 1.3.07) Not Connecting to AOL

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Apparently the problem is that certain AOLNet nodes are incompatible with the Rockwell chip set that Supra uses in their 28.8 modems. Supra Corporation is investigating the problem. In the meantime, you can add a \\N5 to your modem setup string for the Supra and it will reportedly take care of the problem.

Adding or modifying a modem configuration in the Modem pop-up menu

You can add new entries to the Modem pop-up menu or modify existing entries. This allows you to create a set up for your modem that meets your specific needs.

1. In Claris Emailer, select a service that uses the Apple Comm Toolbox: either America Online or CompuServe.

2. Click the Edit button to open the Service entry.

3. Click the Configure button to display the Apple Modem Tool configuration dialog.

4. Choose ÒModify This MenuÓ from the Modem pop-up menu in the Modem Options area of the dialog box for the Apple Modem Tool.

5. If modifying an existing entry, click on the modem that you would like to modify.

If you are creating a new modem entry, click on the modem that is most similar to the modem that you would like to add. Selecting the modem first creates a duplicate of that modem configuration.

6. Click the Add button to add a new configuration or click the Modify button to modify an existing entry.

7. Make the changes to the setup.

8. Click Done to save your changes and return to the Connection Settings dialog box.

9. Choose the modem definition that matches your modem from the Modem pop-up menu.

10. Click OK to save this configuration.

If your modem is not listed in the Modem pop-up menu, consider contacting the modem manufacturer to see if they have a setup file for the Apple Modem Tool.

TA43416_Prototyper_Using_With_LightSpeed_Pascal__(TIL05666).pdf

Prototyper 2.1: Using With LightSpeed Pascal 3.0

In a development environment, will "Prototyper" take advantage of the object-oriented programming capabilities of the latest release of LightSpeed Pascal 3.0?

This article has been archived and is no longer updated by Apple.
The current version of Prototyper, version 2.1, was released before LightSpeed Pascal 3.0. The publishers, Now Software (formerly SmethersBarnes), state that Prototyper 2.1 does not support any of the object-oriented programming features of the LightSpeed Pascal product. However, the code generated by Prototyper can be compiled by LightSpeed Pascal 3.0. For more details, search the Technical Info library under "Now Software."

Scientific Notation Calculation Errors in ClarisWorks for Windows

In the Windows version of ClarisWorks, some formulas within "( )" don't calculate properly in the spreadsheet environment.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
In the Windows version of ClarisWorks, some formulas within "( )" don't calculate properly in the spreadsheet environment. For example: The formula =(-1)^3 should return the value -1, but returns 1 (positive one) instead.

If the ( ) are removed from the formula, =-1^3 returns the correct -1 (negative one) value.

In another example, if the formula were =(2-3)^3, the answer should be -1, but is still 1 (positive one).

The ( ) cannot be removed in this instance to product the correct answer .

This only exists with ClarisWorks for Windows.

Options File Not Recognized by WP Shortcut Button in ClarisWorks 4.0 Macintosh

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When a Stationary Document is saved as "ClarisWorks WP Options" it is not utilized by the "New Document" Shortcut button automatically. It will default instead to a generic or default new document. A workaround is to copy the Stationary file from the ClarisWorks Stationary file and place it into the top level of the Claris Folder in the System Folder.

How to Wrap Text Inside or Fill a Shape with Text

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Although this technique is suitable for ClarisImpact, it can also be applied to a drawing object in ClarisWorks and ClarisDraw. The trick is to create objects that surround your shape. These objects will keep your text between their boundaries, and it will only appear that your original object is the boundary.

Here are the steps to accomplish this:

1. Draw a circle with a 3 ?inch diameter. This will be the object you wish to fill.
2. Using the polygon tool, click first near the top of the circle, then click several points along the left side of the circle until you reach the bottom. Then click to the left of the circle, once at the bottom, and once at the top (Figure 1, Step 1).

Note: The more points you use in outlining the circle, the more accuracy you will get.

3. Now select the new object, and duplicate it.
4. Move the duplicate to the right side of the circle.
5. Flip it horizontally.
6. Select each of the bounding objects and set the text wrap to Irregular
(Figure 1, Step 2).
7. With the polygon objects still selected, change the pen weight (line thickness)

to None. The objects will appear to vanish.
8. Turn on Frame Links (linked text) in the Options or Text menu. ('On' will be indicated
by a checkmark next to the option.)
9. With the Text tool, click and drag an outline (frame) surrounding the whole circle.
10. Type within the text frame, and note that the text appears to 'fill' the circle.

Virus Prevention: Install the System from Locked Media (4/94)

This article describes the recommended approach when installing or upgrading software - use locked floppy disks, cartridge drives or CD-ROMs.

This article has been archived and is no longer updated by Apple.

If you install system software or application software from an unlocked floppy disk or unlocked removable cartridge (often called a Syquest cartridge) which uses an Installer application onto a system infected with a virus, that unlocked disk can become infected.

From that point on, every system you use that Installer disk on becomes infected.

To prevent any viruses from spreading, you must know your master disks are clean, and you must use them only in a locked state. You can also use CD-ROMs, such as Apple's InstallMeFirst CD which are read-only disks and have been checked for viruses before production.

Article Change History:
1 April 1994 - Added information on other locked media, as well as CD-ROM's
25 August 1993 - Removed references to specific viruses and virus
software that was outdated information.

GrayShare Update 1.0 Read Me

PRINTER SOFTWARE

This folder contains the latest changes to your printer's software. Follow these instructions to install your new printer software. After the installation instructions are some helpful printing tips.

Getting Ready to Install

Before you install your new printer software, you must make sure Printer Sharing is turned off in the Chooser. To turn off Printer Sharing:

1. Choose the Chooser from the Apple menu.
2. Select the icon of your printer. Depending on the printer you have, a Setup button may appear on the lower right side of the Chooser window. If no Setup button appears, close the Chooser and skip ahead to the next section, "Removing Your Old Software."
3. If a Setup button does appear, click it.
4. In the dialog box that appears, make sure the Share This Printer box does not have an X inside. If you do see an X in the box, click on the X to remove it.
5. Close the Chooser.

Removing Your Old Software

It's a good idea to remove your old software before installing your new software. To remove your old software, follow these steps:

Step 1
Drag the Printing Prefs folder to the Trash.
--If you have System 7, the Printing Prefs folder is inside the Preferences folder in your System Folder.
--If you have System 6.0.7, the Printing Prefs folder is in your System Folder.

Step 2
If you have Personal LW LS, LaserWriter Select 300, LaserWriter 300, StyleWriter, or StyleWriter II software on your system, then drag the software icons to the Trash.
--If you have System 7, the software is inside the Extensions folder in your System Folder.
--If you have System 6.0.7, the software is in your System Folder.

Step 3
Drag Printer Share extension to the Trash.
--If you have System 7, the Printer Share software is in the Extensions folder in your System Folder.
--If you have System 6.0.7, the Printer Share software is in your System Folder.

Step 4
Remove Chooser
--If you have System 7, drag Chooser from the Apple Menu Items folder in your System Folder to the Trash.
--If you have System 6.0.7, use Font DA Mover to remove Chooser from your System.

Installing Your New Software

To install your new printer software, follow these steps:

Step 1
Drag the PrinterShare icon from the Driver Update Disk to the icon of your System Folder. If you see a message asking if you want to replace your existing file with a newer one, click OK.

Step 2
Drag the icon of your printer (either the StyleWriter II or LaserWriter 300) from the Driver Update Disk to the icon of your System Folder. If you see any messages on your screen, click OK.

Step 3
Update the Chooser

--If you are using System 7, drag the Chooser to the icon of your System Folder.
--If you are using System 6.0.7, use Font DA Mover to install the new Chooser.

Step 4
Choose Restart from the Special menu. Your Macintosh will take a few moments to start up again.

Step 5
Choose the Chooser from the Apple menu.

Step 6
Select your printer in the Chooser. You can click Setup to share your printer if you want. For more information about choosing and setting up your printer, see the documentation that came with your printer.

PRINTER HINTS

This rest of this document includes the latest information about your printer software, as well as hints and tips for printing.

SYSTEM REQUIREMENTS

Your printer works best with Macintosh computers with system software version 7.0 or later installed, and that have hard disk drives with sufficient available space.

You can also use your printer with system software version 6.0.7 or later installed on the hard drive of your Macintosh.

LOW-MEMORY MACINTOSH COMPUTERS

If your Macintosh with System 7 has just 2 Megabytes (MB) of RAM (or 1 MB with System 6), you may occasionally run short of memory. You know you are low on memory when some documents do not print, when a printed document doesn't look correct (for example, if text looks jagged instead of smooth), or when you see "out of memory" messages on your screen. To make more memory available, try these suggestions:

- Open only one application at a time.

- Print color or grayscale images in Black and White mode.

- Make sure the RAM cache is turned off or set as low as possible. (To adjust the RAM cache, use the Memory control panel in System 7, or the Control Panel in System 6.)

- If you're using System 6, make sure MultiFinder is turned off. (To turn MultiFinder off, choose Set Startup from the Special menu. In the dialog box that appears, choose Finder. The next time you start up or restart your Macintosh, MultiFinder will be turned off.)

- If you are using System 7, try printing with background printing turned off. To turn off background printing, open the Chooser, click the icon of your printer (If you are unsure which Chooser printer icon to pick, refer to your printer's user's guide), and click the Off button next to Background Printing.

- INIT files in the System Folder use up some of your Macintosh computer's RAM. Remove these files to free up some memory.

- If you get "not enough memory" errors while printing to a shared printer, turn background printing off.

If you have only 2 MBs of RAM (or 1 MB with System 6), you may want to add more in order to make your Macintosh work more effectively. See the information about service and support that came with your computer to find out who to contact about adding RAM to your Macintosh.

PRINTING TIPS

Follow these suggestions to get the best results with your printer:

- It is recommended that you select Print Quality as Normal and Image as Grayscale in the Print dialog box because it gives you the best results with the fastest printing. (This is the default setting within the Print Dialog box.)

- If you are using System 6 MultiFinder or System 7, it's a good idea to use background printing. This allows you to continue working on your Macintosh while your printer is printing. To turn on background printing, open the Chooser, click the icon of your printer (If you are unsure which Chooser printer icon to pick, refer to the user's guide that came with this software), and click the On button next to Background Printing.

- You can connect your printer to either the modem port or the printer port. (Your printer port may already be used to connect your Macintosh to

an AppleTalk network.)

- If you use your printer with a PowerBook 100, you must connect it to the printer port because the modem port is internal on the PowerBook 100. Be sure to select the printer serial port in the Chooser after you install.

- When sharing your printer, give it a unique name so that other users can tell which shared printers are listed in their Choosers.

- Close the Chooser after making any printer setup changes.

- If you have printer Sharing turned on, and you reinstall your printer software, you must turn Sharing on again.

- If you have problems sharing your printer, reinstall your printer software.

- If you use System 6.0.x and have a LaserWriter driver installed, that LaserWriter driver must be version 7.0 or later to be compatible with the Print Monitor that is used with this printer driver.

- If you get the message "Serial port in use by another application, please quit the application and try again" and there is no other application running, restart your computer before sending another print job.

- For best results, do not attempt to share the printer if you have a large image copied to your Clipboard.

- If you have problems printing from an application program, try giving the application more memory. To give the application more memory, click the application icon to select it. Then choose Get Info from the File menu. In the window that appears, type the new size in the box labeled Current Size (If you have System 7.1, the box is labeled "Preferred Size.")

- If you are having problems printing large, complicated documents in the background, try giving Print Monitor more memory by following the previous item's instructions.

- For best results printing text, and if your applications supports it, turn 'Fractional Width' on before printing.

- To install or remove fonts on System 6, you must use the Font/DA Mover that is on your original printer software disk set.

USING THE PRINTER SOFTWARE WITH APPLICATION PROGRAMS

Some application programs do not yet take advantage of your printer's new features. If you experience problems with your application programs, contact the publishers of the programs. Here are some suggestions for getting the best results from your application programs:

4th Dimension version 2.2.3 (Acius)
Some documents print best at 100% scaling and in portrait (tall) orientation.

Illustrator 3.2 (Adobe)
For best results, use background printing and print at 100% scaling. Adobe Illustrator documents placed into other applications (for example, PageMaker) may print with gray outlines.

Canvas 3.0 (Deneba)
For best results, upgrade to version 3.0.4 or later. If you use Canvas 3.0.4 to create an image that has color patterns, print the image from Canvas rather than from another application.

ClarisWorks 1.0v2 (Claris)
For best results when printing a newly opened document that includes a chart, scroll the window to bring the chart into view before printing.

DeltaGraph Pro 2.0 (DeltaPoint)
Always click the QuickDraw button in the Print dialog box.

Digital Darkroom 2.01 (Aldus)
For best results, use the effects under the Image menu, rather than those under the Gray Maps menu.

Freehand 3.0 (Aldus)
For best results, print at 100% scaling, and turn background printing off.

HyperCard 2.1 (Claris)
Selecting Print Stack, will only allow you to print 16 cards per page. To get around this problem, type in a value larger than 100% in the Scaling field in the Page Setup dialog to get fewer cards per page.

MacDraw Pro 1.5v1 (Claris)

Color patterns printed in grayscale may show moire patterns. To avoid moire patterns, use solid colors instead of color patterns. Solid colors are chosen from the Claris Colors pallet of colors, which is to the left of the pattern pallet.

MacWrite II 1.1v3 (Claris)
The Collate option in the Print dialog box does not work.

Mathematica 2.1 (Wolfram Research, Inc.)
For best results printing color graphics, print using the Bitmap selection and turn background printing on.

Microsoft Excel 4.0
To print using grayscale, set two options in the Print dialog box: choose Grayscale from the Image pop-up menu, and turn on Print Using Color.

Microsoft PowerPoint 2.01f
Handouts and Notes from landscape (wide) documents may not print correctly. For best results, upgrade to PowerPoint 3.0.

Microsoft Works 2.0e
For best results, upgrade to version 3.0 or later. If you use version 2.0e, turn off background printing in the Chooser.

MORE 3.1 (Symantec Corporation)
For best results, print at 100% or less.

Ofoto 1.1 (Light Source, Inc.)
For best results, upgrade to Ofoto 2.0 and create a custom calibration for your printer.

Personal Press 2.0 (Aldus)
For best results, turn background printing on. In some cases you may be able to correct printing problems by giving the application more memory. (Select the application icon, choose Get Info from the File menu, and type the new size in the Current Size field.)

If Personal Press "unexpectedly quits" follow these steps: select another printer driver in the chooser, close the chooser, select Page Setup, save the document, reselect your printer's icon in the chooser, then print. If you are unsure which Chooser printer icon to pick, refer to the user's guide that came with your printer.

PixelPaint 2.1 (SuperMac)
For best results, print at 100% scaling or less.

QuickTime 1.5 (Apple Computer)
For best results, do not enlarge the image beyond the size of the selected page.

Quicken 3.0 (Intuit)
When printing with low memory, you may fail to print. Try the low-memory suggestions listed above.

ReadySetGo 4.5 (Letraset)
For best results, set your monitor to 256 colors or fewer.

ReadySetGo 5.14 (Manhattan Graphics)
Rotated objects may not print correctly.

Symantec GreatWorks 2.0
For best results when printing an envelope in landscape, select Black & White printing.

TeachText (Apple Computer)
If you get a system error 25, try the suggestions in the "Low-Memory Macintosh Computers" section above.

CONTACTING APPLICATION DEVELOPERS

If you are having problems when printing with your applications, you can contact the application developers' technical support lines. Here are some of the telephone numbers:

Acius 408-252-4444
Adobe System, Inc. 408-986-6500
Aldus 800-333-2538
Apple 800-776-2333
Claris 408-727-9054
DeltaPoint 408-375-4700
Deneba 305-596-5644

Intuit 415-858-6040
Microsoft 206-454-2030
SuperMac 408-245-2202
Symantec Corporation 310-449-4990
Wolfram Research Inc. 217-398-0700

Note: LightSource (the developer of Ofoto) no longer offers phone support or software upgrades, and has no plans to revise Ofoto to be compatible with current versions of the Mac OS.

LaserWriter Pro Energy Star Software, Read Me

LaserWriter Pro Energy Star Software is available on the Apple Support Website, Apple Software Updates.
This article has been archived and is no longer updated by Apple.

Setting the Sleep Mode on LaserWriter Pro Printers

The contents of this disk allow you to set the sleep mode on a LaserWriter Pro printer. The sleep mode is the period of time a printer waits when not printing before going to sleep. In sleep mode, the LaserWriter Pro printer use approximately 70% less power than when in normal idle mode. To set the period of time before the LaserWriter Pro printer goes to sleep, perform the following steps:

1. Select the desired printer in the Chooser.
2. Double-click on the LaserWriter Utility icon.
3. Select Download PostScript File... from the Utilities menu.
4. Double-click on the file corresponding to the length of time you would would like the LaserWriter Pro printer to wait before going to sleep. For example, to select 30 minutes, double-click on the file named 30 Minute Sleep Mode.
5. The next dialog asks you to Save PostScript output as a file. For most users, the default name PostScript Log is acceptable, so just click on the Save. If you have previously set the sleep mode, another dialog box will appear asking if you would like to Replace or Cancel, click on Replace.
6. Print any page. One interesting page to print from within the LaserWriter Utility is the Configuration Page. To print it, select Print Configuration Page from the Utilities menu. Then click on Print in the next dialog box.

You have now set the sleep mode on the LaserWriter Pro printer. After the printer has not printed for the sleep mode period you have set, the printer will go to sleep. The first page you send when the printer is sleeping will take approximately 30 seconds longer to print than when not in sleeping. In essence it takes 30 seconds for the printer to wake up.

About Portable StyleWriter Version 1.01, Read Me

This article comprises the Read Me document found with the Portable StyleWriter Update 1.0.1. This update was released on January 1993. This article has been archived and is no longer updated by Apple.

PORTABLE STYLEWRITER

SYSTEM REQUIREMENTS

Your Portable StyleWriter printer works with Macintosh computers with system software version 7.0 or later installed, and that have hard disk drives with sufficient available space (the Installer will check the space on your hard drive and tell you if you don't have enough).

MACINTOSH COMPUTERS WITH LOW MEMORY

In order to use the background printing feature of the Portable StyleWriter software, your computer should have at least 2 megabytes of RAM installed. If you do not have at least 2 megabytes of RAM installed in your computer, you should leave the "Background Printing" selection in the Chooser set to "off".

PRINTING TIPS

Follow these suggestions to get the best results with your Portable StyleWriter:

- It is recommended that you select Print Quality as Faster in the Print Dialog box because it gives you the fastest printing and good print quality. For the best print quality but longer printing times, set this selection to Best.
- If you have more that 2 megabytes of RAM in your computer, it's a good idea to use background printing. This allows you to continue working on your Macintosh while the Portable StyleWriter is printing. (To turn on Background Printing, choose the Chooser from the Apple menu. In the Chooser window, click the Portable StyleWriter icon, then click the On button next to Background Printing.)
- If you use the Portable StyleWriter with a PowerBook 100, you must connect it to the Printer port; the Modem port is internal on the PowerBook 100. Be sure to select the Printer serial port in the Chooser after you install.
- If you are using a PowerBook Duo computer which is NOT docked while printing to the Portable StyleWriter, the modem port must be selected and AppleTalk must be set to "inactive" in the Chooser. If you have an internal modem installed, you should also verify that the Portable Control Panel (accessible from the Apple menu) has the port set to "external"
- Close the Chooser after making any printer set-up changes.

PICT2: Resource Fork Versus Data Fork Storage

I need some information on PICT2 data structure. I do digital photo-retouching frequently creates individual files 20MB to 30MB, or larger, especially when scanning at 4000 lines per inch.

I use film recorders, most of which are QuickDraw-based and accept PICT2 as input. I had a problem trying to create a 20MB PICT2 file from my scanning and retouching software (BarneyScan XP and PhotoShop). Is this a problem with the image software, or is it a PICT2 limitation?

We examined the PICT2 documentation in "Inside Macintosh, Volume 5." In PICT2, the picture length in the header is ignored (set to -1). Does this mean that this is variable data length?

This article has been archived and is no longer updated by Apple.

```
The limitation that you are most likely running into is a resource size
limitation rather than a PICT2 format limitation.  If the application stores
the pictures in the file's resource fork (as a PICT resource), it is
understandable that you can't create a 20MB picture.  The maximum size of a
file's resource fork is 16MB.  This is because a 3-byte number is used by the
Resource Manager to offset into the resource map.

If your application can store the images in a format that uses the file's data
fork, you should be able to create and use images larger than 16MB.
```

Adding New Address Doesn‘t Check for Existing Names

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When you click the plus button in an Inbox Item to add an address to the Address Book, Emailer checks if there is already a record for that email address, but it doesn't check to see if there is already a record for that person's name.

Therefore, if a person changes their email address, a new record will be added for them and you will still have a record for their old address.

Configuring Apple Express Modems

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Some PowerBooks, AV Macs, and PowerMacs come with Express Modems built in.

If you have an Express Modem, use the Express Modem tool rather than the Apple Modem tool to connect with services via Claris Emailer. To change modem tools, choose Services from the Setup menu, open a service, click the Configure button, and select Express Modem Tool from the Method popup menu. Then fill in the phone number.

In general, you can leave all other settings on their defaults. However, if you are having problems connecting, try turning off the handshake XON/XOFF checkbox. Also make sure that you don't have the minimum connection speed set to a high value. This should be set to 2400 or lower. If you have it set to 14,400 and you connect at 9600, the connection will be terminated since it isn't 14,400 or more.

Setting Data Features to Best Available is another thing to try when experiencing connection problems. This instructs the modem to negotiate the appropriate protocol based on the capabilities of modem it is connecting with.

TA43431_LaserWriter_II_Printing_x_Labels_a_Workaround_(TIL05669).pdf

LaserWriter II: Printing 3x5 Labels, a Workaround

Do you have any kind of workaround for printing 3x5 labels on the LaserWriter II?

This article has been archived and is no longer updated by Apple.
We constructed a "carrier" for small forms. It is a piece of heavy paper (about the same weight paper as 3x5 stock) cut to the size of a standard envelope. It has a hole cut in it to print through and a standard piece of paper glued to the back that adequately holds the small form in place. The small form slides into place, and then We feed the carrier manually.

We do not propose this as a solution for the problem. It is much too much trouble for large quantities. It does work very well when printing single labels or small forms. We can even print individual disk labels with this method. To make it even easier, we created a MacDraw II template that shows me exactly where the window on the carrier is. We used the template to create the carrier.

If this idea could be developed into a useful solution by some industrious person, we wouldn't mind if they used it.

Connection Fails Without Even Dialing Modem and Generates Empty File Named "False" on the Desktop

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If a Connection to AOL or CompuServe fails very quickly, without even dialing the modem, and a file named "False" is created on your desktop, you most likely have an older version of the Apple Modem Tool installed. To see if this is the case, open the System folder and then the Extensions folder. Select the Apple Modem Tool and choose Get Info from the File menu. If the file is a version earlier than 1.5.3, drag the file to the trash and run the Claris Emailer Installer again. As long as your Claris Emailer Folder is still on the main level of your hard drive, re-installing will preserve all your settings.

After doing an Easy Install, Quit the Installer, throw away the "False" file, launch Claris Emailer again, and open up any services you have accounts on (AOL or CompuServe). Click the Configure button for each service and make sure you see the version number 1.5.3 or later above the port selection area. Confirm that the phone number and modem type are correct and press OK.

This should fix the problem.

Open Transport MacPPP Tip

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you are running Open Transport and you close a MacPPP connection, you will not be able to re-open the connection simply by trying to connect again. This issue is caused by a failure in the mechanism that the dialup SLIP/PPP software uses to inform Open Transport that a new IP address has been obtained. When you disconnect and reconnect, Open Transport still thinks you have your old IP address. If your terminal server assigns you a different one when you reconnect, nothing works. Apple says this will be fixed in version 1.1. To work around this issue you can use the Options dialog box in the TCP/IP control panel to force the Open Transport TCP/IP portion to unload and reload. Then you will be able to connect again without having to restart your computer.

Returning Day Names and Weekday Numbers

Four different Calculations to use in Spreadsheets and Databases in ClarisWorks, and Tables in ClarisImpact

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

To obtain a day name such as "Monday" based upon a date entered into a cell (in a spreadsheet in ClarisWorks, a table in ClarisImpact, or a field in a ClarisWorks database) you need to create specific calculations to do this. There is no built-in menu function in ClarisWorks or ClarisImpact that generates the day of the week automatically. There are four different calculations to use that will return the desired result.

Spreadsheet or table

In a spreadsheet or table, you can return a day name or you can return the weekday number that it represents (1 through 7). The following examples assume that cell A1 is a date and A2 is the result.

1. To return the dayÕs name, use this calculation for cell A2:

=DAYNAME(WEEKDAY(A1))

Cell A1 has an entry of 1/14/96 that returns "Sunday" in cell A2.

2. To return the weekday number that the date represents, use the following for a week that begins with Monday as day 1 and ends with Sunday as day 7:

=IF(WEEKDAY(A1)=1, 7, WEEKDAY(A1)-1)

Cell A1 with the entry of 1/14/96 will return the

number 7 in cell A2.

3. To return a weekday number that begins with Sunday as day 1 and ends with Saturday as day 7, use the following:

=WEEKDAY(A1)

The entry of 1/14/96 in cell A1 returns the number 1 in cell A2.

4. If you want the weekday number to be returned with Sunday beginning as day 0 and ending with Saturday as day 6, the following will apply:

=WEEKDAY(A1)-1

Cell A1 with the entry of 1/14/96 returns the number 0 in cell A2.

Database

The calculations are slightly different than those in a spreadsheet or a table. Define the fields as follows, (assuming that "datefield' is where the date is entered and "weekname' or whatever you choose as a name will have these calculation(s) defined):

1. To return the day's name, use the following calculation:

DAYNAME(WEEKDAY('datefield'))

The "datefield' entry of 1/14/96 will return "Sunday" in the Ôweekname' field.

2. To return the weekday number that the date represents, use the following for a week that begins with Monday as day 1 and ends with Sunday as day 7:

IF(WEEKDAY('datefield')=1, 7, WEEKDAY('datefield')-1)

The "datefield" entry of 1/14/96 will return the number 7.

3. To return a weekday number that begins with Sunday as day 1 and ends with Saturday

as day 7 use the following:

WEEKDAY('datefield')

The "datefield" entry of 1/14/96 will return the
number 1.

4. If you want the weekday number to be returned with Sunday beginning as day 0 and
Saturday as day 6, the following will apply:

WEEKDAY('datefield')-1

The "datefield" entry of 1/14/96 will return the
number 0.

Note: In FileMaker Pro there is a calculation function called DAYNAME (date field) that does return the values Monday through Friday in a single step.

Fill Special Dates Incremented By Month Does Not Fill Correctly

Using day numbers greater than 28 in conjunction with Fill Special will produce undesired results.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
In ClarisWorks 4.0 and ClarisImpact 2.0 Fill Special does not fill correct dates when incrementing by one month and choosing a day that may not be present in all months.

Exact steps to reproduce:
1) Create a SS (In ClarisImpact create a Table)
2) Enter 12/31/95 in cell A1
3) Select row A1 through A4
4) Select Fill Special from the Calculate menu (From Table menu in ClarisImpact)
5) Choose Date increment by 1 month

The result is 12/31/95, 1/31/95, 3/2/95, 4/2/95. Fill Special can't find the end of the month and back up to it. Instead, it will fill with the wrong date for months after the first short month.

This happens with any date that cannot be found in the subsequent month. Another example would be beginning with 12/29/96, it doesn't find a 29th in February of 1997, so it drops that whole month and begins with 3/1/96 after that.

Conclusion: Using dates that range between a day number of 1-28 is safe, but this issue will show itself with day numbers 29-31 as those are days of that month that vary from month to month and year to year.

Apple Internet Dialer, Internet Configuration System and Claris Emailer Lite

These 3 applications,included in the Apple Internet Connection Kit, enable you to change your mail settings. This article explains how they all relate to each other.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Apple Internet Dialer

The Apple Internet Dialer walks you through a process of choosing an Internet Service Provider or specifying one that you already use. When you save those settings at the end of the process, the Apple Internet Dialer modifies the Internet Configuration System settings file. The Apple Internet Dialer provides a more friendly interface than the Internet Configuration System by explaining each step for you.

Internet Configuration System

Also known as Internet Config, this application stores all your Internet settings in a central file so that they are accessible to all Internet applications which provide support for Internet Config. The benefit to you is that you only have to type your settings once. You can find Internet Config in the Utilities folder in the Internet Connection Kit folder. If you ever need to change your Internet settings, you may find it easier to use Internet Config rather than click Next, Next, Next through all the Apple Internet Dialer windows.

Claris Emailer Lite

Claris Emailer Lite uses the Internet Configuration System settings to pick up and send mail. You can see this by choosing Internet Setup from the Setup menu in Claris Emailer Lite. Notice that the checkbox labelled "Use Internet Configuration System" is checked. This means that Claris Emailer is getting its settings from a configuration file modifed by the Apple Internet Dialer. All fields except for the Account name field are grayed out indicating that you cannot type in them. You can however, uncheck the checkbox and manually enter settings straight into Claris Emailer Lite. The Account name field is simply a label that Claris Emailer uses for the Send Mail Via column in a new mail message. The full version of Claris Emailer supports several accounts, which makes the account name field necessary.

TA43439_RasterOps_Card_Upgrade_Available_(TIL05671).pdf

RasterOps 224 Card: Upgrade Available

When the RasterOps 224 card was first announced and shipped, the field offices received one for demonstration purposes.

I have found this card to be a good 24-bit solution on the AppleColor High-Resolution RGB Monitor, but the card seems to crash often. I called RasterOps and found that we have old ROMs.

The Tech Support Manager said that RasterOps would upgrade the cards sent to the field at no charge.

This article has been archived and is no longer updated by Apple.

We spoke with RasterOps Tech Support and confirmed that they would upgrade the cards we shipped to the field. Contact RasterOps to get version 1.43 of the ROMs and version 1.5 of the Graphics System Software.

About ClarisWorks 4.0v2 Mac Updater, Read Me

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

WELCOME TO CLARISWORKS 4.0v2!

Thank you for choosing the ClarisWorks(R) 4.0 application. We're pleased to provide the ClarisWorks 4.0v2 Update, which has additional important features and addresses a few known issues with v1. Once you've installed the update, it will provide better Macintosh Drag and Drop support, backward file conversion, and more.

This document provides information about:

I. Installing the ClarisWorks 4.0v2 updates
II. Problems and issues addressed in v2
III. New features in ClarisWorks 4.0v2

I. INSTALLING THE CLARISWORKS 4.0v2 UPDATES

To update the ClarisWorks 4.0v1 product currently installed on your computer:
1. Put the ClarisWorks 4.0v2 Update disk in your floppy drive.
2. Double-click the ClarisWorks Update Installer icon.
3. Choose Easy Install (to install all of the new v2 components except the ClarisWorks File Converter) or Custom Install (if you want to specify which components to install), and then click Install.
Once installation is complete, the process of updating your existing ClarisWorks 4.0v1 application itself will begin.
4. Select the copy of the ClarisWorks 4.0v1 application to update and then click Update.
The installation process finishes and the application is updated.

Note: To install the ClarisWorks File Converter application, you must choose it from the Custom Install list. For more on using the ClarisWorks File Converter, see the document "Read Me - CW File Converter".

II. PROBLEMS AND ISSUES ADDRESSED IN V2

This v2 Updater addresses several issues from version 4.0v1:
* Mail Merge and Multiple Line Data. In v2, when a mail merge field contains multiple lines of text, the text now merges and prints correctly. (The text still displays as a single line on the screen.)
* Mail Merge and Sliding over Empty Fields. In v2, when there is an empty mail merge field on a line by itself, the following text moves up appropriately and prints correctly. (The text does not "slide" on the screen.)
* Rotating Library Images. In v1, some of the ReadyArt(TM) library images didn't rotate correctly. This was fixed in v2.
* Stationery Corrections. Minor changes were made to some of the stationery files.
* Address List Assistant. Minor changes were made to the Address List Assistant for better printing and on-screen display.
* New RTF filter.
* Faster Word Count
* Option left/right arrows in WP now correctly skips carriage returns and tabs (as it did in versions prior to 4.0).
* New Document dialog now displays more quickly, especially when there are many stationery files in the ClarisWorks Stationery folder.
* Word Services AppleEvent Support. In v2, it is easier to use applications that support the Word Services AppleEvent standard (such as some third party spelling or grammar checkers).

To enable the Word Services command in the Edit:Writing Tools menu of the ClarisWorks word processor:
1. Select Preferences from the Edit menu.
2. Select the Text icon.
3. Check the Word Services checkbox under General and click OK.

To select a Word Services application for use with ClarisWorks:
1. Open or create a word processing document.
2. Select Writing Tools from the Edit menu and then select Edit Word Services.
You see a dialog containing a list of all the Word Services applications for which ClarisWorks is currently configured.
3. Press the Add button.
You see a dialog listing the applications running on your Macintosh that use Word Services AppleEvent standard.
4. Select the one you want and click OK.
5. In the Word Services dialog, click OK.
A new menu item corresponding to the Word Services application you chose appears in the Writing Tools menu.

You can also use the Edit Word Services dialog to remove installed Word Services applications from the Writing Tools menu.

To use a Word Services application on a ClarisWorks word processing document, choose the appropriate menu item from the Writing Tools menu. This launches the Word Services application if is not already running. If you have text selected in the document, then the Word Services application checks the selection. Otherwise, the entire document is checked.

III.NEW FEATURES IN CLARISWORKS 4.0V2

In addition to resolving some known problems in v1, the v2 revision also adds new features, including:

* Macintosh Drag and Drop Support. In v2, users can use Macintosh Drag and Drop (that comes with System 7.5) to move text, graphic objects, and spreadsheet cells within ClarisWorks 4.0 documents, drag selections from one document to another, drag selections to other applications (including creating clipping files in the Finder).
* Backwards File Conversion to 2.0/2.1/3.0 Formats. You can use the new ClarisWorks File Converter application to save version 4.0 files in the format used by ClarisWorks versions 2.0, 2.1 and 3.0. For more on the File Converter, see the file "Read Me - CW File Converter".
* New filter for WordPerfect 3.1 for Macintosh.

Claris(R) and the ClarisWorks team thank you for your purchase of ClarisWorks 4.0. Your support, comments, and suggestions help us to continue to bring you better solutions for your future productivity needs.

ABOUT THE CLARISWORKS 4.0 TO 2.X/3.0 FILE CONVERTER, Read Me

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

ABOUT THE CLARISWORKS 4.0 TO 2.X/3.0 FILE CONVERTER

The ClarisWorks 4.0 to 2.x/3.0 File Converter enables users of the ClarisWorks(R) 4.0 application to share their documents with earlier versions of ClarisWorks. ClarisWorks 2.0, 2.1, and 3.0 cannot directly open files created by ClarisWorks 4.0; the File Converter can change ClarisWorks 4.0 files to the format read by ClarisWorks 2.0, 2.1, or 3.0, which all share the same file format. This document explains how to use the File Converter and how features unique to version 4.0 are converted to the 2.x/3.0 file format. ClarisWorks 2.0, 2.1, and 3.0 use a common file format. This is referred to as the 2.x/3.0 file format.

The File Converter is a separate application and does not require any version of ClarisWorks to be on your computer. The File Converter runs on any Macintosh on which ClarisWorks 2.x/3.0 can run, i.e., 68000 (that is, Macintosh Plus, SE, Classic, PowerBook 100, etc.) or higher Macintosh and Power Macintosh computers.

Important Note: The File Converter adds the suffix "[v3.0]" to the filename of converted files (documents); for example, "MyLetter" becomes "MyLetter [v3.0]". The original ClarisWorks 4.0 file remains unchanged and intact. ** It is always a safe practice to make a backup copy of each file that you want to convert, and to work with the copy.

INSTALLING THE SOFTWARE
The File Converter is installed by selecting it from the Custom Install list when running the Installer from either the ClarisWorks 4.0v2 installation disks or the ClarisWorks 4.0v2 Update disk.

Use these steps ONLY if you are installing the File Converter from a stand-alone File Converter disk (available separately):
1. Insert the File Converter disk into the 3.5-inch disk drive and double-click the disk icon to open it.
2. Drag the application from the File Converter disk to a folder on your computer.

CONVERTING FILES--METHOD I
Use Method I if you're using System 7.0 or later. (If you want to specify the names or location of the converted files, or if you're using System 6.0, use the directions under CONVERTING FILES--METHOD II.)

1. Click to select the ClarisWorks 4.0 file you want to convert. Shift-click to select multiple files.
2. Drag the selected files to the File Converter icon and release the mouse button when the Converter icon becomes shaded.

The File Converter converts the files to 2.x/3.0 format and saves them in the same folder as the original files. The File Converter adds "[v3.0]" to the end of the filename.

CONVERTING FILES--METHOD II
Use Method II if you're using System 6.0, or if you want to specify the names or locations of the converted files.

1. Double-click the File Converter icon.
2. In the Open dialog box, select the ClarisWorks 4.0 file you want to convert, and then click Open to initiate the conversion.
3. In the Save As dialog box, enter a name and choose a folder for the converted file, and then click Save.
4. To convert another file, choose Convert from the File menu, and repeat steps 2 and 3.

HOW THE FILE CONVERTER HANDLES CLARISWORKS 4.0 FEATURES
Several ClarisWorks 4.0 features, such as sections in word-processing files and pop-up fields in databases, were not available in ClarisWorks 2.0, 2.1, and 3.0. The converted documents may need to be reformatted so that they display and print correctly. Refer to the following list for specific details on how the File Converter converts ClarisWorks 4.0 features.

All Environments:
* New shortcuts and macros are not supported.
* Superior and Inferior font styles become Superscript and Subscript font styles.
* Double underline font style becomes single underline font style.
* Paragraph styles: Text, paragraph, and line spacing attributes are retained.
* Outline styles: Text, paragraph, and line spacing attributes are retained in non-outline view; labels are retained in outline view.
* Table styles: All attributes except color border and cell shading are retained.
* Basic styles: All attributes are retained.
* Auto-hyphenation is turned off in the converted document.

Word Processing:

* Section formatting: Attributes of the first section are applied to the entire document.
* Section breaks become Page/Column breaks.
* Section number-page count becomes a document page number.
* Document page count becomes a document page number.
* Endnotes become footnotes.
* Left and right headers and footers become left headers and footers.
* Mirrored facing pages: The inside margin becomes the left margin and the outside margin becomes the right margin.
* Left/Right facing pages are not supported.
* Mail merge fields are replaced with a "#" as a place holder.
* Paragraph labels are displayed only when the document is in outline view.
* The alignment of inline equations (created by EGO-aware editors) may change.

Spreadsheet:
* Colors and patterns applied to cells are not supported.
* Colored cell borders become black cell borders.
* Fill Special: Cells filled using the Fill Special command retain their data.
* BaseToNum and NumToBase functions: Cells containing the results of BaseToNum and NumToBase functions retain their values.

Drawing:
* Rotated objects are rotated to nearest 90 degree angle.
* Fill patterns and gradients applied to text frames become opaque.

Database:
* List view and saved searches, sorts, and reports are not supported.
* Radio Buttons and Popup Menu field types are retained as Text fields with a value list.
* Value List fields are retained as Text fields with a value list.
* Check Box fields become Number fields. The number is 0 if the field was unchecked and 1 if the field was checked.
* Serial Number fields become Number fields set up for serial number entry.
* Name fields become Text fields; any data is retained.
* Record Info fields: If the field options were set to Date Created or Date Last Modified, the field becomes a Date field. If the field options were set to Time Created or Time Last Modified, the field becomes a Time field. If the field options were set to Name of Creator or Name of Modifier, the field becomes a Text field.

How to Scale a Paint Object by Percentage

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

A paint (bitmap) object that's pasted into a word processing, drawing or spreadsheet document cannot normally be scaled by percentage. If you select the object and move a handle, the object will crop rather than scale. However, if you use the Insert command to insert a PICT, TIFF or EPSF file, that graphic can be scaled by percent using these step:

1. Paste the object into a blank drawing document. Choose Save As, and save the document as a PICT file.
2. Go to the document you want to place the graphic into (a word processing, drawing or spreadsheet document).
3. Select the arrow tool in the toolbar.
4. Choose Insert from the File menu and insert the PICT file.
5. Select the graphic.
6. Choose Transform from the Arrange menu, and select Scale by Percent.

ImageWriter II: How Draft Mode Handles Fonts and Layout

Does the ImageWriter II have any built-in fonts? What font is used when the Draft option is selected? I printed in Draft mode from Microsoft Word 4.0, using both Palatino and Garamond, and the printouts were different. That is, the spacing between words was inconsistent.

Can you explain?

This article has been archived and is no longer updated by Apple.
There are fonts built into the ImageWriter II ROMs. They are very simple character fonts with limited quality. Because these fonts are resident in the printer, they can print very quickly compared to the bitmaps sent to the ImageWriter for Faster or Best modes. With a Macintosh, the built-in fonts are used only when printing in Draft mode or when an application bypasses the Macintosh print driver.

Draft mode allows very fast printing of documents, giving a best-guess layout of characters and lines. Because this mode uses the built-in fonts, it cannot duplicate the spacing and effects visible on the Macintosh screen and is, therefore, not intended for anything other than rough drafts.

The best way to improve the print layout with Draft mode is to use a screen font that approximates the ImageWriter fonts used. The ImageWriter fonts are pica or elite in various sizes between 9 and 17 characters per inch. A list of the fonts used is on page 74 of the "ImageWriter II Owner's Manual."

Matching different screen fonts to printer fonts requires experimentation. Because Draft mode was not designed for optimal appearance, use it only for rough-draft output.

About ClarisDraw Version 1.0v2 Macintosh, Read Me

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisDraw Important Information - 1.0v2

This file contains last-minute information that will help you get more from ClarisDraw. You will also find important tips in the "Troubleshooting" section of ClarisDraw's onscreen Help.

Hard Disk Space Needed During Installation

To save hard disk space, the "Easy install" option places all ClarisDraw files and only a minimal set of ClarisArt files on your hard disk. To install all of the ClarisArt files, relaunch the Installer, go to "Custom" install, and select the 'ClarisDraw ClarisArt' option.

During installation, ClarisDraw will temporarily require more hard disk space than it needs after installation is completed. This is because, during installation, the ClarisDraw Installer places compressed copies of the ClarisDraw files on the hard disk, then makes decompressed copies of these files. Once installation is successfully completed, the Installer automatically deletes the compressed files and leaves only the new, uncompressed files for your use.

Power Macintosh Installation

The "Easy Install" option places on your hard disk the appropriate Macintosh or Power Macintosh version of ClarisDraw, depending on the Macintosh being used. If you'd like to install both the Macintosh and Power Macintosh versions on any machine, use the following steps:

* Use the Easy Install option to install one complete set of files, then Quit the Installer.

* Open the 'ClarisDraw Folder' that was just installed and rename the ClarisDraw application appropriately (example: 'CD Macintosh' or 'CD Power Macintosh')

* Open the Installer a second time, choose "Custom" and select either 'ClarisDraw Application Macintosh' or 'ClarisDraw Application Power Macintosh', depending on the version previously installed.

When this installation is completed, both applications will be located in the same folder and will use the same auxiliary files.

Important: The Power Macintosh version will not run on a conventional Macintosh.

Memory

Occasionally in low memory situations an alert will appear stating "There is not enough memory to complete this operation". This is particularly common when working with paint frames, and is typical of any application with a paint feature. We suggest saving your document before continuing. If you are working with large documents and find yourself in this situation frequently, we suggest increasing the application's memory partition as described in the ClarisDraw onscreen help, or your Macintosh User's Guide.

Bad Fonts

ClarisDraw tests for bad fonts when the application is first opened. It also tests for bad fonts when opening the application after fonts have been added to your system. ClarisDraw creates a 'Claris Fonts' file which is used to display fonts in their actual typeface in the Font menu. If ClarisDraw encounters a bad font, or one that it cannot correctly add to the Claris Fonts file, an alert is displayed indicating that some fonts may be bad. These fonts will be listed in a 'Bad Fonts' text file in the Claris Folder, which is located in your System Folder. Additionally, these fonts will be displayed in the Chicago font in ClarisDraw's FONT menu. We suggest removing or replacing these fonts from your system before using ClarisDraw. Refer to the manual that came with your Macintosh for instructions on how to remove or replace these fonts. Once these fonts have been removed or replaced, throw away the 'Claris Fonts' file, also located in the Claris folder, and open ClarisDraw.

There may be some fonts that work properly in ClarisDraw and still fail our tests. The only difference between these and other fonts is that they will be displayed in the Chicago font in the FONT menu. However, we suggest performing the following simple tests on these fonts before using them in the application:

1) Create some text in ClarisDraw and apply the font. If the application unexpectedly quits, this font is bad and should be removed or replaced immediately.

2) If the application does not quit when the font is applied, create multiple pieces of text, apply several different font sizes, and print the file. If the font appears correctly on screen and when printed, then there is no need to replace or remove this font.

Exporting Documents with Bezigons Created from Text

If you create a document that includes bezigons created from text, and then save this document in EPSF, CGM, MacDraw Pro or MacDraw II format, you may see extra lines in the converted document, both onscreen and when printing. This is a limitation of Apple's "QuickDraw" object-drawing technology.

Opening or Saving Color Palettes

ClarisDraw ships with several specialized 256-color palettes. You can access these palettes by opening them from the "Colors & Gradients" dialog box in the LAYOUT menu. Make sure that you select the 256-color palette first; the "Open" and "Save" buttons will then become available.

Illuminated Letters Library

If your drawing includes objects from the Illuminated Letters library, and you need to scale these letters, for best results do not resize a letter by manually stretching it. If you do that, the letter or number background will scale accurately, but the enclosed letter or number will not because it is an actual piece of text. Instead, use the "Scale Selection" feature from the ARRANGE menu, with the "Scale text" option selected.

ClarisImpact Users:

If you own ClarisImpact, you can save a considerable amount of disk space by not installing the ClarisArt files for ClarisDraw. Both products include the same library files.

However, if you do install the ClarisArt libraries that come with ClarisDraw, to use them with ClarisImpact, you'll need to have ClarisImpact version 1.0v4 (or greater). Earlier versions of ClarisImpact cannot read library files in ClarisDraw's format.

If you own a version of ClarisImpact earlier than 1.0v4, contact Claris Customer Assistance for a maintenance release at (408) 727-8227, from 8 a.m.-5 p.m., Pacific time, Monday-Thursday (8 a.m.-2 p.m. Pacific time on Fridays). You'll also find this maintenance release on America Online, CompuServe, eWorld, AppleLink, and the Claris BBS (408-987-7421).

If you decide to use the same library set for ClarisDraw and ClarisImpact, remember that each application has certain kinds of objects that do not exist in the other. This can be a consideration under some circumstances.

For example, if you have text bound to a curve in ClarisDraw, and you then save that bound-text object to a library, if you open that library in ClarisImpact, the bound-text object will look the same, but if you ungroup it the text and the object it is bound to will all be separate objects. If you then save the library in ClarisImpact format and open it in ClarisDraw, you will not be able to unbind the text from the object. This is because the "Bind Text" feature is available in ClarisDraw, but not in ClarisImpact.

Similarly, if you place a "model" object from ClarisImpact into a library, then open that library in ClarisDraw, you will be able to place those objects into your document, but they will only be pictures - not the active models they are in ClarisImpact. This is because models are only available within ClarisImpact, not ClarisDraw. More importantly, if you modify the library and save it from within ClarisDraw, your models will look the same, but they will have lost their model functionality when you try to place them from the library into a ClarisImpact document. You'll be able to edit these objects with the drawing tools, but you won't be able to change them with the model tools. To avoid this, if you are using ClarisDraw and have opened a library containing ClarisImpact models, save any changes to a separate copy of the library. Use the "Save As" command under the Library's FILE menu.

ClarisDraw 1.0v2 Detailed Improvements

Claris periodically issues maintenance releases of shipping software applications. A maintenance release is identified by v2, v3, v4, etc. numbering. The improvements made in ClarisDraw 1.0v2 are included in this package and are detailed below.

Improved Translation of MacDraw Pro Files
* Text blocks import with correct size, and without wrapping
* Document size and page orientation information are properly imported
* Extremely fine pen sizes import at ClarisDraw's minimum available size, rather than being imported at a pen width of zero.
* MacDraw II and MacDraw Pro documents with rotated polygons import with all polygons accurately placed
* Objects in MacDraw Pro files opened in ClarisDraw for Power Macintosh print properly to Postscript printers.
* MacDraw Pro files containing PICT objects import completely and with correct size and proportion

Improved compatibility with ClarisImpact
* Imported ClarisImpact files retain correct ruler settings
* ClarisImpact files with rotated models, groups or tables import properly
* ClarisImpact files with all objects locked import properly

Import and Export Improvements
* Text in files saved as a PICT, then reopened and ungrouped, retains its proper color
* Pen size is properly translated when exported to CGM format

* Arrowheads properly export to CGM format
* Inappropriate "insufficient memory" error dialog eliminated when saving large PICT files as MacDraw II or MacDraw Pro.
* Resolution of bitmapped images properly preserved when exporting to MacDraw II or MacDraw Pro
* Black and white (one-bit) files export to EPSF with only the necessary information, so they remain reasonable in size
* White text, copied to the Clipboard along with colored text, does not change the way colored text is displayed on screen after you switch to the Finder and back
* QuickTime movies export properly

Improved Printing
* Print range settings work properly with slides and handouts
* Rotated, colored text prints properly with the Apple LaserWriter 7.x driver
* Polygons and bezigons print and display properly when exported or copied from ClarisDraw, then imported or pasted into other applications and printed to a Hewlett-Packard DeskWriter printer

System Conflict
* Memory is properly managed so closing Desk Accessories after use no longer causes a operating system conflict.
* Pop-up tools are now properly available when using System 7.1 on a Macintosh Plus, SE, Classic, PowerBook 100, or Portable

Miscellaneous
* The CommercialPi BT font displays correctly in the Font menu and in text
* ClarisDraw properly launches with a wider variety of corrupted fonts installed
* Proper line spacing is preserved even if a single line of text contains characters of varying point sizes, and line spacing is changed to a measurement other than Lines
* Objects snap correctly to the grid under a wider variety of situations
* Screen objects display properly after using the spell checker while viewing the Master Slide
* Colors in the gradient editor display properly when in paint mode with a paint frame set for thousands or millions of colors
* Library object "thumbnails" retain their proper size in Name View

About Version 2.0 Macintosh, Read Me

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

WELCOME TO CLARISIMPACT 2.0!

Thank you for choosing ClarisImpact(R) 2.0. This Important Information file documents some additional tips that may prove helpful when using ClarisImpact 2.0, including changes for users of previous versions of the program. This document provides information on:

I. Technical notes and tips
II. New features in ClarisImpact 2.0

I. TECHNICAL NOTES AND TIPS

A. Using ClarisImpact 1.0 and 2.0 on the same Macintosh
Some users may want to have both versions 1.0 and 2.0 on their Macintosh. (You might choose to do this if others in your organization have older versions of ClarisImpact.) If you plan to run both versions on your Macintosh, keep the following in mind:

- Version 2.0 uses the same desktop information as version 1.0, so documents created in ClarisImpact 1.0 will show the ClarisImpact 2.0 document icons. When you double click these icons, they will automatically open in ClarisImpact 2.0. If you want to keep your 1.0 documents in 1.0 format, start ClarisImpact 1.0 and use the open menu item instead of double clicking the document icons.

For the same reason, the ClarisImpact 1.0 application will show the version 2.0 application icon on the desktop. Rename ClarisImpact 1.0 and ClarisImpact 2.0 applications accordingly to avoid getting them confused.

- ClarisImpact 2.0 has a different file format than ClarisImpact 1.0. When you open a ClarisImpact 1.0 document with version 2.0, the document is converted to 2.0 format. This automatic conversion is indicated by the "- Converted" extension in the filename. If you save the converted file with a new name, the original 1.0 version is left intact.

After a file has been saved with version 2.0, it cannot be opened with version 1.0. Therefore, you should keep copies of important documents in 1.0 format if you or another user might need to access them using version 1.0 in the future.

B. Converting ClarisImpact 1.0 Styles to ClarisImpact 2.0 Style.
To update ClarisImpact 1.0 Color Styles and ClarisImpact B&W Styles to ClarisImpact 2.0 format, you need to follow the instructions located on page 4 of the Installation Guide. When following these instructions, you will likely encounter a -48 error after step 3. Okay the alert and continue with the rest of the instructions.
The -48 error is the result of attempting to combine the ClarisImpact 1.0 9" SE Slides and 10" PowerBook Slides to a single Custom slide file. If you did not use these slide styles in ClarisImpact 1.0, there is no need to continue. However, if you wish to use one or both of these files with ClarisImpact 2.0, quit ClarisImpact and use the following steps.

To convet 9" SE Slides and 10" PowerBook Slides files to ClarisImpact 2.0:
1. Make a copy of the original 9" SE Slide file.
2. Rename the file "Custom".
3. Copy the file to the folder created in step 8 of the Installation guide.
4. Make a copy of the original 10" PowerBook Slide file.
5. Rename the file "Custom".
6. Create a new folder in the CIStyles folder named "10" PowerBook Slide"
7. Copy the Custom file from step 5 to this folder.

The 9" SE Slide styles are accessed by selecting Custom from the slide size pop-up menu and the appropriate folder from the Style pop-up menu in the Presentation precreation dialog.
The 10" PowerBook Slide styles are accessed by selecting Custom from the slide size pop-up menu and the 10" PowerBook Slides from the Styles pop-up menu.

C. Sharing files with ClarisImpact 2.0 for Windows
ClarisImpact 2.0 for Macintosh has the same file format, user interface, and feature set as ClarisImpact 2.0 for Windows. You can create a ClarisImpact document on Windows and edit it on a Macintosh computer, or vice versa. Therefore, if you work with both Macintosh and Windows versions of ClarisImpact, or if you collaborate with colleagues who use ClarisImpact 2.0 for Windows, you can work without translating files or learning a different program.

However, if you want to transfer files between platforms via diskette, you must use a file transfer program such as PC Exchange, AccessPC, or a similar utility. These utilities require that your Macintosh have a high density drive (FDHD SuperDrive). Follow the directions in the documentation of the file transfer utility program. After copying the files to or from a PC-formatted disk, rename the files with DOS-compatible filenames (8 characters or less) and include the .CID extension (for ClarisImpact Library files, use the .CLB extension).

After renaming your files, you can copy them to your computer's hard drive and open them as you would any ClarisImpact document.

Fonts, margins, and page breaks may look different after they are transferred from Windows to the Macintosh. You can minimize unintended text changes by using the same fonts on both platforms. ClarisImpact provides several TrueType fonts that are common to both platforms. In addition to common fonts, ClarisImpact uses the Claris Font Map file located in the Claris folder to define Macintosh font substitutes for common Windows fonts. The Claris Font Map file is a basic text file that can be edited to add additional substitutions or modify the font mapping provided by ClarisImpact.

Font mapping syntax in the Claris Font Map file is:
<Windows font name>=<Macintosh font name>

ClarisImpact installs the following entries for you:

Arial=Helvetica
Courier New=Courier
Times New Roman=Times

To create a new font substitution, create a new line in the Claris Font Map file similar to those above. If you are unsure of the Windows font name, open the ClarisImpact file on the Macintosh and use the font name that is displayed in the uninstalled font dialog box for the variable <Windows font name>.

Note: Fonts are mapped and stored by name, so the names need to match exactly. If you have made unnecessary changes and would like to revert back the original Claris Font Map file, delete the Claris Font Map file and restart ClarisImpact. ClarisImpact recreates the Claris Font Map file automatically during start up if it is missing.

D. Adjusting ClarisImpact memory
In most cases, the preset memory allocation is adequate for working on ClarisImpact documents. However, if you are working with large drawing documents, very long documents, or if you have several large documents open at the same time, you may see the message "Not enough memory to complete this operation" or "The document has been reduced to fit the available memory." These messages mean that you need to increase the amount of memory set aside for ClarisImpact. Increasing the memory allocation may also reduce the time it takes to print some documents.

To increase the memory allocation for ClarisImpact:
1. If ClarisImpact is open, quit the application.
2. Open the folder that contains the ClarisImpact 2.0 application.
3. Click the ClarisImpact application icon once. (If you click the icon twice, you'll start ClarisImpact. If that happens, choose Quit from the File menu and try again.)
4. Choose Get Info from the File menu.
5. Double-click the Preferred Size box.
6. Type a larger number to increase the memory size.
7. Close the ClarisImpact Info window.

E. Software requirements for the DataDraw templates
If you want to use the database or spreadsheet templates that are installed in the DataDraw folder, you must have FileMaker(R) Pro or Microsoft Excel 5.0 installed on your system. Instructions for using each template are located on the Help screens in the FileMaker Pro and Excel template files.

F. Installing or multi-using from Novell Netware servers
If you intend to allow multiple users to install ClarisImpact or run ClarisImpact as a multi-user application from Novell Netware servers and are using System 7.1 or 7.5, then you need to reset the shared bit for the installer and/or the ClarisImpact application. This bit is preset in ClarisImpact, but the setting is cleared when the files are copied to a server if you are using the system versions and the Netware server named above.

You can reset the shared bit using either of the following two methods:

Method 1
Using the Netware Tools application, which comes with Novell Netware for Macintosh:
1. Make sure you have access privileges to change files.
2. Log onto the server.
3. Start Netware Tools.
4. Select File and Folder Flags from the Utility menu.
5. Select the ClarisImpact Installer, ClarisImpact - Macintosh, and/or ClarisImpact - Power Macintosh that you want to share.
6. Click Sharable.
7. Close the File and Folder Flags window.
8. Quit Netware Tools.

Method 2
Using ResEdit:
1. Make sure you have access privileges to change files on the server.
2. Log onto the server.
3. Start ResEdit.
4. Select Get File/Folder Info from the File menu.
5. Select the ClarisImpact Installer, ClarisImpact - Macintosh, and/or ClarisImpact - Power Macintosh that you want to share.
6. Click both Shared and Invisible in the Info window.
7. Select Save from the File menu.
8. Deselect the Invisible checkbox.
9. Select Save in the File menu.
10. Quit ResEdit.

II. NEW FEATURES IN CLARISIMPACT 2.0

A. Cross-platform support

ClarisImpact 2.0 is now available for Windows and Windows 95 as well as the Macintosh and the Power Macintosh. You can easily exchange files between platforms, because no file-format translation is needed.

B. Automated data transfer with DataDraw(TM)

You can automatically convert information from FileMaker Pro, Microsoft Excel, or any application that exports data to a text file into a number of supported ClarisImpact business graphics. DataDraw turns names, dates, and numbers into organization charts, timelines, tables, data charts, or calendars. Try it out with the templates provided in the DataDraw folder.

C. Enhanced styles

ClarisImpact styles have been professionally redesigned to reflect today's business standards. These pre-designed combinations of fonts and color schemes help you quickly communicate your data in an attractive graphic format.

D. Improved presentation builder

Organize your thoughts before they appear on your slides with the integrated ClarisImpact outliner. Use the slide sorter to view and rearrange your entire presentation at a glance. Include speaker notes that help you give your presentation. Add pizzazz to on-screen presentations with over 50 new slide transitions and slide markup.

E. More flowchart symbols

Create a wider variety of flowchart diagrams using nine symbol sets--7 more than version 1.0. New symbol sets include: Telecommunication and Transportation networks, Decision Trees, Brainstorming, Root Cause Analysis, Total Quality Management, and Block Diagrams.

F. New symbol creation controls on flowchart connectors

Redesigned flowcharts now include an indicator showing connector text placement and autogrow/autoshrink symbols. Create flowcharts faster and easier with these new connectors.

G. Flexible organization charts

Make complex organization charts fit where you need them. Quickly resize an entire organization chart by clicking and dragging while boxes in the chart automatically grow and shrink around text. The new Fit To Page feature prints an organization chart of any size on one page.

H. Versatile scheduling timelines

ClarisImpact timelines work well for planning simple projects and tracking milestones. Grid lines automatically adjust to match your project dates, tasks can be linked to and unlinked from each another, and any task can be designated as a milestone.

I. Easy to use table feature

Create complex tables easily. In addition to organizing text and numbers, tables now work like spreadsheets by supporting industry-standard formulas and summations.

J. More data chart types

We've added 32 new data chart types, simplified the terminology and interface for creating them, and included more ways to customize charts.

K. Enhanced calendars

Produce business or personal calendars that display week numbers as well as weekday-only calendars. New calendar art makes it easier to highlight holidays and other common events.

L. Create great looking graphics

Get creative with a broader palette of colors and gradients. Get your work done faster using the new object Info palette and zooming controls. The

TA43445_About_Version_Macintosh_Read_Me.pdf

ClarisArt libraries contain over 400 new clip art images to increase the variety of high-quality art you can use in your charts and diagrams.

Claris(R) and the ClarisImpact team thank you for your purchase of ClarisImpact 2.0. Your support, comments and suggestions help us to continue to bring you better solutions for your future productivity needs.

Illegal Operation Message in Windows 95

This error message is typically generated when an incompatible printer driver is set as the default.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If you receive an "Illegal Operation" or Exception error 10H message from Windows 95 when performing routine tasks in ClarisWorks 4.0 or 5.0, or FileMaker Pro 3.0 or 4.0, such as installing the application, running an Assistant or opening a file, there are several things that you can do to try to eliminate this error.

If you receive the "Illegal Operation" error click on the DETAILS button. If you get a message similar to the following:

"CLWORKS caused an exception 10H in module CLWORKS.EXE at XXXX:004dc6ef"
"FMPRO caused an exception 10H in module FMPRO.EXE at XXXX:004dc6ef"

(The XXXX seems to vary depending on the operation preformed but the rest of it seems to remain pretty constant.)

You may have an incompatibility between your application and your printer driver.

We have found this particularly to be the case the following printer drivers:

Canon BubbleJet BJC-70 (NOTE: The Windows 95 BJC-70 driver does not cause this error message.)
Canon BubbleJet BJ-210
Canon BJC-610
Canon BJC-4000 Windows 3.1 driver version 1.0d/3.1
Canon BJ-200EX
Canon BJC-4100
Canon BJC-4200
Eclipse Fax driver
Hewlett-Packard (HP) DeskJet 660
Hewlett-Packard (HP) DeskJet 660c driver versions prior to 8.0
Hewlett-Packard (HP) LaserJet 5L
Hewlett-Packard (HP) LaserJet 5P/5MP
Generic/Text Only
MidiComm Fax Driver by MidiSoft
Cheyenne Bit-Fax
Epson Color Stylus

If you are getting this error message, the printer driver you are using should not be set as the default printer when the application. Setting another printer as the default printer and then switching to your specific driver using PRINT SETUP may get you around the problem, but it may crash the system also.

Your best option is to print to another printer or use a compatible printer driver such as the 5P driver or download the updated driver from HP, in the case of the HP LaserJet 5L. For Cannon BubbleJet Printers try the IBM ProPrinter drivers (this does work for the BJ 200EX). Often times compatible drivers will be listed in the printer manual.

Contact your printer manufacturer to see if an updated printer driver is available also.

If changing the printer driver to a compatible driver does not stop the crashing problem, you may try turning off the Math coprocessor. To do this follow these directions:

1. With your right mouse button, click My Computer, and then click Properties.

2. On the Device Manager tab, click View devices by type.

3. Double-click System Devices.

4. Click Numeric Data processor, and then click Properties.

NOTE: With a Plug and Play bios, the Numeric Data Processor option will be under a Plug and Play branch in the Device Manager rather than at the top level.

5. On the Settings tab, click Never Use The Numeric Data Processor.

6. Click OK.

7. Restart your computer.

If you are still having problems, make sure that your temp variable is set correctly. To do this, follow these directions:

1. Click the Start button, point to Programs, and then click MS-DOS Prompt.

2. Type the following and press ENTER:

set

3. Note the directory specified by the TEMP= line.

4. Attempt to access that directory. Type the following at the MS-DOS prompt and press ENTER

cd\\<temp>

where <temp> is the path specified in step 3.

5. If you receive the following error message,

Invalid directory

type the following at the MS-DOS command prompt and press ENTER:

md <temp>

If you do not receive an error message, clear the temp directory of temporary files. Type the following at the MS-DOS and press ENTER:

del *.tmp

6. Type the following at the MS-DOS prompt and press ENTER:

exit

"Device Not Functioning" Error When Installing ClarisWorks 4.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When attempting to install ClarisWorks 4.0 for Windows 95, you may receive the following error message.

"A Device Attached To The System Is Not Functioning Properly"

After acknowledging the error message, the install routine is aborted.

This error can occur if the system is unable to read one of the installation diskettes for whatever reason. Most likely this points to a badly damaged or corrupted diskette. You can verify that the diskette is damaged by trying to copy the contents of the diskette to the hard drive in a blank folder / directory. If any read errors occur during the copying then the diskette is bad and should be replaced.

Connectix Speed Doubler Causing Crashes while Unpacking Messages

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

We have received reports from customers who have tracked down problems they are having with Claris Emailer to a potential incompatibility with Speed Doubler by Connectix. Claris and Connectix have not confirmed this report but are in communication about it. Customers have reported that the problem seems to be specifically related to the Speed Access component of the Speed Doubler product.

Some customers report system crashes when Claris Emailer is unpacking messages it has just downloaded. Another report is system crashes when launching the Claris Emailer application.

Currently, the only workaround is to disable Speed Access. It is recommended that you run Disk First Aid or another hard disk repair tool to check your disk.

If you can confirm this incompatibility, please inform Claris by sending email to emailer-help@claris.com. Include what Macintosh model you have, and the version of the System and Claris Emailer you are using.

Macintosh Portable Data Modem: Using with Dial-Back Systems

I want to use the Macintosh Portable with internal modem to dial into a corporate office network. We have a "dial-back" security system called Defender that requires the modem to answer the "callback" from the corporate network in "originate" mode.

Can this be done?

This article has been archived and is no longer updated by Apple.
The Macintosh Portable Data Modem 2400 doesn't have an option for answering in originate mode, but it can be tricked into doing this. It won't be quite as convenient as setting up a single register, though, and you may want to use a script to automate it, depending on the communications program you are using.

Scenario

Because the goal is to make the modem answer in originate mode, and the modem doesn't have this option, we're going to dial in originate mode, instead and just not dial a number. The trick is to set the modem options to disable Dial Tone detection. If this isn't done, the modem will wait for a dial tone when the other end is sending a carrier.

Follow these steps:

1) Set the modem's active response codes with: ATX3

(Enables OK, RING, NO CARRIER, ERROR, BUSY, and CONNECT messages, but disables dial tone detection which would prevent this from working.)

2) Dial the host and do the necessary steps to generate a callback.

3) Wait for Macintosh Portable modem to generate RING.

4) Immediately force the modem off-hook with: ATD

(The Macintosh Portable modem should wait for carrier and negotiate with the host's modem for a connection.)

5) When the CONNECT message appears, the modems will be talking.

This could easily be put into a communications program script, simplifying the process.

Message Limit with APS Driver

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you can only download a limited number of messages check if you have an APS hard drive. If you have initialized the drive with a driver earlier than the APS 4.0 version, you will have to reinitialize the hard drive with the version 4.0 driver. Just updating as opposed to reinitializing doesn't fix the issue.

Apple‘s Strategy Re: System Application Architecture (SAA)

What Systems Application Architecture (SAA) standard does Apple write to? Can you help?
This article has been archived and is no longer updated by Apple.
Systems Application Architecture (SAA) established a set of common standards and procedures for working with IBM systems and data. These include definitions for Common User Access, Common Communications Support, and Common Programming Interface. The following article from Networking and Communications summarizes how Apple complies with IBM's SAA:

Apple and SAA
Networking and Communications Product Marketing
March, 1990

A key element of Apple's networking strategy is Macintosh integration with IBM systems. The goal is to provide basic connectivity for the Macintosh, and then provide developers and customers with a set of protocols, interfaces, and tools that enable the development of consistent, integrated Macintosh applications for the IBM environments.

Apple will implement the IBM Systems Application Architecture technologies that complement the Macintosh, thereby enabling user transparent access to IBM data and services. Apple's product development will continue to focus on the core networking protocols, interfaces, and services that enable commercial developers and customers to create applications for end users. This helps to produce highly functional software in the shortest possible time by allowing developers to concentrate on the application and user interface, rather than networking.

Apple will continue to enhance the Apple-IBM product line through improvements in functionality, performance, and usability. The commitment is to provide customers with a common Macintosh view of IBM data, services, and applications through support of Macintosh-complementary SAA technologies.

Common Communications Support
Apple now offers a range of networking products that implement key SAA Common Communications Support (CCS) functions. The Apple TokenTalk NB, Serial NB, and Coax/Twinax Cards provide Macintosh connections to IBM SNA networks. MacDFT software provides 3270 terminal emulation with file transfer, as well as copy and paste, between the 3270 screens and Macintosh applications. MacDFT also supports the NetView alert reporting functions of SNA/MS. The Apple 3270 API serves as the 3270/SNA programming interface for MacDFT, Data Access Language (DAL, formerly known as "DAL"), MacWorkStation, and third-party applications. It is also available for the development of customized 3270 applications. MacAPPC implements the LU6.2/NT2.1 protocols, offering the basis for Macintosh integration with emerging cooperative processing applications. These products can be the basis for a wide range of applications, such as Macintosh interfaces to OfficeVision, DB2, and SQL/DS.

With the key connection and communication standards available, SAA application services, such as SNA/DS and DIA, are planned. Apple will also investigate implementations of SNA/MS, DDM, and SNA/FS as those technologies evolve.

Common Programming Interface
The Common Programing Interface (CPI) element of SAA contains two technologies that complement the Macintosh: SQL for the Database interface and CPI-C for Communications.

DAL is Apple's host database access software and programming interface that provides the functionality of the CPI SQL interface. DAL provides consistent access to multiple database environments and multiple operating systems from Macintosh applications. Software developers will use the Apple System 7.0 Database Access Manager (DAM) to link their applications with DAL host servers for MVS or VM, providing access to DB2 and SQL/DS databases. This approach promotes network and database independence for Macintosh applications, and enables users to access data in IBM, Digital VAX, and UNIX environments from a single application.

The DAM also offers developers an interface for implementation-specific SQL dialects to complement DAL. Macintosh applications that access host data through DAL are enhanced by a range of query tools that allow users to perform ad hoc queries in intuitive, graphical ways. These third-party products take the form of Desk Accessories, HyperCard stacks, and applications.

As the customer requirement for LU6.2 products expands, CPI-C (the SAA interface to LU6.2) will be implemented as an enhancement to Apple APPC products.

Three other CPI technologies (Dialog, Query, and Presentation) specify functions that will not be directly supported by Apple because they are targeted at OS/2 and similar functionality is already integral to the Macintosh.

Common User Access
The Common User Access (CUA) element of SAA covers a wide range of guidelines, technologies, and products aimed at improving user interface consistency across IBM platforms. Apple does not plan to support the diverse elements of CUA since the Macintosh provides the best and the most consistent user interface to IBM systems as well as to multivendor environments.

Many organizations employ Digital VAX systems and UNIX platforms in addition to IBM. With the Macintosh, a "common user interface" that is integral to the Macintosh architecture for local and LAN-based applications is also supported on the VAX. In UNIX environments, Apple's A/UX 2.0 implementation of System V UNIX runs Macintosh applications and standard UNIX applications with full communications support based on industry standards, such as TCP/IP and NFS.

Unlike many vendors, whose personal computer, mainframe, and workstation user interfaces vary, Macintosh can provide a single-user interface, a mature application base, and rich data interchange capability across all of these systems. This advantage will be applied to SAA resources.

Common Applications

The goal of Common Applications (CA) is to deliver functionality that spans several IBM platforms with a consistent user interface and portability. In addition to the advantages in a multivendor environment, Macintosh participates in Common Applications through support of SAA communications protocols and programming interfaces. Combined with the rich networking and toolbox facilities in the Macintosh environment, these SAA functions provide Macintosh users with a "common view" of the IBM host environments.

Summary

Apple is committed to serving its customers by providing IBM SAA-compliant products that are integrated into the Macintosh environment. Apple has delivered the most critical networking and communications products for Macintosh interoperability in SAA environments and will continue to enhance our IBM networking and communications product line through support of accepted SAA standards that complement the Macintosh in an IBM environment.

Reported Conflict with Quick Help

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

There has been a reported conflict with the Help System in ClarisWorks 4.0 for Macintosh when run with the Fax Manager v1.1 extension. Fax Manager v1.1 is supplied as part of the Mac Comm Centre 1.1 software. This extension causes the Help System to not function in ClarisWorks 4.

Published Date: Feb 18, 2012

Label Sizes for Laser, Dot Matrix and Inkjet Printers

The new Avery 8000 label line is the same measurement as the 5000 line.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Recent versions of FileMaker Pro, ClarisWorks and Claris Organizer have built-in label templates for the most popular sizes of Avery labels. The templates are identified by the Avery model number. The 4000 series are labels for dot matrix printers. The 5000 series are for Laser printers.

Avery now produces a line of labels just for inkjet printers. These labels are the 8000 series. Each 8000 series label is the same size as its 5000 series equivalent. For example, the 8162 label is the same size as the 5162. Therefore, to create a label layout for an inkjet printer, use the 5000 series equivalent layout.

How to Speech-Enable Your Documents

Using the Text To Speech features of your Macintosh computer to speak your text in ClarisWorks 3.0 and 4.0 documents

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

If you want your Macintosh to speak a ClarisWorks document, you can make this happen provided you have ClarisWorks 3.x or 4.x and PlainTalk application program with Speech Manager.

Plain Talk is a System Extension. If it is not installed, copy two files and one folder from the Text-to-Speech folder in the Apple Extras folder (on your hard drive or Apple Macintosh CD) to your System/Extensions folder. Those 3 items are: MacInTalk Pro, Speech Manager, and Voices Folder. After copying these items, restart your computer.

To verify that PlainTalk is installed, make sure that the Speech Manager extension is in your Extensions folder (in your System folder).

In ClarisWorks, you need to install a shortcut to speak your documents. To do this follow the next instructions:

1. Launch ClarisWorks.

2. Select Shortcuts... Edit Shortcuts from the File menu. A dialog box will appear, and under Available Shortcuts, scroll down to the bottom and click on the red lips icon. You can tell that you have chosen the correct icon, because the Speak Text description will appear in the dialog box.

3. Click on the Add button and the Speak Text Shortcut will be added to the list of installed shortcuts.

To use Speak Text, open a document, click and drag to select the text you want to hear and click on the lips button in the shortcuts palette. If the palette is not showing up, then choose Shortcuts... Show Shortcuts from the file menu.

Volume
The speaking may not be very loud using the built-in speaker. To turn it up, go to Control Panels and Sound. Change from Alert Sounds to Volumes and turn up the Built-In Volume.

Troubleshooting
If you are in a Word Processing document and the lips do not show up in your Shortcuts Palette, and you have added them, then PlainTalk/Speech Manager is not installed.

Notes: ClarisWorks will only speak word processing and drawing Documents. The lips icon will not show up in other ClarisWorks modules. ClarisWorks 2 and earlier did not have text-to-speech capabilities.

Rotating Mail Merge Fields Redraw Incorrectly

Undocumented Feature: Rotating Mail Merge Fields In ClarisWorks 4.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

With ClarisWorks 4.0 you can insert and rotate a merged field within a mail merge document. However, this is an extremely unstable feature. You will have unusual redraw problems after you rotate the field, and under certain circumstances you may even experience system freezes.

Published Date: Feb 18, 2012

About ClarisDraw Version 1.0 Windows, Read Me

Here's essential information you'll need for ClarisDraw 1.0 for Windows.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

WELCOME TO CLARISDRAW 1.0!

This Read Me file contains technical notes and tips that may prove helpful when you use ClarisDraw 1.0, as well as the latest news about great features of ClarisDraw.

I. TECHNICAL NOTES AND TIPS

A. Installation Follow the instructions in the installation guide to install ClarisDraw. You can't copy the files to your hard drive using the DOS copy command, because the files are compressed to fit on fewer disks. The setup program decompresses files during installation.

You must be running SMARTDRV.EXE to install ClarisDraw. Claris recommends using the default values for SmartDrive.

ClarisDraw is a 32-bit application. Before installing ClarisDraw on a computer running Windows 3.1 or Windows for Workgroups 3.11, you must install Win32s, which is included in this package.

Note: If you are using Windows 95, do not install Win32s.

Some virus checking software may interfere with the installer or slow down the installation process. Turn off any virus checking software before starting the ClarisDraw Installer. You can turn virus checking back on after your installation is successful.

You cannot start ClarisDraw from a directory whose name contains upper ASCII characters (for example E, (c), #). This is a limitation of Win32.

B. In-box Support Materials

Installation Guide User's Handbook Context-sensitive Help system 2,400 piece SmartSymbol clip art library

C. System Requirements and Compatibility IBM and compatible personal computers, 386 or higher processor, and a recommended 8Mb of RAM. Hard disk with 15Mb (to install all clip art libraries) available and Windows 3.1 or higher. Printers supported: Hewlett Packard LaserJet, PaintJet, DeskJet series. Postscript printers such as Apple LaserWriter, IBM Laser Printers, and a wide variety of other Windows compatible printers.

D. Out-of-memory error messages If you encounter an error message that indicates there is not enough memory to perform an operation, Claris recommends:

--adjusting your Virtual Memory setting (see Performance tips for Windows 3.1 and Windows for Workgroups 3.11 below)

--removing any unnecessary drivers and TSRs from the CONFIG.SYS file to free up more memory in DOS

--closing other applications and ClarisDraw documents that are running in the background

E. Performance tips for Windows 3.1 and Windows for Workgroups 3.11 32-bit applications such as ClarisDraw 1.0 require that Virtual Memory is on. To improve performance on computers with 8 MB of memory or less, Claris recommends setting virtual memory to permanent and using the suggested size for your virtual-memory setting as displayed in the Virtual Memory dialog box. This value is typically twice the size of physical memory, but should be at least 11,700 K or 11.7 MB.

If the suggested size of virtual memory is less than twice the physical memory installed on your computer, you might need to increase your free disk space by removing unwanted files or defragmenting your hard disk.

Note: DOS 6.0 users can use DEFRAG.EXE.

To set virtual memory:
1. In the Program Manager, open the Main Group, double-click the Control Panel icon, and then double-click the 386 Enhanced icon.
2. Click Virtual Memory and then click the Change.
3. Select Permanent from the Type pop-up menu.
4. Click the checkbox next to Use 32-Bit Disk Access. Note: This setting is NOT recommended for laptops running on battery power.

5. Click OK.

If you are an experienced Windows user and you have adjusted your virtual memory settings as described, but still want to improve your system's performance:

-- In DOS, run: DEFRAG MEMMAKER

-- Change the following settings in the CONFIG.SYS file: FILES=60 STACKS=9,256

-- Add the following line to the CONFIG.SYS file: BUFFERS=10

-- Add the following line to the [WINDOWS] section of the WIN.INI file: DefaultQueueSize=16

-- Add the following lines to the [386enh] section of the SYSTEM.INI file: DMABuffersize=64 XLatBufferSize=128 MaxBPS=768

-- Delete the following lines from the [386enh] section of the SYSTEM.INI file: EGA80W0A.FON... EGA40W0A.FON... CGA80W0A.FON... CGA40W0A.FON...

-- Always use SmartDrive!

F. Using ClarisDraw with Windows 95 You cannot launch ClarisDraw 1.0 using the Network Neighborhood feature of Windows 95. Use a different method to launch ClarisDraw instead (for example, use Explorer).

G. Printing If you have trouble printing, try installing an updated printer driver, available from your printer manufacturer or Microsoft Corporation. For instructions on installing a driver and configuring your printer, see the the Control Panel information in the Microsoft documentation. ClarisDraw requires a valid default printer driver, NOT the Generic/Text Only driver.

To select or change the default printer:

1.In the Program Manager, open the Main Group, double-click the Control Panel icon, and then double-click the Printers icon.
2.Select a printer from the Installed Printers list and click Set As Default Printer. If no printers appear in the list, see your Microsoft documentation for instructions on installing printers.

Printing with Hewlett-Packard printers in PCL mode: Under some conditions, the default settings for printers using PCL mode will not print rotated text correctly. To change the default settings:

1. In the Program Manager, open the Main Group, double-click the Control Panel icon, and then double-click the Printers icon.
2. Select the printer under "Installed Printers", then click Setup.
3. In the Setup dialog box, click the Options button. Change the Graphics Mode option to "Raster", then click OK for each dialog box. Click Close for the setup box, and exit Control Panel. (Note: for Windows 95 users, please see your Win95 documentation for changing printer properties).

H. Video cards and drivers If your screen doesn't display objects correctly, you may have a issue with your video driver. Try changing the resolution to 640x480 or 800x600 or try changing the number of colors displayed (for example, 256, 32K, or millions of colors).

To verify a video driver issue, change the video driver to Windows standard VGA and run ClarisDraw. If the issue disappears, contact the video card manufacturer for the latest version of the video card driver or use the driver that is included with the Windows installation.

I. ClarisDraw INI file settings If you experience either of the issues listed below, make the suggested changes to the [ClarisDraw] section of the CLARIS.INI file in your Windows directory:

-- Issue: Color/gradient palettes do not draw completely, or show up with black or missing colors/gradients Suggested setting: Cache Palettes = 0

-- Issue: Tools are not drawn correctly, or display as black Suggested setting: BitmapTools=0

J. Fonts If fonts do not display or scale correctly (for example, if they are clipped or overlap), Claris recommends that you:

-- Make certain a valid printer driver is selected as the default and that it is NOT the Generic/Text Only driver

-- Enable TrueType fonts (see below)

-- Make certain the standard Windows fonts, such as Arial, are properly installed

To delete or reinstall standard Windows fonts, see the Microsoft documentation.

To enable True Type fonts:

1. In the Program Manager, open the Main Group, double-click the Control Panel icon, and then double-click the Fonts icon.
2. Click TrueType, and then click Enable TrueType Fonts.

K. Sharing ClarisDraw files between the Macintosh and Windows ClarisDraw 1.0 for Windows has the same file format, user interface, and features as ClarisDraw 1.0 for the Macintosh. You can create a ClarisDraw document in Windows and edit it on an Apple Mac OS computer, or vice versa. Therefore, if you work with both Macintosh and Windows versions of ClarisDraw, or if you collaborate with colleagues who use ClarisDraw 1.0 for Macintosh, you can work without translating files.

To open a ClarisDraw 1.0 Windows file using ClarisDraw 1.0 for the Macintosh:

1. Hold down the Option key and choose Open from the File menu.
2. Choose ClarisDraw in the Show section of the Open dialog box.
3. Double-click on the name of the file you want to convert.

To open a ClarisDraw 1.0 Macintosh file using ClarisDraw 1.0 for Windows:

1. If you are using Windows 3.1 or Windows for Workgroups 3.11, make sure the filenames of the Macintosh ClarisDraw files you want to convert follow DOS filename conventions (8 characters or less) and end with the .CDD extension. (For ClarisDraw Library files, use the .CLB extension.)
2. Open the files in ClarisDraw 1.0 for Windows.

If you want to transfer ClarisDraw files between platforms via 3.5-inch disks, you must use a file transfer program that lets you create and use PC-formatted 3.5-inch disks on a Macintosh. To copy the ClarisDraw files onto a PC-formatted disk, follow the directions in the documentation for the file transfer program you are using. When you use a multi-platform server (such as Novell Netware) to transfer files from a Macintosh to a Windows computer, you can use the ClarisDraw documents right off the server. No file transfer program is required.

Fonts, margins, page breaks, and some graphics might display differently when a file is transferred between Macintosh and Windows. You might have to adjust the margins and page breaks in the transferred file to restore the original appearance.

You can minimize font issues by installing and using the TrueType fonts that ship with Windows. When you open a file, ClarisDraw first checks to see if each of the fonts in the document is installed in the current system. If a font is not installed, ClarisDraw checks its font mapping information to substitute an appropriate font. Font mapping information is stored in the Claris Font Map file inside the Claris folder in your System folder on Macintosh and in the [ClarisFontMap] section of the CLARIS.INI file in your Windows directory on the PC. If a font is not listed in the font mapping file, it is mapped to Helvetica on the Macintosh and to Arial on the PC.

L. Network installation issues ClarisDraw can be installed and run simultaneously by multiple users off of a server. See the "ClarisDraw for Windows Installation Guide" for information on how to set up ClarisDraw on a server.

Multiple simultaneous users can share ClarisDraw palettes. However, if simultaneous users edit the same palette, only changes from the last save are retained. For this reason, Claris recommends that users who access ClarisDraw from a server and who want to customize palettes should store their PALETTES directory on their own hard disks.

Multiple users cannot simultaneously open the same ClarisDraw document or library.

M. Converting MacDraw Pro files to ClarisDraw 1.0 for Windows format

If you have ClarisDraw 1.0 for the Macintosh, use the procedure below to convert MacDraw Pro files.

[*Editor's Note:* The original ClarisDraw 1.0 for Windows Read Me document did not include the revised information contained in the "If you don't have ClarisDraw..." paragraph immediately below.]

If you don't have ClarisDraw 1.0 for the Macintosh, you must acquire the Convert2DOS application. For more information on how to acquire and use the Convert2DOS application, see the following Tech Info Library article:

Article 58253: "**Convert2DOS Read Me**"

To convert a MacDraw Pro file:

1. Open the MacDraw Pro file in ClarisDraw 1.0 for the Macintosh.
2. Save the file as a ClarisDraw file with a name that follows DOS file naming conventions (8 characters or less) and ends with the .CDD extension (for example, PARIS.CDD).
3. Open the file in ClarisDraw 1.0 for Windows.

N. Paint mode color palettes In Paint mode, the color palettes each display the default 256-color ClarisDraw palette rather than a palette customized according to the colors in a paint frame.

II. GREAT FEATURES OF CLARISDRAW 1.0

A. Cross-Platform Support ClarisDraw 1.0 is now available for Windows and Windows 95 as well as the Macintosh and Power Macintosh. You can easily exchange files between platforms, because no file translation is required.

B. Great Looking Graphics Get creative with a broader palette of colors and gradients. Get your work done faster using the object info palette and zooming controls. The ClarisArt libraries contain over 400 new clip art images to increase the variety of high-quality art you can use in your charts and graphics.

C. Breakthrough Graphic Intelligence SmartSymbol Libraries dramatically speed up the creation of graphics with drag and drop ease, and you can add your own frequently used graphics to a custom library. Editing is easier as you can search and replace objects dragged from libraries, just as with text.

Claris and the ClarisDraw team thank you for your purchase of ClarisDraw 1.0. Your support, comments, and suggestions help us to continue to bring you better solutions for your future productivity needs.

Line Spacing Indicator Not Updating Correctly

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you double click on the line spacing indicator under the ruler bar in ClarisWorks 4.0 for Macintosh, you will be presented with the Paragraph dialog box. You can change the line spacing from lines to points or another unit, and change the unit value for the line spacing. If you change the unit measurement without also changing unit value, the line spacing indicator in the ruler bar doesn't reflect this change, even after clicking OK or Apply. To get the change to be reflected by the line spacing indicator press the Tab key, click the Align pop-up menu in the Paragraph dialog box or actually change one of the unit values in the line spacing boxes before clicking OK or Apply.

PowerBook 2300c Update 1.0, Read Me

This system extension ensures that the trackpad works correctly on localized PowerBook 2300c systems. It goes in the Extensions folder, inside the System Folder. It is available in the WorldWide Software Updates in the following languages: Catalan; Croation; Czech; German, Danish, Spanish, French Universal, Norwegian, Japanese, Finnish, Dutch, Swedish and Italian.

This article has been archived and is no longer updated by Apple.
Important Information About the Update for Your Macintosh PowerBook 2300c Computer

This document adds to and updates the information in the manuals that came with your computer and the general PowerBook 2300 Read Me file on your computer's hard disk. It is a good idea to read this document now, and keep it for future reference.

If your PowerBook is connected to a printer, choose Print from the File menu to print a copy of this document. When you are finished reading and printing, choose Quit from the File menu to quit the SimpleText application program.

PowerBook 2300c Update

To ensure that the trackpad on your PowerBook operates correctly, the PowerBook 2300c Update file must be in the Extensions folder, which is inside the System Folder on your computer's hard disk. The update file and a copy of this document are located in PowerBook Extras folder, inside the Apple Extras folder.

On some computers (possibly including yours), the update file was put in the Extensions folder at the factory. You can check the contents of the Extensions folder to see if the PowerBook 2300c Update is in that folder. If the update file is not in the Extensions folder, use the instructions below to put it in the folder.

Putting the PowerBook 2300c Update file in the Extensions folder

To put the update file in the Extensions folder, follow these steps:

1. Open the Apple Extras folder on your computer's hard disk.

2. Open the PowerBook Extras folder and locate the PowerBook 2300c Update file.

3. While holding down the Option key, drag the update file to the icon of the System Folder (not to the System Folder window, if that window is open).

4. When you see a message reporting that the file belongs in the Extensions folder, click OK. If you see a second message asking if you want to replace a file with the same name, click OK.

The update file will be copied to the Extensions folder.

Important: If you reinstall the system software, you must put the update in the Extensions folder after installation is complete. Be sure to leave a copy of the update file and the update Read Me document in the PowerBook Extras folder so that you can reinstall the update file if necessary.

About Version 1.0, Product Fact Sheet

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Macintosh version shipping, with a Windows version to follow in the first half of 1995.

Product Description
ClarisImpact software creates an entirely new category of productivity software for business and general users: Business Graphics Processing. Until ClarisImpact, users had to purchase, then master, a hodge podge of spreadsheet, charting, drawing and presentation applications to create, edit and communicate business graphics. Creating graphics with spreadsheets or underpowered charting programs is cumbersome and editing is limited. If the user is already in a report or slide and a change must be made to the graphic, they have to go back into the application where the graphic was created and edit the data. Cutting and pasting between programs not only decouples the graphic from the data source, but resolution is lost as well. Drawing applications used to edit these basic graphics suffer from growing complexity. Word processing and presentation tools don't support the range of chart types or depth of graphics tools a business user needs.

ClarisImpact unifies the create-edit-communicate process prevalent in today's business computing environments into one simple application. ClarisImpact automatically creates the graphics a user wants, allows for instant editing, and provides a completely integrated solution for communicating the graphics in text-based reports or slide presentations. Claris has leveraged its leadership in user interface design and cross-platform technology to bring business computing with graphics to a new level.

Key Features and Benefits

* Automatic graphics Models; create organizational charts, flow charts, timelines, network diagrams, data charts, graphs and calendars, with proper sizing and connectors.

* Intelligent editing; ClarisImpact automatically updates the graphic when changes are specified. Moving any connected object will result in the rejoining of connections. Dragging and dropping elements into any Model results in instant reordering, aligning and spacing. Style changes and edits are simply a matter of browsing an extensive list of pre-defined and custom styles, and applying a favorite with one click.

* Integrated word processing; create reports and memos with business graphics. No need to cut and paste graphics into a separate word processor. Automatic text-wrap around all graphics, footnotes, page numbers, font, style options, formatting and spell checking are included. Import support for MacWrite Pro, MS Word, WordPerfect and other formats included.

* Integrated presentations; create slide presentations with professionally designed backgrounds and special effects, all included in ClarisImpact. Use any of the business graphics in the same document, on the same page. Multi-media capabilities (Apple QuickTime video and sound), automatic slide builds, and transition effects within or between slides, auto-play and simple slide reorganization are included. Output choices allow the user to easily create overhead transparencies, on-screen presentations, handouts or slides.

* Professionally designed chart styles and artwork; 3,000 piece clip art library allows for easy, customized, flexible editing. Users can select from dozens of pre-defined styles and style "families" for both flexibility and consistency.

* Mix multiple graphics with text in the same report or presentation; graphics are always live -- the user can create or edit graphics directly in the report or slide.

* Claris Graphics Engine (CGE); provides seamless cross-platform (Macintosh and Windows) transparency with data and files between Claris graphics products, such as ClarisImpact for Mac and ClarisDraw for Windows, high performance and intelligence.

* Drawing tools built-in; create or customize graphics with the polygon, bezier, ellipse, line and rectangle tools. Fill color, gradient, pen and line style options included.

* File exchange capabilities; the XTND architecture is built in to ClarisImpact, and allows users to easily open, work with and save documents in a variety of industry standard file formats such as PICT, PICT2, MacDraw(R)Pro, MacDraw II, EPSF and other graphics and text file formats.

ClarisImpact Target Users

Business professionals, from administrative and clerical support to management-level professionals in corporations and government, higher education and small office/home office will benefit from productivity gains made by using ClarisImpact. Business users will be able to instantly access the Models and built-in intelligence in ClarisImpact to create and edit many different types of business graphics for reports and presentations.

Corporations and government agencies of all sizes and types will benefit from the features, cross-platform capabilities, flexibility, and especially productivity gains made from ClarisImpact. No big training investment, and no need to use multiple applications to create stunning reports and

presentations.

In-box Support Materials

* Getting Started Guide
* User's Guide
* Sample files and pre-defined artwork and styles
* Context-sensitive Help system

Support Services

* Customer Relations; for registration and other non-technical information, phone lines are open from 8 a.m. - 5 p.m. PST, Monday through Thursday, 8 a.m. - 2 p.m. Friday. Phone: (800) 544-8554

* Technical Support; a dedicated team of technical support specialists are available to answer technical questions and solve issues. Phone lines staffed from 6 a.m. - 6 p.m. PST Monday through Thursday, 6 a.m. - 2 p.m. Friday. Phone: (408) 727-9054.

System Requirements, Compatibility

* Apple Macintosh Plus, Centris, Classic, LC, SE, Performa, PowerBook, II, Quadra families.

* Native version available for the PowerMacintosh family.

* Hard disk drive and 2MB of memory required for System 6.0.7 or later; 4MB for System 7.x

* Printers supported; Apple LaserWriter, Personal LaserWriter, ImageWriter and StyleWriter. Hewlett-Packard LaserJet, DeskWriter and PaintWriter families and 100% compatibles.

* Graphics file formats supported; EPSF, TIFF, PICT or PICT2, CGM, MacDraw II, MacDraw Pro, MacPaint, QuickTime Movie.

Growstub Error

Avoiding application and growstub errors

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If you're getting an "Application Error", "Growstub caused a General Protection Error (GPF) in module Pointer.dll" with the options to [CLOSE] or [IGNORE], you should select close. This will isolate the incident, close the application and let you proceed in Windows. This error generally occurs under the following circumstances:

--Using Windows 3.11
--Running Microsoft Mouse Driver v9.01
--Launching Claris Impact 2.x

The error occurs as a result of going into the "Mouse Manager" software and exiting or canceling out and not restarting Windows. To avoid this error, after using Mouse Manager, just restart Windows.

Numbers in Calculation Fields Change When Opened with Power Macintosh ClarisWorks (DB)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Numbers in calculation fields may change under the following conditions:

1. Create a database using the 68K version of ClarisWorks 3.0 with a calculation that has a number in the formula
2. Open this database using ClarisWorks 3.0 PowerMac.
3. Save, close, and reopen the file.
4. Go to Define Fields and look at the calculation formula.

You'll notice that the numbers in the formula have changed. For example, the formula:
'Amount Sold' * 0.0825
might be changed to something like
'Amount Sold' * 1.9875985

The workaround is to put the numbers in the formula in quotes. For example:
'Amount Sold' * "0.0825"

This issue is fixed in ClarisWorks 4.0.

About ClarisWorks Version 4.0v4 Updater, Read Me

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

WELCOME TO CLARISWORKS 4.0v4!

Thank you for choosing the ClarisWorks(R) 4.0 application. We're pleased to provide the ClarisWorks 4.0v4 Update, which has additional important features and addresses a few known issues with v1. Once you've installed the update, it will provide better Macintosh Drag and Drop support, backward file conversion, and more.

This document provides information about:

I. Installing the ClarisWorks 4.0v4 updates
II. Problems and issues addressed in v4
III. New features in ClarisWorks 4.0v4

I. INSTALLING THE CLARISWORKS 4.0V4 UPDATES

To update the ClarisWorks 4.0 (v1, v2, or v3) product currently installed on your computer:
1. Put the "ClarisWorks 4.0v4 Update Disk 1" disk in your floppy drive.
2. Double-click the ClarisWorks Update Installer icon.
3. Choose Easy Install (to install all of the new v4 components except the ClarisWorks File Converter) or Custom Install (if you want to specify which components to install), and then click Install.

Once installation is complete, the process of updating your existing ClarisWorks 4.0 (v1, v2, or v3) application itself will begin.
4. Select the copy of the ClarisWorks 4.0 application to update and then click Update.

The installation process finishes and the application is updated.

Note: To install the ClarisWorks File Converter application, you must choose it from the Custom Install list. For more on using the ClarisWorks File Converter, see the document "Read Me - ClarisWorks File Converter".

II. PROBLEMS AND ISSUES ADDRESSED IN V4

This v4 Updater addresses several issues from version 4.0v1:
* Mail Merge and Multiple Line Data. In v4, when a mail merge field contains multiple lines of text, the text now merges and prints correctly. (The text still displays as a single line on the screen.)
* Mail Merge and Sliding over Empty Fields. In v4, when there is an empty mail merge field on a line by itself, the following text moves up appropriately and prints correctly. (The text does not "slide" on the screen.)
* Rotating Library Images. In v1, some of the ReadyArt(TM) library images didn't rotate correctly. This was fixed in v4.
* Stationery Corrections. Minor changes were made to some of the stationery files.
* Address List Assistant. Minor changes were made to the Address List Assistant for better printing and on-screen display.
* New AppleWorks DB/SS and RTF filters.
* Faster Word Count
* Option left/right arrows in WP now correctly skips carriage returns and tabs (as it did in versions prior to 4.0).
* New Document dialog now displays more quickly, especially when there are many stationery files in the ClarisWorks Stationery folder.
* Word Services AppleEvent Support. In v4, it is easier to use applications that support the Word Services AppleEvent standard (such as some third party spelling or grammar checkers).

To enable the Word Services command in the Edit:Writing Tools menu of the ClarisWorks word processor:
1. Select Preferences from the Edit menu.
2. Select the Text icon.
3. Check the Word Services checkbox under General and click OK.

To select a Word Services application for use with ClarisWorks:
1. Open or create a word processing document.
2. Select Writing Tools from the Edit menu and then select Edit Word Services.

You see a dialog containing a list of all the Word Services applications for which ClarisWorks is currently configured.
3. Press the Add button.

You see a dialog listing the applications running on your Macintosh that use Word Services AppleEvent standard.
4. Select the one you want and click OK.
5. In the Word Services dialog, click OK.

A new menu item corresponding to the Word Services application you chose appears in the Writing Tools menu.

You can also use the Edit Word Services dialog to remove installed Word Services applications from the Writing Tools menu.

To use a Word Services application on a ClarisWorks word processing document, choose the appropriate menu item from the Writing Tools menu. This launches the Word Services application if is not already running. If you have text selected in the document, then the Word Services application checks the selection. Otherwise, the entire document is checked.

III. NEW FEATURES IN CLARISWORKS 4.0V4

In addition to resolving some known problems in v1, the v4 revision also adds new features, including:

* New picture and layout in the ClarisWorks splash screen.
* Macintosh Drag and Drop Support. In v4, users can use Macintosh Drag and Drop (that comes with System 7.5) to move text, graphic objects, and spreadsheet cells within ClarisWorks 4.0 documents, drag selections from one document to another, drag selections to other applications (including creating clipping files in the Finder).
* Backwards File Conversion to 2.0, 2.1, and 3.0 formats. You can use the new ClarisWorks File Converter application to save version 4.0 files in the format used by ClarisWorks versions 2.0, 2.1 and 3.0. For more on the File Converter, see the file "Read Me - ClarisWorks File Converter".
* New filter for WordPerfect 3.1 for Macintosh.

Claris(R) and the ClarisWorks team thank you for your purchase of ClarisWorks 4.0. Your support, comments, and suggestions help us to continue to bring you better solutions for your future productivity needs.

Merge Data Field Limit for ClarisWorks 4.0v4

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The technical specification for database in ClarisWorks 4.0v4 allows for the maximum number of characters in a merge field to be 255.

Characters over 255 will be dropped, but sliding works correctly.
Published Date: Feb 18, 2012

Converting MacDraw Pro or MacDraw II files to Claris Impact for Windows or ClarisDraw for Windows

MacDraw Pro files can be converted to ClarisDraw for Windows or ClarisImpact for Windows format using the Claris utility, Convert2DOS. MacDraw II files can also be converted using other methods.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
CONVERTING MACDRAW PRO FILES:

The MacDraw Pro utility, Convert2DOS, is a Macintosh application which changes MacDraw Pro files into Windows format by splitting them into a data file (with an 8 character name plus the .MDP extension) and a resource file (with the identical name except for a .RES extension.). Your original MacDraw Pro files are not altered; Convert2DOS reads these files and creates new files which then can be converted.

Convert2DOS works with files from all versions of MacDraw Pro, but does not work with MacDraw II files. To convert MacDraw II files, save them within MacDraw II as Color PICT2. If you no longer have MacDraw II, import the files into an application which can open these files on the Macintosh, then save them as PICT. Once saved on a PC formatted disk on the Mac, these files can then be opened by ClarisDraw or ClarisImpact for Windows.

The converter is available in the Software Libraries of all of our online services under the Miscellaneous Mac category. Because the file is a Macintosh self-extracting archive, it should be downloaded directly to a Macintosh. Downloading the file to a Windows machine can cause issues when trying to extract it on a Macintosh.

NOTE: The application, Convert2DOS, does not run on the Windows platform. It must be run on a Macintosh.

Convert2DOS is most useful if you do not have ClarisDraw or ClarisImpact for Macintosh. If you have ClarisDraw or ClarisImpact for Macintosh, you do not need to use Convert2DOS. You can open your MacDraw Pro files in ClarisDraw or ClarisImpact for Macintosh, then save them with the proper extension (.CID for Claris Impact and . CDD for ClarisDraw). Your ClarisDraw or ClarisImpact for Macintosh files can then be copied to a DOS-formatted disk and read directly by ClarisDraw or ClarisImpact for Windows.

System Requirements:
* a Mac, Power Mac or equivalent with a 68030 processor or better
* a high-density floppy drive
* System 7.x
* PC Exchange or Apple File Exchange
* 50 K of free disk space plus space for the converted files
* 2.5 MB of RAM for the application (more for optimum performance)

Download Sites:
<http://www.claris.com/software/graphics/Convert2DOS.sea.hqx>
<ftp://ftp.claris.com/pub/USA-Macintosh/x.misc/Convert2DOS.sea.hqx>

America Online: keyword Claris - Software Libraries
CompuServe: Go Claris

CONVERTING MACDRAW II FILES:

Convert2DOS works with files from all versions of MacDraw Pro, but does not work with MacDraw II files. To convert MacDraw II files, save them within MacDraw II as Color PICT2. If you no longer have MacDraw II, import the files into an application which can open these files on the Macintosh (such as ClarisWorks) , then save them as PICT. Once saved to a PC formatted disk on the Mac, these files can then be opened by ClarisDraw or ClarisImpact for Windows.

Font Size or Type is Not Correctly Reflected in ClarisWorks 4.0 Document (WP)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This issue occurs in all versions of ClarisWorks 4.0, v1-v4 Mac and Windows.

If you select text attributes (for example, font or size) while text is not selected, then choose a ruler setting (for example, line spacing), then type, the typed text does not have the selected font attributes.

1- Open a new word processing document
2- Select a font and size (e.g., Avant Garde 18 pt.)
3- Select a ruler setting (e.g., line spacing or center alignment)
4- Type a word. You'll see that the font and size are not remembered.

If you apply the ruler settings first (step 3), then the font and size, all the settings are remembered and it works correctly.

Superscript and Subscript Keyboard Shortcuts Do Not Respond Correctly (DB)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Issue: In a database, using the keyboard commands for superscript and
subscript do not work. The only workaround is to use the menus to manually select those styles.

Steps to recreate the issue:

1- Create a database with a text field
2- Place insertion point into the text field
3- Try using the keyboard commands for superscript and subscript
(command-shift + and command-shift -)

The superscript keyboard command works if you use the + key on the numeric
keypad, but not on the standard keypad. The - key does not work in either
location.

The ClarisWorks development team is aware of the issue.

ClickBook and the HP DeskJet 850c

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClickBook does not work with the HP Deskjet 850c printer if you have background printing turned off and you have the ClickBook Setup control panel to "ClickBook active from Page Setup"

If you click the "Use ClickBook" check box in page setup and then print, ClickBook will not take over the printing. The solution is to turn background printing on or set the ClickBook setup control panel to "ClickBook Always Active".

Error message : "Sorry the ASCII translator is not responding properly"

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This error message is returned when importing a text file into a ClarisWorks word processing document if a Claris XTND system file 1.3 is found by ClarisWorks in the System folder as well as in the Claris folder .

To correct the issue, remove the Claris XTND file from the System folder.

Trial Version Documentation: Using Claris Emailer

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Using Claris Emailer

This file covers most of the day-to-day tasks for which you'll use Claris Emailer--creating, sending, receiving, and filing mail messages. It also provides information about using the Claris Emailer Address Book and scheduling account connections. You send and receive messages during a connection to an online service, such as AOL or CompuServe. You can set up a connection to communicate with one service or many services.

Connecting to a service

You can connect to a service immediately or at your next scheduled connection. For more information on scheduling a connection, see "Scheduling account connections" later in this document.

Important You must turn on your computer and modem, and launch Claris Emailer, for a connection to work. If you schedule a connection for a time when you'll be away from the computer, be sure to leave your computer and modem on, and leave Claris Emailer running.

To connect to a service immediately, choose Connect Now from the Mail menu. You see the Connect Now Setup dialog box.

* To retrieve incoming messages during the connection, select Get.
* To send messages during the connection, select Send and choose an option from the pop-up menu. Then, choose Specified Msg to send an open message, or choose All Pending Msgs to send all the unsent messages in your Out Box.
* To initiate the connection, click Connect.

Creating messages

To create a message from the Out Box, choose Out Box from the Window menu and then click Add. To create a message at any time, choose New from the Mail menu. You see a new blank message.

Tip To create a message that's already addressed to your intended recipients, choose Address Book from the Window menu, select one or more addresses, and then choose New from the Mail menu.

Addressing messages

After you create a message, you can address it by typing addresses manually, using the Find Address dialog box, or using Macintosh drag and drop.

When you finish addressing a message, you see a clock icon next to the recipient's name, meaning that the message will be sent at the next scheduled Send connection. If you see the triangular alert icon, your address is incomplete. If this happens, read this section carefully to make sure you entered all the required addressing information.

Addressing a message manually

To address a message manually, you type information in the address area of the message. To add another recipient, click Add Recipient. To delete a recipient, click anywhere in the recipient line and then click Delete Recipient.

* To enter the recipient name, type a name in the Recipient field. As you begin typing the recipient's first name, Claris Emailer fills in the rest of the name for you by searching within the address book. Keep typing until Claris Emailer fills in the correct name.

If the recipient is in the Address Book, press Tab to have Claris Emailer automatically enter the rest of the addressing information. If the Address Book has two or more recipients with the same name, or if the recipient is a group, you see the Find Address dialog box (see the next section). If you inadvertently enter the wrong recipient, you can type over the recipient's name and addressing information, or delete the recipient and add a new one.

* To enter the recipient address, type the recipient's mail address in the Address field.
* To enter the destination, choose the name of the service that the recipient uses to retrieve mail from the pop-up menu. For example, choose America Online if the recipient receives mail in an America Online account. Note that when you choose a destination, you only enter the account name in the Address field, and not the entire email address.

If you want, you can type the name of the destination instead. As you type, Claris Emailer fills in the rest of the destination for you. Keep typing until Claris Emailer fills in the correct destination.

If the recipient is in the Address Book, the destinations they have addresses for are in bold in the Destination pop-up menu. If you choose one of these destinations, Claris Emailer updates the Address field with the correct address.

* To choose a service to send the mail, choose the name of the service you want to use to send the message from the pop-up menu under Send Mail Via. For example, choose CompuServe if you want to use your CompuServe account to send this message.

If you want, you can type the name of the destination instead. As you type, Claris Emailer fills in the rest of the service name for you. Keep typing until Claris Emailer fills in the correct service.

Using the Find Address dialog box

To find recipient addresses and add them to an outgoing mail message:

1. Create an outgoing message.

See "Creating messages," earlier in this document.

2. Click Find Recipient.

You see the Find Address dialog box.
3. If you want to narrow down the number of recipients in the Find Address dialog box, type a few letters in the Filter text box.
You can type lowercase or uppercase letters. Claris Emailer finds all the recipients that contain the specified letters in the Name and Description fields. For example, typing ja finds "Japan University" and "Jane Smith."

Note You cannot enter part of a first name and a last name to create a match. For example, entering sal will doesn't find "Sally Willford."

4. Select one or more recipients.
* To select a recipient, click anywhere on the recipient's row.
* To select more than one recipient, Shift-click the recipients you want to select. To deselect a recipient, or to select noncontiguous recipients, Command-click the recipients.
* To select a different destination for a recipient that subscribes to more than one mail service, click the triangle next to the recipient's name to display other destinations for a recipient. Then select the row containing the destination you want.
5. Click Select.
If the selected address is a group, all the recipients in the group are added to the recipient list.

Addressing messages using Macintosh drag and drop
You can address a message by dragging the recipients' addresses to the message. The recipients' addresses can be from the Address Book or from text clippings on the desktop.

You can drag addresses or text clippings to either the address area of the message or to the address area icon, which looks like a face. If you drop the addresses on the address area, you see a border around the address area.

Including carbon copy and blind carbon copy recipients
There are three types of recipients in a message. You can change a recipient's type at any time by choosing an option from the Type pop-up menu in the address area.
* Choose To when the recipient is the primary recipient. It's best to include at least one To recipient in a message. You aren't required to include To recipients. All recipients can tell who the To recipients are.
* Choose CC (Carbon Copy) when the recipient is not the primary recipient, but the recipient may be interested or involved in the content of the message. All recipients can tell who the Carbon Copy recipients are.
* Choose BCC (Blind Carbon Copy) when the recipient is not the primary recipient, but the recipient may be interested or involved in the content of the message. No recipient can tell whether there are any Blind Carbon Copy recipients. A Blind Carbon Copy recipient cannot tell whether there are other Blind Carbon Copy recipients.

Enclosing files
You can enclose any type of file in an outgoing message using the Find Enclosure button, the Open dialog box, or the Macintosh drag-and-drop feature.

You enclose files by adding them to the Enclosure area of an outgoing message. To see the Enclosure area, click the paperclip icon.

Before you send an enclosure, consider the following:
* To enclose an entire folder, you must enclose each file within the folder separately, or use an application, such as StuffIt, to convert the folder to a single file.
* Be sure to enclose the original file and not an alias to the file.
* Check with both the sending and receiving services before sending enclosures over the Internet. (Some services do not support sending and receiving enclosed files over the Internet.)
* Check with the recipient to make sure that they have the applications necessary to open the files you're sending. If you save your files in text (ASCII) format, they can be opened in most applications that accept text.
* If you're enclosing a text file of less than a few pages, you may want to include the text in the message body instead of sending it as an enclosure.

Using the Find Enclosure button
Follow these steps to add an enclosure using the Find Enclosure button. If you are not already in the Enclosure area, click the paperclip icon.
1. Click Find Enclosure in the Enclosure area of a message.
2. In the Find Files dialog box, choose the name of the disk you want to search from the Volume pop-up menu.
3. Type the name (or partial name) of the file you want to search for.
4. Click Search.
5. Select the file(s) you want to enclose.
6. Click OK.

Using the Open dialog box to add an enclosure
Follow these steps to add an enclosure using the Open dialog box. If you are not already in the Enclosure area, click the paperclip icon.
1. Click Add Enclosure in the Enclosure area of a message.
2. Select a file from the Open dialog box.
3. Click Select.

Dragging an enclosure to a message

Follow these steps to add an enclosure using the Macintosh drag-and-drop feature. If you are not already in the Enclosure area, click the paperclip icon.

1. Arrange the windows so that you can see the desktop and the Enclosure area of the message.
2. From the desktop, select the files you want to enclose.
3. Drag the files from the desktop to the scrolling list in the Enclosure area.

As you drag the files into the message, you see a border around the Enclosure area. When you release the mouse, the enclosures are added to the message.

Tip You can also drag enclosures to the paperclip icon of a message.

Setting options for sending enclosures

To set the way Claris Emailer handles the sending of enclosures, select options from the Enclosure area of a message.

* To compress the files you're sending, select Compress Files.

You must compress files if you include more than one enclosure. Compressing enclosed files saves time during the transfer and can reduce the charges on some services. Claris Emailer uses the StuffIt compression technology to compress the files. The recipient of the message must have a StuffIt expansion tool (available from the public domain) to expand any compressed files. If the message is received using Claris Emailer, enclosures are automatically expanded.

* To set the encoding of compressed files, choose an option from the Encoding pop-up menu.

Enclosed files are sent using special encoding to ensure that they arrive without errors. If the recipient's destination is the same as the service you're sending the message through, choose Service Default, the optimal encoding for your service. If your service doesn't support enclosures, try choosing BinHex, which appends the enclosure as text in the message body.

Removing enclosures

To remove enclosures, select one or more enclosures in the Enclosure area of a message and click Delete Enclosure.

Sending messages

After you create a message, you can:

* save it and send it at the next connection to a service
* save it without sending it
* send it immediately. (When you send a message immediately, it is automatically saved for you.)

You can also reply to or forward a message you receive.

Outgoing messages are saved in the Out Box. To open a message in the Out Box, double-click it.

Sending a message at the next connection

To save a message and send it at the next connection to a service, click Save. Claris Emailer saves your message, closes it, and stores it in the Out Box. To save your message without closing it, choose Save from the File menu. For information on setting up scheduled connections, see "Scheduling account connections," later in this document.

Saving a message without sending it

If you're not finished composing a message, you can save it without sending it, and continue working on it later. To do this, select Do not schedule, and then click Save. Claris Emailer saves your message, closes it, and stores it in the Out Box. To save your message without closing it, choose Save from the File menu.

Sending messages immediately

After you create a message, you can send it immediately. You can also immediately send all the unsent messages in your Out Box.

* To save a message and send it immediately, click the Send Now button at the top of the message screen. (The Send Now button is dimmed if you try to send a message while a connection is open.)
* To immediately send all the unsent messages in your Out Box, choose Connect Now from the Mail menu.

Note You must close a message before you can send it. Clicking Send Now automatically closes a message before sending it.

After either of these actions, you see the Connect Now Setup dialog box. For information on setting connection options, see "Connecting to a service," earlier in this document.

Checking the status of messages you send

After you save or send a message, you can check its status in the Out Box. To go to the Out Box, choose Out Box from the Window menu.

The icons in the first three columns show the status or give information about a message.

* The clock icon shows that the message will be sent at the next scheduled connection.
* A crossed-out clock icon shows that the message has been saved but will not be sent because the Do not schedule option was selected in the message. If you want, you can edit the message and save it again and/or send it.
* A checkmark shows that the message has been sent successfully.

* The triangular alert icon shows that the message has an addressing error. This icon is also shown in the Out Box tab.
* The paperclip icon shows that the message contains one or more enclosures.
* The left arrow icon shows that the message is a reply to a message you received.

Receiving messages

This section covers reading, replying to, and forwarding messages you receive, and storing and opening enclosed files.

You can immediately retrieve incoming messages from one or more online services, or wait until messages are retrieved automatically at the next scheduled connection. To retrieve messages immediately, follow the instructions on connecting to a service, earlier in this document.

Messages you receive are stored in the In Box. When you receive a message, you see:
* a flashing Claris Emailer icon at the far right of the menu bar (when Claris Emailer is hidden), and
* an arrow in the In Box tab in the Browser.

A checkmark shows that you read the message.

A paperclip icon shows that the message contains one or more enclosures.

A left arrow icon shows that you replied to the message.

Reading messages

To read a message, choose In Box from the Window menu, select the message you want to read, and click View (or double-click the message). You see the message window for the current message.

Opening and moving enclosed files

If a message has an enclosure, you see the Enclosures list the first time you open the message. You can also show the Enclosures list at any time by choosing Toggle Mailer from the Edit menu or clicking the triangle above the message area. You can open an enclosure from Claris Emailer, or move it to a convenient location on your hard drive and open it there. You move an enclosure on the desktop, or by dragging it from the Enclosures list using Macintosh drag and drop.

Important You cannot open enclosures in a filed message. To open an enclosure, move the message back to the In Box or Out Box. See the next section, and "Moving messages using Macintosh drag and drop," later in this document.

Opening an enclosure in Claris Emailer

To open an enclosure, double-click it in the Enclosures list. Claris Emailer launches the application used to create the enclosure.

Important Claris Emailer cannot open an enclosure by itself. To open an enclosure, you must have the application used to create that enclosure.

Moving an enclosure on the desktop

Enclosures are automatically saved in the Downloads folder in the Claris Emailer folder. You can drag an enclosure from the Downloads folder to another location on the desktop.

Tip To change the default folder where downloaded enclosures are saved, choose Preferences from the Setup menu, click the General tab, click Set, and then select a folder.

Moving an enclosure using Macintosh drag and drop

Follow this procedure to drag a message from the Enclosures list to a folder or disk on the desktop.
1. Open the Enclosures list for an incoming message.
2. On the desktop, set up the windows so that you can see both the Enclosures list and the folder or disk into which you want to move the enclosure.
3. Select one or more enclosures in the Enclosures list.
Shift-click the enclosures you want to select. To deselect an enclosure, or to select noncontiguous enclosures, Command-click the enclosures.
4. Drag the enclosures to the desired folder or disk on the desktop.

Replying to a message

To reply to a message:
1. From the In Box, open the message you want to reply to.
2. Click Reply or choose Reply from the Mail menu.
If there is more than one recipient, select an addressing option in the Reply To dialog box, and click Reply.

Tip While you're still in the message, press Option as you click Reply to bypass the Reply To dialog box.

In your reply, you can add and remove recipients as you do for a message you create. For information, see "Addressing messages," earlier in this document.

Including text from the original message
You may want to include part of the original message in your reply, especially if:
* there is a long delay between the original message and the reply
* you want your reply to be seen in the context of the original message
* one or more recipients did not receive the original message

Claris Emailer has a quoting feature you can use to mark the text of an original message in a reply. Every line of a quote is preceded by a quoting character (>).

Use one of the following methods to add a quote to a reply:
* To use text from an original message in a reply, open the original message, select the text that you want to include in the reply, and then create the reply. For information on creating a reply, see the previous section.
* To copy text from a message (or any other type of document) and then paste it into another message, open a message or other document containing text, and copy the text you want to quote. Then position the insertion point in the reply and choose Paste as Quotation from the Edit menu.
* To copy the entire body of a message, including details about the sender and subject, open a message, and then choose Copy Entire Message from the Edit menu. You can then paste the text into a reply, or any other document that accepts text.

Forwarding a message
A message you forward contains the complete original message. You can edit the text of the forwarded message just as you would a new message.

To forward a message, open the message you want to forward and click Forward or choose Forward from the Mail menu. To address the message, see "Addressing messages," earlier in this document.

Filing messages
You can file incoming and outgoing messages in folders in the Filing Cabinet. Filing messages helps you to organize your In Box and Out Box.

To file a message, select it in the In Box or Out Box, and then click File. Or, if you hold the mouse down over the File button, you see a pop-up menu. Choose a folder from the menu to save the selected message in that folder. (Claris Emailer is preset to save the message in the folder shown in bold in the pop-up menu.)

In the Filing Cabinet, you can view and open filed messages. To open the Filing Cabinet, choose Filing Cabinet from the Window menu.

Working with filed messages
You can select and delete messages, find text in a message, and move messages back to the In Box or Out Box or to a different folder in the Folder Name list.
* To select a message, click anywhere on the message. Shift-click to select more than one message. To deselect a message or to select noncontiguous messages, Command-click the messages.
* To delete selected messages, click Delete File(s).
* To find text in a message, click Find. In the dialog box, type the text you want to search for, select where you want to search, and click OK.
* To move selected messages to the In Box or Out Box, hold the mouse down over the Move File(s) button, and choose In/Out Box from the pop-up menu.
* To move selected messages to another folder in the Folder Name list, click Move File(s). In the dialog box, select the folder you want to move the messages to, and click OK.

Moving messages using Macintosh drag and drop
You can drag messages from the Filing Cabinet to:
* the In Box or Out Box (by dropping them on the In Box or Out Box tab)
* another folder in the Folder Name list
* a folder or disk on the desktop

Note You cannot drag incoming messages to the Out Box or outgoing messages to the In Box.

Setting up folders in the Filing Cabinet
You can add and delete folders, and delete all the messages in a folder.
* To add a folder to the Folder Name list, click Add Folder and then type a name for the folder. You can add as many folders as you want to the Filing Cabinet. When you name a folder, use a meaningful name, such as "Project Status Messages."
* To delete all the messages in a folder, select the folder and click Empty Folder. You can empty only the Read Mail, Sent Mail, and Deleted Mail folders.
* To delete a folder, select the folder and click Delete Folder. You can delete only folders you've added to the Filing Cabinet.
The folders in the Filing Cabinet are stored on the desktop. Any folders you add to the Filing Cabinet go in the Personal Folders.

Tip If you file a message in a folder, or drag it to the desktop, you can open the message by double-clicking it.

Using the Address Book

Use the Address Book to store addresses. You can add addresses to the Address Book and set up group addresses. You can also import and export addresses to and from other applications and text files. When you're finished adding addresses, you can find an address quickly by typing text in the Filter text box.

After you add addresses to the Address Book, you can use them to address outgoing messages.

Adding addresses

You add addresses to the Address Book by either typing them manually or by adding the sender or recipient addresses from messages you receive. You can also exchange addresses with other people by saving them as text clippings.

Adding addresses manually

To add an address manually to the Address Book:
1. Choose Address Book from the Window menu.
2. Click New User.
3. Enter a name and description for the recipient.
4. For Destination, choose a destination from the pop-up list or type the name of the service that the recipient uses to retrieve mail.
For example, choose America Online from the pop-up menu if the recipient receives mail in an America Online account.
If you want, you can type the destination instead. As you type, Claris Emailer fills in the rest of the destination for you. Keep typing until Claris Emailer fills in the correct destination.
If the destination does not appear in the pop-up menu, choose Internet and add the recipient's full Internet address.
5. Enter the mail address in the Address field.
6. If the recipient has more than one mail address, click the Add icon to add another address line, and then repeat steps 4 and 5.
Continue adding lines until you've added all of the recipient's addresses.
Note To delete one of the recipient's addresses, click anywhere in the address line and click the trash icon.
7. Click in the left-most column next to the address that you want to be the preferred address.
The preferred destination icon appears. Claris Emailer uses the preferred address when addressing a message.
8. Click Save.

Creating groups

You can consolidate several recipient addresses into a group. When you send a message to a group, every recipient in the group receives the message.

Note Addresses you add to a group are not linked to individual addresses in your Address Book. If you edit individual addresses, they do not change the addresses in any group. To edit addresses in a group, you must select the group, click Edit, and make the changes there.

To create a group:
1. Choose Address Book from the Window menu.
2. Click New Group.
3. In the Address Book Group Entry dialog box, enter a group name and description.
4. Follow the instructions in the next section for adding addresses to a group.
5. Click Save.

Adding addresses to a group

You can add addresses to a group by typing them manually, or by dragging them to the Address Book Group Entry dialog box using Macintosh drag and drop. You can drag addresses from the Address Book, or from the desktop.

Importing addresses

If you have addresses in one of the following mail programs, you can import them directly into Claris Emailer.

Mail program/Address book filename/Location
* America Online/Address Book/Online Tools folder in AOL folder
* CompuServe Information Manager/CompuServe Addresses/CompuServe folder in System Preferences folder
* Eudora/Eudora Nicknames/Eudora Folder in System Folder
* Navigator/CompuServe Addresses/Navigator folder

To import addresses from another mail program:
1. Choose Import Addresses from the File menu.
2. Find the file you want to import.
3. Click Open.

Scheduling account connections

This section provides step-by-step instructions scheduling connections to services.

You can automate when Claris Emailer sends and receives your mail by creating schedules. Schedules help you efficiently manage your computer

and automate connections to online services. For example, you could create one schedule to check your mail often during the week and another to check only once a day on the weekends.

Important You must have your computer and modem on and the Claris Emailer application running for schedules to run. Schedules do not launch Claris Emailer.

Creating or changing a schedule

You can create several schedules to send and receive your mail. Schedules can help you control connections to different services at various times during the day. For example, you can retrieve your mail from one service once a day, but send mail to another service once an hour.

Claris Emailer staggers the connection times within the ten-minute intervals you can choose for a schedule. This random interval relieves peak congestion at online services, helping you avoid connection errors.

Note You might want to consider the monthly costs of connecting to your services when you create a schedule. For example, if you create a schedule to connect once every 30 minutes to a service, you'll connect 1,440 times per month. At one minute per connection, you would accumulate 24 hours of connect time.

To create or change a schedule:

1. Choose Schedules from the Setup menu.
You see the Schedules List window.
2. Click Add to create a schedule. To change an existing schedule, double-click the name of the schedule.
You see the Schedule Entry dialog box.
3. Type the new or changed name of the schedule.
It's a good idea to name the schedule so that it is easily recognizable. For example, you might name a schedule that retrieves mail from America Online, AOL Mail.
4. Select the tasks to perform during the connection. You can select Get Mail or Send Mail, or both.

Note If you want to get your mail at one time and send it at another, you'll need to create a schedule for each task.

5. Select the account(s) that you want to make a scheduled connection to. You see a checkmark next to each selected account.
You can connect to several accounts with one schedule. To disable an account without removing it from the schedule, deselect it.

Important Changing how you connect to an account does not change a schedule; the schedule still runs, but using the connection information selected in the Service Entry dialog box. Likewise, if you select a different location in the Locations List window, be sure that the schedules you create for an account are still valid for the new location.

6. Choose either a timed or repeating connection from the Schedule Type pop-up menu.
* If you choose a timed connection, select the days, hours, and times that you want the schedule to run. You must select at least one day, hour, and time to activate the schedule.
* If you choose a repeating connection, choose how often the schedule will run from the Frequency pop-up menu.

Note The scheduling options in the Schedule Entry dialog box change when you select either a timed or repeating connection from the Schedule Type pop-up menu.

7. Click Save.

Waiting for Connection Gray Out in Canadian French and French Versions of ClarisWorks

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Apple Modem Tool 1.1F and 1.5F shipping with ClarisWorks 2.x, 3.0 and 4.0 Macintosh has a problem that prevents ClarisWorks 2.0 through 4.0 to use the wait for connection command.

These communication tools are currently shipping with ClarisWorks 2.0, 3.0 and 4.0 Canadian French and French applications.

The immediate workaround will be to either use an Apple modem tool 1.02F or a US Apple Modem Tool 1.5 or above. Apple is aware of that and should provide an update version of the French Apple modem tool.

White Objects Print Black to HP 4 and 4 Plus

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When using Windows 95, printing white graphic objects or data chart elements to a Hewlett-Packard 4 or 4 Plus printer can result in the objects printing out black.

To correct this problem, change the printer driver graphics mode from "Use vector graphics" to "Use raster graphics."

To do this:

1. Choose Print Setup from the File menu
2. Confirm that the currently selected printer is the one you wish to print to and click on the Properties button
3. Click on the Graphics tab and select the radio button next to "Use raster graphics"
4. Click OK, when the previous screen reappears, click OK again
5. Choose Print from the File menu and print as usual

The problem has been observed on the 4 and 4 Plus, but may also occur on other printer models. This solution has only been tested on the 4 and 4 Plus, however.

Arrows Are Reversed When Resizing

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Under some circumstances, arrows will be reversed if they are resized. This is a problem in ClarisDraw 1.0 and ClarisImpact 2.0.

This problem occurs if you draw lines with either Arrow at Start or Arrows at End chosen, then select and resize them. The arrows on these lines will be reversed after resizing.

ClarisWorks: How to Set Up a Layout for Envelope Printing

Some guidelines to follow when setting up a layout to print envelopes from ClarisWorks (DB).

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

Note: AppleWorks is the new name for ClarisWorks.
This article has been archived and is no longer updated by Apple.
To print multiple envelopes from a ClarisWorks database you should set up an envelope layout. To do this, follow these step-by-step instructions:

1. Determine whether your printer feeds envelopes top-first or sideways. Your printer manual is the best source of this information, but if the manual is not available, markings on the printer itself may indicate the direction. Look carefully near all openings and on paper trays for a small envelope icon and note its orientation.

2. If your printer feeds envelopes sideways (most laser printers do), determine whether your printer feeds envelopes by edge-feed or center-feed. Again, see the printer manual or markings on the printer for this information.

3. Create a new blank layout: go to the Layout menu and choose Layout. Next, Choose New Layout from the Layout menu. Give it a name like "Envelope" and choose Blank for the type. Click OK.

4. Choose Print Setup (Windows)/ Page Setup (Mac OS) from the File menu. Choose the envelope size you want if that option is available, otherwise use the US Letter paper size. If your printer feeds envelopes sideways, choose Landscape (sideways or horizontal orientation). Click OK.

5. In your layout, drag the Body line down so that the Body section covers about three quarters of the page.

6. Place the fields on the layout by choosing Insert Field from the Layout menu. Choose Insert Field for each field you want and repeat this step until you have inserted all necessary fields for the envelope. You can then delete the field descriptions (the bold text to the left of each field box).

7. Next, move the fields to where you want them to print on the envelope, resizing them (click to select, then drag a corner dot) if necessary. It may be helpful to Show Rulers (under the Window menu in ClarisWorks 5.0/ View menu in other versions).

If you are printing a standard business-size envelope:

- For edge-feed and top-feed envelopes the upper-left corner of the layout is the upper left corner of the envelope; the return address would thus go in the top left, and the recipient's address would typically start about 2 inches from the top and 4 inches from the left side.
- For center-feed envelopes, the return address should be placed about 2-1/4 inches from the top, and the recipient's address would be at about 4 inches from the top and 4 inches from the left.

Note: These measurements are approximate; it may take some experimentation and testing to get your desired result.

8. Choose Browse from the Layout menu and print one test envelope to see if it prints in the correct place. If it does not look right, return to Layout mode, move the fields on the layout in the direction you want them, and test-print again.

Additional tips for printing envelopes:

- Use Slide Objects to eliminate blank spaces in fields. Refer to the ClarisWorks On-Line Help for further information on Sliding Objects.
- If you need to print many envelopes, check your printer manual to see if you can place multiple envelopes in a paper tray. Some printers only allow envelopes to be printed singly by hand-feeding them.

TA43481_DOS_Text_File_Format_(TIL00568).pdf

DOS 3.3: Text File Format

DOS sequential text files are saved as strings of ASCII characters, just as if they were printed. Furthermore, numeric variables are stored as a string of characters rather than in their internal binary format.
This article has been archived and is no longer updated by Apple.
The number of characters required by a given variable VAR can be found with:

```
PRINT LEN (STR$ (VAR))
```

The carriage return, along with other separating characters sent out after the data, also need space allocated for them.

Introduction

To create documents that can be viewed by a World Wide Web (WWW) browser, you use the Hypertext Markup Language (HTML). HTML consists of a set of *tags* (formatting codes) added to text. For example, if the text "Local News" is formatted as an 18 point header, the text looks like this: <H2>Local News</H2> when translated to HTML. Text can also be tagged to create a hypertext links to other documents. You can use ClarisWorks to open, edit, and create HTML documents without having to be familiar with HTML tags.

This document describes how to:
· open (import) HTML documents so you can read and edit them as word processing documents
· create word processing documents and save (export) them in the HTML format
As you get started, please keep the following points in mind:
· You should be familiar with the concepts and techniques for working with ClarisWorks word processing documents, stylesheets, and shortcut buttons. For more information on these topics, see the documentation that came with ClarisWorks.
· Each WWW browser interprets HTML tags in slightly different ways. For example, some browsers may display a header in color in an elegant typeface, while a text-only browser may display the same header in capital letters in the same size and font as the rest of the document. The ClarisWorks HTML translator uses the default display styles for Mosaic, a browser created by the National Center for Supercomputing Applications (NCSA). For more information on NCSA Mosaic, visit the WWW site at:
http://www.ncsa.uiuc.edu/SDG/Software/Mosaic (note 1)
· The translator file is called "WWW [HTML]" and is installed, along with other translators, in the Claris Translators folder in the Claris folder (inside the System Folder). You don't use the HTML translator file directly. Instead, you use the ClarisWorks save and open commands to direct the file through the translator.
Note: Updates to this document are available on ClarisWeb at: http://www.claris.com/pubs/clarisworks/html-primer.html (note 2)

Creating HTML documents

This section describes how to create new HTML documents. For information on entering and formatting text in HTML documents, see the section "Formatting and editing HTML documents."

Using stationery to create HTML documents

The easiest way to create HTML documents is to start with the ClarisWorks HTML stationery, a template included with ClarisWorks 4.0. The stationery is a blank preformatted word processing document that you can reuse.

To open the stationery document:
1. Launch ClarisWorks by double-clicking the ClarisWorks icon.
2. Choose New from the File menu.
3. In the New Document dialog box, select Use Assistant or Stationery.
4. Choose Internet from the pop-up menu, select WWW [HTML] Document, and then click OK.
You see the blank, untitled stationery in its own window. The original document remains unchanged, ready for you to use again. The stationery

includes a set of HTML styles in the stylesheet palette and three shortcut buttons, "Make Hypertext Link", "Unordered List Item", and "Horizontal Rule."
5. To open the stylesheet palette, choose Show Styles from the View menu.
The styles include headers of various sizes as well as styles for normal, literal, and preformatted text.
6. To display the shortcuts palette, choose Shortcuts and then Show Shortcuts from the File menu.
For specific information about using the shortcut buttons to create HTML documents, see the sections "Hypertext links", "Lists", and "Horizontal rules."
Note: To make the buttons appear in the shortcuts palette for any ClarisWorks word processing document or text frame (not just in a stationery document):
1. Launch ClarisWorks and open the HTML stationery by following Steps 1-4, above.
2. Choose Shortcuts and then Edit Macros from the File menu.
3. Select Make Hypertext Link from the Macro pop-up menu and then deselect
Document Specific. Do the same for Unordered List Item and Horizontal Rule.
4. Click Done.
The HTML stationery shortcuts now appear in the shortcuts palette for any word processing document.

Creating HTML documents without using stationery

If you prefer, you can create an HTML document in a regular word processing document instead of the HTML stationery.

To open a word processing document:
1. Launch ClarisWorks by double-clicking the ClarisWorks icon.
2. Choose New from the File menu.
3. In the New Document dialog box, select Word Processing and then click OK.
Using the ClarisWorks HTML stylesheet or HTML shortcut buttons is optional. If you want to use the ClarisWorks HTML stylesheet, go on to the next step. If you want to use the HTML shortcut buttons, follow the steps in the Note in the previous section "Using stationery to create HTML documents."
4. To import the HTML stylesheet into your blank document, choose Show Styles from the View menu.
5. In the File menu on the stylesheet palette, choose Import Styles.
6. Navigate to the ClarisWorks Styles folder in the ClarisWorks 4.0 Folder, select HTML Styles, and then click Open.
7. In the Select Styles to Import dialog box, click Check All and then click OK.

Saving documents as HTML files

To save (export) a document as an HTML file:
1. Choose Save As from the File menu.
2. In the Save As pop-up menu, select WWW [HTML].
3. Navigate to the folder in which you want to save the file, type a file name, and click Save.

To help you keep track of the file format of your documents, you can add extensions to the filenames, such as myfile.html for an HTML file, or myfile.cw for a ClarisWorks file. For best results with HTML files, don't use spaces in the filenames. Either remove spaces or replace them with underscores or hyphens.
Important: Be sure to keep copies of your documents in their original formats, especially HTML documents that you import. The translator does not provide a complete set of HTML tags and may replace some of the original tags.

Opening HTML files

To open (import) existing HTML files:
1. Launch ClarisWorks by double-clicking the ClarisWorks icon.
2. Choose Open from the File menu and then navigate to the HTML file you want to open.
3. In the Document Type pop-up menu, select Word Processing. In the File Type pop-up menu, select WWW [HTML]. (If you'd like see what the HTML codes in your text look like, select All Available or Text in the File Type pop-up menu.)
4. Select the name of the file you want to open, and click Open.
The HTML document opens. You see it as it might look when viewed by an HTML browser. If you want to use the optional ClarisWorks HTML stationery features, continue to the next step.
5. Import the the HTML stylesheet into your document by following Steps 4-7 in the section "Creating HTML documents without using stationery."
Note: Imported text is styled as "Body+" in the stylesheet. However, the translator tags the text correctly when you export it, even when styled as "Body+," and you can use the stylesheet to style any new text that you type.
6. Set up your document with the HTML shortcut buttons by following the steps in the Note in the section "Using stationery to create HTML documents."

Formatting and editing HTML documents

This section describes how to use ClarisWorks text and paragraph attributes to format or edit documents that can be translated to HTML format.

Getting started

You start with a ClarisWorks word processing document. To create an HTML document, follow the directions in the section "Creating HTML

documents." To open (import) an HTML file that you want to edit, follow the directions in the section "Opening HTML files".

It's easier to apply the various text styles if you can see the carriage returns and spaces in your document. To show these characters - called *invisibles* or *formatting characters* - use the keyboard shortcut Command-; (semicolon). To hide the formatting characters, press Command-; again. (The Command key is the cloverleaf key on the bottom row of the keyboard.)

If you're using the ClarisWorks stationery, or if you've set up a word processing document so you can use the HTML stationery features, show the stylesheet (choose Show Styles from the View menu) and the shortcuts (choose Shortcuts and then Show Shortcuts from the File menu). Important: Apply only those ClarisWorks styles that start with "HTML" (for example, HTML Normal Text). With few exceptions, (noted in the applicable sections) the HTML translator and browsers don't recognize any other ClarisWorks styles.

Paragraphs

Type your text and end the line or paragraph by pressing Return (or place the insertion point in the text, choose Paragraph from the Format menu, and then type 1 in the space after box). The default paragraph style for the stationery is HTML Normal Text. The translator tags text styled as HTML Normal Text as a paragraph. Most browsers separate paragraphs by adding white space after the paragraph.
Note: The translator interprets soft returns (Shift-Return) as spaces.

If you don't want extra white space after a block of text, place the insertion point in the text, choose Paragraph from the Format menu, and then type 0 in the space after box. The translator will tag the carriage return as a break. Browsers don't usually add white space after a break.

Tabs

Tabs are usually translated into white space, except when the tabs appear in lists or preformatted text (see the sections "Lists" and "Preformatted text").

Character formatting

To make characters bold, italic, or underline, select the text and choose Bold, Italic, or Underline from the Style menu at the top of the screen. If you choose any other item from the Style menu (for example, Shadow or Inferior), the translator interprets it as plain text.
Note: The translator interprets most bold text as a header. Headers appear on a separate line when viewed from a browser. If you don't want the translator to interpret bold text as a header, make the font size of bold text 11, 12, or 13 points.

Headers

Use headers to structure and organize the HTML document, just as you use headers to structure and organize any text document. To create a header, type the text, select it, and then choose a header style-such as HTML Header (9 pt.)-from the stylesheet (or choose Bold from the Style menu and any size except 11, 12, or 13 points from the Size menu). When the translator interprets text styled as a header, it adds white space above and below the text.

Unsupported characters

The translator ignores or interprets as spaces characters such as soft returns (Shift-Return), page numbers, page breaks, and date characters inserted by using the Insert Date command.

Hypertext links

A hypertext link is a string of clickable text (called an *anchor*). When you click on the link in a browser, you "jump" to another document.

To make a hypertext link:
1. Select the text that you want to be seen as the link anchor.
2. Click the Make Hypertext Link shortcut button (or style the text so it looks different from the surrounding text and then insert a footnote by choosing Insert Footnote from the Format menu).
* Make hypertext link shortcut button
Clicking the button changes the selected text to blue underline and inserts a footnote mark. You see footnote text instructing you to fill in the Uniform Resource Locator (URL) of the document you are linking to.
Note: If you insert a footnote but don't change the anchor's appearance (for example, to blue underline), the translator uses the text preceding the footnote (up to 255 characters) as the link anchor. Note also that HTML doesn't support footnotes, so you can't use footnotes except to create hypertext links.
3. Replace the footnote text "INSERT URL HERE" with the URL of the destination document.
URLs represent file locations on the World Wide Web. A URL has the general form

scheme: //host.domain [:port] /path /filename

For more information on HTML and URLs, visit the WWW site at http://www.ncsa.uiuc.edu/demoweb/html-primer.html (note 3)

Lists

Use lists to group related items. List items always start with a tab (or a .5 inch indentation). You can show the relative importance of each item in a list by using multiple tabs (or multiple .5 inch indentations) to indent items-as you would in an outline. Items in *ordered lists* are numbered and items in *unordered lists* are set off with a bullet. You can include both ordered items and unordered items in the same list.

To create a list:
1. Press Tab to indent the line one or more times (or choose Paragraph and type a multiple of .5 inches in the Left Indent box).
Each tab character, regardless of tab size (or each .5 indentation, as typed in the Left Indent box), adds an additional level of indention.
2. Type the character that defines the type of list item (ordered or unordered).
To create this type of list item - Do this
Ordered (numbered) - Type a number followed immediately by a period, right parenthesis, or a hyphen-for example, 1., 1), or 1-. Browsers vary in how they format the numbers on ordered list items.
Unordered (bulleted) - Insert a bullet by clicking the Unordered List Item shortcut button (or type the bullet by pressing Option-8). Most browsers display a bullet at the beginning of each item in an unordered list.
3. Type the text for the item. The text can extend to more than one line.
4. Repeat Steps 1-3 for each item in the list.
5. End the list by doing one of the following:
· Start the next line of text at one less tab than the last item of the list.
· Press Return to insert a blank line after the last list item, and begin the next text segment with a non-list character (that is, no bullets or numbers).
Important: Don't use styles from the stylesheet (such as Bullet or Diamond) to create lists in your HTML document-the HTML translator and browsers don't recognize ClarisWorks styles as list types.

Example 1 Each additional list level is called an *embedded* list.

1. The "1." is the beginning of the initial list.
2. This is the second item of the initial list.
1. Here we are at two list levels, thus we begin a new list.
2. This is the second item of the embedded list.
3. Here we end the embedded list, and continue the initial list.

The embedded list could have been a bulleted list. The type of list (ordered or unordered) is determined by the first list item in that list level.

Example 2 This ordered (numbered) list contains an unordered (bulleted) list:

1) The "1)" is the beginning of the initial ordered list.
2) Second item of the initial list
· First item of the unordered embedded list.
· Second item of the unordered embedded list.
3) Third item of the initial list.

Example 3 This list shows that the first character of a new list determines if the list is ordered or unordered. When viewed by a browser, the list in this example is ordered exactly the same as the list in Example 2.

1- The "1-" is the beginning of the initial ordered list..
· Second item of initial list (the bullet will appear as "2." in the HTML document)
· First item of the unordered, embedded list.
2- Second item of the embedded list. The number "2-" will be a bullet.
3- Third item of the initial list.

Pictures

You can include pictures (images) in your HTML document. The translator supports anchored pictures, but not floating ones. To make sure your pictures are anchored, select the picture and choose Cut from the Edit menu. Then click in the text where you want the picture to go and choose Paste from the Edit menu. Correctly anchored pictures have one handle when you select them. (Floating pictures have four handles when selected.)

The translator automatically saves the pictures as individual files and creates tags in the HTML file that refer to the picture files. The references are to the same relative directory as the HTML file, so if you move the HTML document to another location, you must also move the picture files.

The pictures are saved as PICTs, but to be able to view the pictures in the document on a WWW browser, you must convert them to Graphic Interchange Format (GIF). The translator adds the *.gif* extension to the picture filenames in the HTML source file, but you still must to convert the file from PICT to GIF format. When you've finished, check to be sure that the filename for each picture has the ".gif" extension in lower case.
Note: Shareware conversion applications such as GifConverter and GraphicConverter are widely available from on-line services and popular Macintosh FTP archives on the Internet.

Horizontal rules

Horizontal rules are useful for separating sections of text. To insert a horizontal rule, click in the text and then click the Horizontal Rule shortcut button (or press Return, type a series of underscore characters, and then press Return again).
You see a series of underscores at the insertion point in the document.

Preformatted text

If you want a section of text to look exactly as you type it, select the text and then click HTML Preformatted Text in the stylesheet palette in the HTML stationery (or choose Monaco from the Font menu). Preformatted text appears in both your document and the browser in a monospaced font:

```
This is an example of what
preformatted text looks like.
```

Although tabs are supported in preformatted text, you should use spaces instead of tabs, because tab sizes can vary in different browsers.

Literal text

There are many features in HTML that the translator doesn't support. If you want to add advanced or unsupported HTML commands to your document, select the text and then click HTML Literal Text in the stylesheet palette in the HTML stationery (or choose Text Color from the Style menu and select a shade of red).

Technical details

This section describes some of the details of the HTML tags used by the translator.

Character formatting HTML has two kinds of text styles, *logical* and *physical*. Logical styles are interpreted differently by different browsers. For example, the logical style (that is, "emphasis") may be represented as red single underline by one browser and italics by another. Other examples of logical text styles are and <cite>. Physical styles, such as italic, underline, and 11, 12, or 13 point bold, are represented as typed. When you format text as italic, underline, or 11, 12, or 13 point bold, the ClarisWorks HTML translator tags these physical ch aracter styles with logical character styles, like this:

These types of characters	Are assigned this HTML tag
Italics	<cite>
Underline	
Bold (11, 12, or 13 point only)	

Note: If bold text is any size except 11, 12, or 13 points, the translator tags it as a header. See "Headers," below.

International characters The translator supports most of the ISO Latin 1 character set standard on both export and import.

Special characters Some characters (< > & ; and /) are used in HTML tags. If you type the characters <, >, &, ; or /, the translator interprets them as typed. If you want the characters to be interpreted as part of HTML tags, style the tags as literal text. See the section "Literal text."

Paragraphs and carriage returns The translator tags as a paragraph (<P>) any text followed by a hard return (created by pressing the Return key). The translator tags as a break (<BR>) any text block followed by a hard return that is formatted by placing the insertion point in the text, choosing Paragraph from the Format menu and then setting Space After to 0 (zero).

Headers A header is a logical style. The size depends on the type of header. Browsers usually insert white space above and below the header and display headers as bold.

If a text is bold, the translator checks the font size and then tags the bold text according to these rules:

If the bold text is this size	The translator tags the text as
Greater than or equal to 20 points	<H1>
Greater than or equal to 18 points and less than 20 points	<H2>
Greater than or equal to 14 points and less than 18 points	<H3>
Greater than 10 points and less than 14 points	
Greater than 9 points and less than or equal to 10 points	<H5>
Less than or equal to 9 points	<H6>

Lists For each list level, the translator inserts the tag <OL> for an ordered list and <UL> for an unordered list. For each list item, the translator inserts a list-item tag (<LI>).

Horizontal rules If underscores begin and end with a hard Return, the translator inserts the <HR> (horizontal rule) tag in the HTML document.

About this HTML translator

The HTML translator included with ClarisWorks 4.0 represents the joint efforts of Claris and a dedicated team at the Highly Interactive Computing Project4 (Department of Electrical Engineering and Computer Science) at the University of Michigan in Ann Arbor.

Claris would like to express its thanks to the Highly Interactive Computing Project, including:

Brian Sullivan
Ryan Day
Sean DeMonner

Jeff Spitulnik
Amanda Pryor
Edward Andrews
Craig Braman
Elliot Soloway

Claris also extends its thanks to Dr. Barbara Kurshan of Educorp Consultants.

Crash During Startup While Rebuilding the XTND Translator List

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks utilizes a file known as the "XTND Translator List" to keep track of which file translators are available to it for opening and saving files in foreign file formats.

Occasionally, it is necessary to delete and rebuild this file. ClarisWorks will automatically rebuild this file during startup if it senses that it is not present. On Power Macintosh machines, a problem can occur which will cause ClarisWorks to crash while attempting to do this. This can happen if the machine has an alias to anything (a file, folder, or volume) that is not located on a local hard drive (e.g. a server alias) if the alias is located in the Claris folder or the Extensions folder (both of which are located within the System folder), or in any sub folder within either of these two folders.

The solution is to move such aliases to another location on the hard drive (or to the desktop) before starting up ClarisWorks. After ClarisWorks has successfully started and rebuilt the XTND Translator List, the aliases can be moved back to their original location, if desired.

MacDraw Pro, ClarisDraw, & ClarisImpact: QuickDraw Limits on Document Size

The maximum document size in MacDraw Pro, ClarisDraw and ClarisImpact is limited by QuickDraw.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Because of limits with QuickDraw (the method that MacDraw Pro, ClarisDraw and ClarisImpact use to describe objects), these applications have limits on printed document size. This maximum size is dependent on the resolution of the document.

Any single object larger than 113.77 inches printing at 300 dpi (the resolution of the LaserWriter) will print incorrectly. MacDraw Pro worked around this by limiting the document size to 100"x100".

To calculate this size, divide 2^16 (which is the largest integer range that QuickDraw can handle) by 2 to get the maximum positive value. Next, take that number and divide it by QuickDraw's resolution, 72 dpi. The resulting number should be divided by the scaling used by the application in order to print to the chosen printer.

To calculate the maximum size for a document to be printed to a LaserWriter, for example:

2^16 = 65,536 (largest integer range).
65,536 / 2 = 32,768 (maximum positive value)
32,768/72 dpi (QuickDraw resolution)= 455.11".

ClarisImpact and ClarisDraw would then scale the the object by 4 to print at 300 dpi.

455.11" / 4 = 113.77".

This 113.77" x 113.77" is therefore the maximum size for ClarisImpact and ClarisDraw.

ClarisDraw: Installer does not support installing onto remote server volumes

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

The current version of the installer for ClarisDraw uses technology which allows multiple installation options. While these options can support installation on remote volumes, such as PathWorks volumes for placing Macintosh files on Unix machines, the choice was made to not use this option with the ClarisDraw installer. Therefore it is not possible to install ClarisDraw on remote volumes.

The developers are aware of the desire on the part of system administrators at large facilities to make remote installation possible. This request is currently being considered by the development team.

ClarisDraw: MacDraw II Files Convert as Libraries

Resolving difficulties with MacDraw II Library files which have been converted to ClarisDraw

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

When you convert MacDraw II files to ClarisDraw, any document that contains library objects is automatically converted into a ClarisDraw library. The only workaround for this issue is to remove all the library objects from your document prior to converting it. In MacDraw II:

1. Open your document.
2. Choose Library from the Arrange menu.
3. Select each item in the library and click Remove.
4. Save the document.
5. Convert the file by opening it with ClarisDraw.

Opening ClarisDraw for Windows Files with ClarisDraw for Macintosh

What to do if a ClarisDraw for Windows file does not appear in the Open dialog box, refuses to open, or opens as text (or otherwise improperly) when you double-click on it
Note that ClarisDraw for Macintosh 1.0v3 corrects this problem.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

ClarisDraw for Macintosh 1.0v1 or 1.0v2:

If you try to open a file from ClarisDraw for Windows with ClarisDraw for Mac 1.0v1 or 1.0v2, it may not open, or not be listed in the Open dialog box. To open the files, hold down the option key while selecting Open in ClarisDraw for Macintosh. While still holding down the Option key, select the ClarisDraw Windows file and open it. Once the file is saved by ClarisDraw for Macintosh, you will no longer need to do this.

Background: PC files do not have a Type and Creator attribute. On a Mac, these files default to the type 'TEXT' (which is incorrect), causing the above problems. Note that ClarisDraw for Macintosh 1.0v3 does not have this problem (see below).

ClarisDraw for Macintosh 1.0v3:

ClarisDraw for Macintosh 1.0v3 now opens ClarisDraw for Windows files directly from the Open File dialog box as long as the Windows files have the .cdd (ClarisDraw Document) or .cdt (ClarisDraw Template) extension.

In earlier versions of ClarisDraw for Macintosh, you had to hold down Option while choosing Open from the File menu to force ClarisDraw for Macintosh to open .cdd and .cdt files as ClarisDraw files, instead of incorrectly using the last XTND translator in the list (usually the text translator).

This change is unclear in the readme.txt file that ships with ClarisDraw for Windows.

ClarisWorks: Percentages Don‘t Appear in Legend of a Pie Chart

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Deselecting the Color option when creating a pie chart causes percentages not to show. While there will be space for the percentages in the legend, they will not appear.

A simple workaround is to leave the Color checkbox checked while creating the chart. After clicking OK, the percentages will appear in the legend. Double-click the chart to edit the chart options. Now, click the Color checkbox so that it is unselected. Click OK and the percentages will appear in the chart.

If the chart has already been created, double-click on the chart to edit it. Click the Color checkbox so that it is selected. Click OK. The percentages appears. Double-click on the chart a second time to bring up the Chart Options dialog box. Click the Color checkbox to uncheck it, and then Click OK. The percentages now appear in the chart.

ClarisWorks: Charting Dates (SS)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Let's say you want to graph your golf scores by date so you get a line chart that shows your improvement over a period of time. You might enter the information like so:

1-1-96 98
2-3-96 96
2-14-96 95

When you chart this range of cells you will get unexpected results. Your dates will not be points on the X-axis but instead will be represented on the Y-axis as impossible dates.

The workaround is to make the dates into text values. Simply enclose the dates with quotes and preceded them with an equals sign: ="1/1/96" so that the numbers are considered text by ClarisWorks:

="1-1-96" 98
="2-3-96" 96
="2-14-96" 95

Note: The dates will not display with the equal sign or the quotes.

ClarisWorks: The File "ClarisWorks Help" Cannot be Found

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you get an error message when trying to access Help from ClarisWorks 4.0, try deleting the help files that are installed and reinstalling them.

To delete the help files:
1- Open the Claris folder, which is inside the System folder
2- Trash two files: ClarisWorks Help and Quickhelp. Empty the Trash.

Install the ClarisWorks 4.0 help files:
1- Run the ClarisWorks installer
2- Click on Easy Install and select Custom Install
3- Scroll down and click the checkbox for "ClarisWorks Help"
4- Click Install

Name Restrictions for Default Stationery for all Communication Documents in Canadian French and French ClarisWorks 4.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

In the Canadian French and also in the French ClarisWorks 4.0v1 and 4.0v4, the name of a communication stationery document for all new documents should end with a blank space and be preceded by a Control-E character. The name of this document should be "ClarisWorks CM Options "

The ClarisWorks Development team is aware of this problem and is trying to fix it in a later release of ClarisWorks.

ClarisWorks: Performing a Mail Merge

A step-by-step guide to exporting your FileMaker Pro data into a ClarisWorks database and mail merging with a ClarisWorks word processing document.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Performing a mail merge between FileMaker Pro data and a ClarisWorks document consists of a few steps that, although easy to follow, must be performed in the proper order. The first step is getting the data out of FileMaker using the Export command. Next, you convert the exported data to a ClarisWorks database file. Lastly, you perform the merge.

These steps are detailed below, and you can also use the same steps for data you keep in a ClarisWorks database. Remember: you can mail merge in word processing documents as well as spreadsheet or draw documents, so once you know these steps, you can look for new ways to apply this technique.

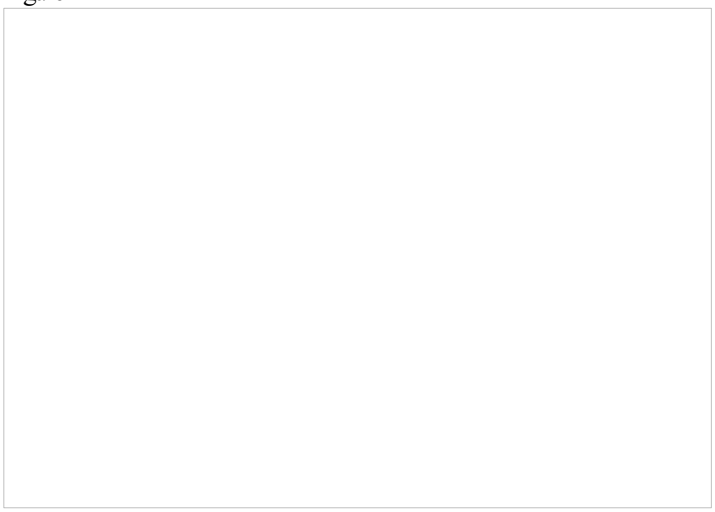
There are some limits in a ClarisWorks database file that may affect your mail merge task. Namely, the maximum number of records per ClarisWorks database document is 32,767. The maximum number of fields per document is 255. Please keep these limits in mind when you are merging data from large FileMaker Pro files. You may also need to allocate more memory to ClarisWorks.

Step One: Exporting data from FileMaker Pro

This step is necessary only if you are using FileMaker Pro, as the task is to get the data in a format that ClarisWorks recognizes. Here's how to do it:

1. Find the desired records you wish to merge in your FileMaker database. If you wish to merge all your records, choose Find All from the Select menu in FileMaker.
2. Export your records by selecting Import/Export... Export Records... in your FileMaker database. Select DIF as the file type from the pop up menu.
3. Name the file so that it has the .DIF suffix (For example, MyNames.DIF). This technique makes it easy to identify this file later on.
4. Save the file to the Desktop, so that it is easy to locate later on. If you are using System 7 (or later), click the Desktop button. Note: If you are using an earlier system, take note of the folder or directory to which you save the document. Click New.
5. In the Specify Field Order for Export dialog that appears, make sure that all the fields you want to Export are marked with a checkmark (you can click on the checkmarks to toggle them on or off). Click OK to start the Export. (See Figure 1.)
6. Quit FileMaker.

Figure 1



The preceding steps save your FileMaker Pro data as a text file only. No layouts, calculations or graphics are saved. The DIF format stores data in rows and columns, where rows function as records and columns function as fields. The important thing is that the DIF format is easily recognized by ClarisWorks, as demonstrated in the following step.

Step Two: Converting data to a ClarisWorks database

This next step converts your data to a ClarisWorks database, so that it can be used for a mail merge.

1. Launch ClarisWorks.
2. Choose Open... from the File menu.
3. If you are using ClarisWorks 1.0, click on the Import Options flag and select Database. With all other versions of ClarisWorks, select Database in the Document Type pop-down menu.
4. Locate the DIF file which contains your FileMaker Pro data. If saved to the Desktop, the DIF file appears when you click on the Desktop

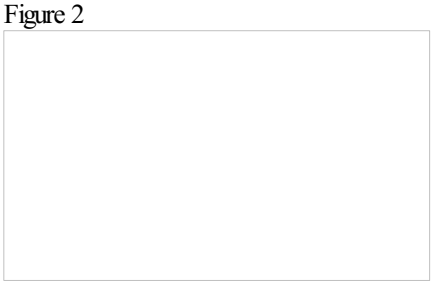
button (using System 7).
5. Open the file to convert it to a ClarisWorks database. The data appears in a standard database format.
6. Select Save from the File menu and name the ClarisWorks database. This step is important, because the database document is not available through the mail merge feature unless it has been saved.
Once the conversion is complete, you can select the records you wish to merge. ClarisWorks gives you the option to hide selected records (select the Organize Menu, then choose Hide Selected), so that you may work with smaller sets of records in your database. Only records that are visible ("unhidden") are available for mail merge.

Step Three: Performing the Mail Merge in ClarisWorks

You can now merge the data to a ClarisWorks word processing document. To merge to drawing documents, click on the Text tool from the Tools Palette and click anywhere on the document (this creates a text box) before following the steps outlined below. If you are merging to a spreadsheet document, you can insert merge fields directly into spreadsheet cells.

To perform the merge:
1. Open your ClarisWorks word processing (or other) document.
2. Select Mail Merge from the File menu. The mail merge window appears. Note: your cursor still appears in your document, allowing you to insert merge fields or continue working on your document while you are preparing it for mail merge.
Note that you can drag the Mail Merge window around the screen to make inserting merge fields easier. If the mail merge window is in your way, click in its upper right hand corner to make it shrink or grow.
3. To make the field list appear in the dialog box, select the database file.
4. Insert your merge fields by selecting the field in the Mail Merge window and clicking Insert Field. Notice that this adds a merge field where your cursor is located in the document. A merge field is indicated with special characters (e.g., «First» and «Last»). If you make a mistake, you can cut and paste merge fields into their appropriate locations.
5. If you are using ClarisWorks 4.0, clicking the Show Field Data box will let you see the actual data merged into your document. (See Figure 2.)
6. When you are ready to print your documents, click "Print Merge...". You will see the Print dialog. When you print, each record is printed.

Figure 2



You now have all you need to perform a mail merge between your database files and ClarisWorks documents.

ClarisImpact: Moving Files With Custom Styles

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Using ClarisImpact software, there are instances when you may want to create your own styles for use in charts. For example, the symbols in a flowchart may not be exactly what you need. To get the desired style you choose the closest style to what you want, click the Edit button at the bottom of the styles palette, and edit it. This is a great way to customize your charts. You can get very creative with the styles that you create yourself, and may even create a whole new style of your own that contains items that you have designed.

You can encounter difficulties when taking a file created with these customized styles to other computers, however. Whenever you move a file to another system that is using its own installation of ClarisImpact, it is important to take the style file from the computer the file was created on to the new computer. This applies to computers on the same platform as well as cross platform.

The styles are located in their respective folders. For the custom flow chart styles example, look under the following folders:

Windows
Impact:CIStyles:Flochart

Macintosh
Claris Impact:CIStyles:Flochart

If you edit the items used in the ANSI symbols, you must copy the ANSI file from this folder along with your ClarisImpact file and take it to the same location on the hard disk of the destination computer. The files carry over to other platforms just as easily. When both the ClarisImpact style and document files are copied to the proper folder or directory in the destination computer, the document can be used with the custom style information.

Note: Because of differences in naming conventions between the Macintosh and Windows operating systems, it is best to keep your style name to no more than eight characters.

Calculating Radians When the Degrees Include Minutes & Seconds (SS)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

The Radians function in ClarisWorks converts an angle measurement given in degrees into radians (the standard unit used in trigonometric functions). This function has one argument, or variable, which is the number of degrees and fractions of a degree expressed as a decimal number. If your angle measurements are expressed in degrees, minutes, and seconds, you must convert these numbers to a single decimal number within your formula in order to convert it to radians.

The following formula will do this. It assumes the degrees are in column B, the minutes in column C, the seconds in column D, and that you want to calculate the radians in column E:

E1=RADIANS(B1+(C1/60)+(D1/3600))

Published Date: Feb 18, 2012

Troubleshooting Win32s Errors in Windows 3.x

Win32s is a sub-system created by Microsoft to allow 32-bit applications to run in a 16-bit environment. These are some symptoms and solutions to the most common problems when running Win32s based applications under Microsoft Windows 3.x

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Because of the complexity of running 32-bit applications under Windows 3.x and Windows for Workgroups 3.x, occasionally you will encounter errors. This article is laid out in a logical troubleshooting order. It is recommended that you try these steps in order. After each step it is also recommended that you try to reproduce the error that you were getting initially. If the problem continues, go on to the next step.

Some of the following troubleshooting steps require good working knowledge of computers and Windows. It is advised that you seek the help of others if you are unclear or uncomfortable with performing these steps.

1. ADJUST VIRTUAL MEMORY / SWAP FILE
Virtual memory should be setup as permanent and should be at least twice the size of the amount of physical RAM that you have in your system. If a Permanent Swap File has already been established, then it is recommended that the permanent swap file be deleted and recreated. Deleting and recreating a Swap File is as easy as disabling Virtual Memory, restarting Windows, and then turning the Virtual Memory back on.

2. BOOT YOUR SYSTEM CLEAN
When booting a system clean, it is recommended that you boot with only HIMEM.SYS loaded in the CONFIG.SYS and nothing in your AUTOEXEC.BAT. If other TSRs or device drivers are necessary to boot your system, such as SCSI drivers or disk compression drivers, they should also be included. Booting with just HIMEM.SYS is all that is required to run Windows and ANY Claris 32-bit application.

Booting a system clean with DOS 6.0 or above is a simple process. Just restart your system and press the F8 key when you see the STARTING MS-DOS prompt come up. This will allow you to step through and confirm the loading of each line in your CONFIG.SYS and AUTOEXEC.BAT file. Remember to say no to everything except for HIMEM.SYS (and anything else you absolutely need).

If you do not have DOS 6.0 or above it is recommended that you create a bootable diskette with the above suggestions.

Error messages when launching Windows and slow performance are to be expected. The error messages can be ignored as long as they do not prevent you from getting into Windows.

PLEASE NOTE: Booting your system clean is not a permanent solution. The next time you start up your system normally you run the risk of the error returning. If booting your system clean fixes the errors you are getting, it is advised you consult with your PC vendor on how to better configure your system.

3. START WINDOWS CLEAN
There are three things to check when starting Windows with a basic configuration.

The first thing is to check the LOAD and RUN lines in the WIN.INI file. These files can be looked at and edited with ANY text editor. It is recommended that you comment out these two lines to prevent them from being executed. To do this, place a semicolon (;) in front of each line and save the file. The next time Windows is run, these two lines will be ignored.

The second thing to do is to check the Windows Startup Group. If there are any icons in the STARTUP Program Group they should temporarily be relocated to another group so they are not executed. After moving these icons, the next time Windows is run they will not be processed. You can also hold down the SHIFT key when restarting Windows to bypass anything in the STARTUP Program Group.

The last thing to check is the Windows Task List. Holding down the CTRL+ESC keys brings up the TASK LIST and shows everything that is running in the background when running Windows. The only thing that should be on this list is the PROGRAM MANAGER (or equivalent).

PLEASE NOTE: Starting Windows clean is not a permanent solution. The next time you start up your system normally you run the risk of the error returning. If starting Windows clean fixes the errors you are getting, it is advised you consult with your PC vendor on how to better configure your system.

4. CHECK YOUR VIDEO DRIVER
NOTE: This step may require the use of your Microsoft Windows diskettes. Make sure they are available before continuing.

It is recommended that you try reproducing the error using the Microsoft VGA driver. Older video drivers may not be compatible with Win32s and may need to be updated. Additionally, some drivers for video cards based on the S3 chip are not compatible with Win32s applications. To determine if your video card is based on the S3 chip or to inquire about updated drivers, please contact your video card vendor.

5. CHECK HARD DRIVE

It is recommended that your hard drive be checked for minor damage and/or fragmentation. Microsoft, as well as some third-party developers have created disk analysis and repair utilities as well as utilities to optimize disk performance. Two such utilities that ship with DOS 6.x are SCANDISK and DEFRAG. Any equivalent utility can be used.

6. VERIFY CONFIGURATION OF THE WIN32S SUB-SYSTEM
It is very important for the Win32s sub-system to be installed correctly for any Win32s based application to function properly. To confirm the configuration of Win32s on your system, there are three things to check.

The first thing to do is to verify that the /WINDOWS/SYSTEM/WIN32S directory exists. If it does not exist then your Claris application should be reinstalled.

The second thing to do would be to test to see if you can run the FREECELL card game without error. The FREECELL card game is installed, by default, when you install Win32s. If FREECELL does not run, then your system is having a fundamental problem running 32-bit applications. Contact Microsoft Technical Support for additional information.

The last thing to do is to configure Win32s to load last in your SYSTEM.INI file. During the installation of your Claris application, it modifies the SYSTEM.INI file to load drivers necessary for Win32s to function properly on your system. By default the installer loads the Win32s driver at the top of the 386 Enhanced ([386Enh]) section of the SYSTEM.INI. Edit the SYSTEM.INI file and move the reference to Win32s from the top of the 386 Enhanced section to the bottom of the 386 Enhanced section.

7. DELETE AND REINSTALL YOUR WINDOWS BASED CLARIS APPLICATION
NOTE: It is recommended in this step that you back up your data files to prevent accidental deletion of them.

Occasionally important application files get corrupted or misplaced. Claris Windows applications come with an automated uninstall utility. The one drawback to using this utility is that it does not have the ability to automatically remove the Win32s sub-system. Therefore Win32s will need to be removed manually. Below are some basic steps in removing Win32s from your system. If you need further explanation of how to do this please see the TechInfo article "HOW TO UNINSTALL WIN32S FROM YOUR SYSTEM."

- remove the "device=c:\\windows\\system\\win32s\\w32s.386" line from your SYSTEM.INI
- remove WINMM16.DLL from the DRIVERS line in the BOOT section of the SYSTEM.INI
- delete W32SYS.DLL, WIN32S16.DLL, and WIN32S.INI files from the SYSTEM directory
- delete the WIN32S directory

Once your Claris application AND Win32s are removed, reinstall the application per the install instructions that came with your software.

8. OBTAIN THE LATEST VERSION OF THE WIN32S SUB-SYSTEM
The latest version of Win32s, as of 19 Mar 1996, is 1.30. Other Win32s applications that you might have installed since installing your Claris application may have updated the version of Win32s already. To check the version of Win32s that is currently running on your system, examine the WIN32S.INI file located in your SYSTEM sub-directory. This file contains version information, among other things.

If the version shows 1.30.XXX or greater than that indicates you have the latest version of Win32s and there is no need to update. The latest version of Win32s can be downloaded from the Microsoft BBS at 206-936-6735. The name of the file, as of 19 Mar 1996 (when this article was written), is PW1118.EXE. It is also available on the Internet at http://www.microsoft.com/kb/softlib/mslfiles/PW1118.EXE

9. RENAME THE WIN.INI FILE IN YOUR SYSTEM DIRECTORY
Renaming this file and restarting Windows will start Windows in a generic configuration. Fonts, printers, and other parameters may not function properly. If you are unable to reproduce the errors you are getting after renaming the WIN.INI, that indicates that there is something in that file that is causing a problem or the WIN.INI file has become too large for Windows to manage properly.

Troubleshooting its size and/or contents goes beyond the capability of this article or our Technical Support to assist you. At this point, it is recommended that you contact Microsoft Technical Support for information on managing your WIN.INI file.

If this does not fix the errors you are receiving, it is highly recommended that you rename your WIN.INI file back so your Windows environment functions properly.

10. REINSTALL WINDOWS & YOUR CLARIS APPLICATION IN A NEW DIRECTORY
At this point evidently there is something in your existing Windows configuration that is not compatible with your 32-bit Claris application. To confirm this, it is suggested that you installed a NEW copy of Windows in a different directory and then install your CLARIS application based on this version of Windows.

This is a drastic step and requires at least 20 megabytes of free disk space to perform. Make sure when installing Windows again that you choose a CUSTOM SETUP and that you pick a different directory for Windows other than the one it is already in.

Please consult your Microsoft documentation for further information on installing and reinstalling Windows.

Once Windows is installed, install your Claris application based on the new version of Windows.

11. WRAPUP

There are some systems out there that for some reason or another are not compatible with Win32s. If you have gone through all 10 troubleshooting steps and are still getting errors it is possible that your system is incompatible.

Here are some other things to keep in mind when troubleshooting Win32s errors:

*** Is it File Specific? -- If you can only reproduce the error you are getting when using a specific file, it is possible the file is damaged or corrupted. Contact Technical Support for more information.

*** Do you have the latest drivers? -- If you get a Win32s error when trying to print, for example, it may be due to an outdated or buggy printer driver. Contact your printer vendor for more information on updating your driver. SCSI drivers, memory managers, and other device drivers may also need updating.

*** Can you reproduce this error on another machine? -- If you have other machines at your disposal, try reproducing the problem on the other machines. If the problem follows the machines around it may be the way they are all configured or it could indicate a problem with a particular data files you might be using.

*** Keep in mind it is impossible to get a Win32s error in Microsoft Windows 95. -- If all else fails you might want to consider updating to Windows 95. Since your Claris application is already 32-bit not only will it be more stable but it will also run much faster under Windows 95 in most configurations. Windows 95, being a 32-bit Operating System already, does not need the Win32s sub-system so it is ignored if installed.

Published Date: Feb 18, 2012

Checking The Version Of Win32s Installed On Your System

There are several different versions of Win32s out there and depending in the Claris application you are using, it requires a particular version. This is a quick and easy way to determine what version may already be installed on your system

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Win32s is a sub-system created by Microsoft for the Windows 3.x and Windows for Workgroups 3.x operating systems. The Win32s libraries allow Windows 3.x and Windows for Workgroups 3.x users to run 32-bit applications in a 16-bit environment.

Since its inception, Win32s has been updated several times. Depending on the Claris application, or other Win32s based application you are using, it might be important to know about and use a particular version of Win32s. All Claris applications come with the required version for that application. However, if other applications also install their own version of Win32s it is very easy to not know what version of Win32s is installed on your system and if it is compatible with your Claris application.

To confirm the version of Win32s that is installed on your system, one of two methods may be used.

1. CHECK THE VERSION IN THE WIN32S.INI FILE.
The WIN32S.INI located in your \\WINDOWS\\SYSTEM subdirectory. It is a small configuration file that you can view with any text editor. Additionally, if Windows is configured to view INI files, you can double click on the WIN32S.INI file in the File Manager. It will bring up information similar to the following:

```
[Win32s]
Setup=1
Version=1.30.166.0

[Nls]
AnsiCP=1252

[Freecell]
Setup=1
Version=1.30.166.0

[OLE]
Setup=1
Version=2.3.130.166
```

In the above example, the version of Win32s is 1.30.166

2. CHECK THE PROPERTIES OF THE WIN32S16.DLL
The WIN32S16.DLL file is located in the \\WINDOWS\\SYSTEM directory. It is a library file used by Win32s. The version of Win32s can be checked by checking the Properties of this file in the File Manager. Locate the WIN32S16.DLL file and click on it one time to highlight it. With the file highlighted, select PROPERTIES from the FILE menu of the FILE MANAGER to view the version.

Using ImageWriters Overseas

How do I adapt an ImageWriter I or II for European power 220V 50Hz?

This article has been archived and is no longer updated by Apple.
The ImageWriter I printer requires a grounded, step-down, isolation transformer when used with a 220V power source. Using the ImageWriter I printers on a 50Hz source can noticeably affect spacing between characters.

There are already several articles in the Tech Info Library that discuss the ImageWriter II:

- "Part Available For Using ImageWriter II And ImageWriter LQ Overseas"

- "Electrical Specifications of Most Apple Hardware"

- "Using Apple Equipment Overseas"

- "Traveling with an Apple" contain more information.

Use the search criterion of "Overseas".

Macintosh Portable: How To Disable Rest Mode (11/94)

My Macintosh Portable cycles the clock speed down after a few minutes when running programs. What's going on?

This article has been archived and is no longer updated by Apple.
The slowdown that you are experiencing is actually called Rest Mode.

The Power Manager processor monitors the amount of time the Macintosh Portable has been inactive. After a period of 15 seconds without any activity, the unit goes into Rest mode. It causes the CPU to insert 64 wait states into RAM and ROM accesses, which lowers the effective clock rate to approximately 1MHz. Interrupts continue to be processed at the same rate. As soon as the trackball or mouse moves, or any peripheral device is activated, the computer returns to full speed instantly.

The following items are checked and stop the unit from entering rest mode:
- Mouse movement
- I/O activity (keyboard, trackball, modem, and so on)
- Cursor change
- Serial port access

This feature can be turned off when running Video Works or some other program that avoids detection by the rest routine. You can disable rest mode by doing this:

1) Enter the Control Panel DA and select the Portable CDEV.

2) Hold Down the Option key and press on the words "Minutes Until Automatic Sleep".

3) Click "Don't Rest" in the dialog box that appears and select "OK".

Data Charts Update Incorrectly Using DataDraw When Importing Long Values as Column Headings

DataDraw adds an extra column to the data table when updating a data chart that uses a long value from the last field in the first record of the text file as a column heading.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

In ClarisImpact 2.0, DataDraw will update a data chart incorrectly under certain circumstances. When you have a text file where the first record is imported as column headings and the value in the last field in that record has a long name, DataDraw will add an extra column to the data table linked to the data chart when it updates that graphic.

Although this extra table column does not show on the screen, it is used for charting. This can produce unexpected results. In a bar chart, an extra category will appear in the legend. In a pie chart, the size of the pie will change to accommodate the second pie that DataDraw expects to create from the additional column of data.

The work around is to shorten the value that causes DataDraw to add the extra column. For example, if you export a Merge formatted text file from FileMaker Pro, the first line could look something like this:

Product_Name,Product_Count

In this case, these are the field names from FileMaker Pro (with an underscore substituted for a space). Changing the name of the second field from "Product Count" to "Count" in FileMaker Pro and exporting the data again will eliminate the problems when the graphic is updated.

Note that when the chart is initially created, you will see no evidence of this issue. It will appear only after the graphic has been updated.

The ClarisImpact Development Team is aware of this issue.

Emailer: Using AppleScript to Close MacPPP

This article has been archived and is no longer updated by Apple.
Because there is no direct interface between Claris Emailer and MacPPP we have to rely on AppleScript to close MacPPP. This is necessary because Claris Emailer cannot cope with a user-initiated hard close, if you use a hard close in MacPPP you will have to restart your Macintosh so that Claris Emailer can again access the port.

Claris Emailer includes AppleScripts which will open MacPPP, connect, gather mail then close PPP when finished. The purpose of this article is to take you through the process of configuring a machine to take advantage of this feature.

You will need:

"Internet using MacPPP" scripts. Installed in the AppleScripts for Schedules folder in the Support Files folder in the Claris Emailer folder. These need to be moved before you use them - place the "Internet using MacPPP" scripts in the AppleScript folder in the Claris Emailer Files folder.

MacPPP Control 1.4. THIS IS NOT INCLUDED WITH THE CLARIS EMAILER PRODUCT, this can be obtained from our WEB/FTP site. Make sure you are using version 1.4. This is to be installed in the Scripting Additions folder in the Extensions folder.

MacPPP. For Macs running Open Transport you need to be running FreePPP 1.0.5. For Macs running MacTCP (so-called Classic Networking) you should be running FreePPP 1.0.5 or MacPPP 2.2.0a.

Mac/FreePPP consists of two components: a control panel called ConfigPPP and an extension called PPP.

This will be further complicated with the imminent release of FreePPP 2.5 which will supplant previous versions of BOTH MacPPP and FreePPP. It will consist of an extension, PPP and a new control panel Setup FreePPP. In theory, FreePPP 2.5 should be the choice for both Open Transport and MacTCP when it is released.

Housekeeping, or caught between a soft and a hard close.

There is now a choice of two scripts for controlling PPP: Internet using MacPPP (Soft) and Internet using MacPPP (Hard). Internet using MacPPP (Soft) uses a soft close when it completes a connection, while Internet using MacPPP (Hard) uses a hard close. Using a hard close avoids a problem that MacPPP occasionally has with dialing, but when using the hard close script, you cannot do a Connect Now between scheduled connections.

If a customer is content to do only scheduled connections, use Internet using MacPPP (Hard). If they want to be able to do Connect Now, use Internet using MacPPP (Soft).

The script assumes the application is called Claris Emailer 1.0v3. If your copy of Claris Emailer is not called Claris Emailer 1.0v3, the script may prompt you to locate Claris Emailer 1.0v3 or you may edit the script.

The script connects to the default account of the Internet service. You can also connect to another service or a specific account by editing the script.

In Claris Emailer, create a schedule that will execute this script. Select AppleScript from the Execute pop-up menu and select the script from the AppleScript pop-up menu.

ClarisDraw 1.0v3 for Macintosh: Readme

This is the Read Me file that ships with ClarisDraw 1.0v3 for Macintosh. It details the changes since ClarisDraw 1.0v1.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

ClarisDraw Important Information ?? 1.0v3

This file contains last-minute information that will help you get more from ClarisDraw. You will also find important tips in the "Troubleshooting" section of ClarisDraw's onscreen Help.

Hard Disk Space Needed During Installation

To save hard disk space, the "Easy install" option places all ClarisDraw files and only a minimal set of ClarisArt files on your hard disk. To install all of the ClarisArt files, relaunch the Installer, go to "Custom" install, and select the 'ClarisDraw ClarisArt' option.

During installation, ClarisDraw will temporarily require more hard disk space than it needs after installation is completed. This is because, during installation, the ClarisDraw Installer places compressed copies of the ClarisDraw files on the hard disk, then makes decompressed copies of these files. Once installation is successfully completed, the Installer automatically deletes the compressed files and leaves only the new, uncompressed files for your use.

Power Macintosh Installation

The "Easy Install" option places on your hard disk the appropriate Macintosh or Power Macintosh version of ClarisDraw, depending on the Macintosh being used. If you'd like to install both the Macintosh and Power Macintosh versions on any machine, use the following steps:

--Use the Easy Install option to install one complete set of files, then Quit the Installer.

--Open the 'ClarisDraw Folder' that was just installed and rename the ClarisDraw application appropriately (example: 'CD Macintosh' or 'CD Power Macintosh')

--Open the Installer a second time, choose "Custom" and select either 'ClarisDraw Application Macintosh' or 'ClarisDraw Application Power Macintosh', depending on the version previously installed.

When this installation is completed, both applications will be located in the same folder and will use the same auxiliary files.

Important: The Power Macintosh version will not run on a conventional Macintosh.

Memory

Occasionally in low memory situations an alert will appear stating "There is not enough memory to complete this operation". This is particularly common when working with paint frames, and is typical of any application with a paint feature. We suggest saving your document before continuing. If you are working with large documents and find yourself in this situation frequently, we suggest increasing the application's memory partition as described in the ClarisDraw onscreen help, or your Macintosh User's Guide.

Bad Fonts

ClarisDraw tests for bad fonts when the application is first opened. It also tests for bad fonts when opening the application after fonts have been added to your system. ClarisDraw creates a 'Claris Fonts' file which is used to display fonts in their actual typeface in the Font menu. If ClarisDraw encounters a bad font, or one that it cannot correctly add to the Claris Fonts file, an alert is displayed indicating that some fonts may be bad. These fonts will be listed in a 'Bad Fonts' text file in the Claris Folder, which is located in your System Folder. Additionally, these fonts will be displayed in the Chicago font in ClarisDraw's FONT menu. We suggest removing or replacing these fonts from your system before using ClarisDraw. Refer to the manual that came with your Macintosh for instructions on how to remove or replace these fonts. Once these fonts have been removed or replaced, throw away the 'Claris Fonts' file, also located in the Claris folder, and open ClarisDraw.

There may be some fonts that work properly in ClarisDraw and still fail our tests. The only difference between these and other fonts is that they will be displayed in the Chicago font in the Font menu. However, we suggest performing the following simple tests on these fonts before using them in the application:

1) Create some text in ClarisDraw and apply the font. If the application unexpectedly quits, this font is bad and should be removed or replaced immediately.

2) If the application does not quit when the font is applied, create multiple pieces of text, apply several different font sizes, and print the file. If the

font appears correctly on screen and when printed, then there is no need to replace or remove this font.

Exporting Documents with Bezigons Created from Text

If you create a document that includes bezigons created from text, and then save this document in EPSF, CGM, MacDraw Pro or MacDraw II format, you may see extra lines in the converted document, both onscreen and when printing. This is a limitation of Apple's "QuickDraw" object-drawing technology.

Opening or Saving Color Palettes

ClarisDraw ships with several specialized 256-color palettes. You can access these palettes by opening them from the "Colors & Gradients" dialog box in the Layout menu. Make sure that you select the 256-color palette first; the "Open" and "Save" buttons will then become available.

Illuminated Letters Library

If your drawing includes objects from the Illuminated Letters library, and you need to scale these letters, for best results do not resize a letter by manually stretching it. If you do that, the letter or number background will scale accurately, but the enclosed letter or number will not because it is an actual piece of text. Instead, use the "Scale Selection" feature from the ARRANGE menu, with the "Scale text" option selected.

ClarisDraw 1.0v3 Detailed Improvements

Claris periodically issues maintenance releases of shipping software applications. A maintenance release is identified by v2, v3, v4, etc. numbering. The improvements made in ClarisDraw 1.0v2 and ClarisDraw 1.0v3 are included in this package and are detailed below.

Better Integration with ClarisDraw for Windows
--ClarisDraw for Windows files (.cdd and .cdt) open directly from the Open File Dialog
--Wrapped text created in ClarisDraw for Windows appears correctly
--Improved import of graphics with rotated and grouped objects from ClarisDraw for Windows
--When ClarisDraw 1.0v3 is launched for the first time, a text file is created in the Claris folder named Claris Font Map, containing the following entries:
Arial=Helvetica
Courier New=Courier
Fixedsys=Monaco
Modern=Helvetica
MS Sans Serif=Helvetica
MS Serif=Times
Script=Geneva
Small Fonts=Geneva
System=Geneva
Terminal=Geneva
Times New Roman=Times
Wingdings=Cairo
A font named on the left in a ClarisDraw for Windows document will be mapped to the corresponding Macintosh font named on the right when opened in ClarisDraw 1.0v3. This list may be edited and augmented as needed by the user.

Improved Translation of MacDraw Pro Files
--Landscape documents import as landscape
--Spell checking imported MacDraw documents works correctly
--Text objects maintain correct text wrap
--Rotated text objects import correctly

System Conflict
--Memory is properly managed so closing Desk Accessories after use no longer causes a operating system conflict.

Miscellaneous
--Resizing multiple lines with arrows at end retains correct arrow orientation
--Fixed a problem printing the ClarisDraw help files to Hewlett Packard printers
--Improved printing multiple documents from the finder
--Drag selecting text now also selects the last character
--In the first row of text, up arrow goes to beginning of line
--In the final row of text, down arrow goes to end of line
--Corrected map of Japan in ClarisArt library
--Corrected images in the code flags and map symbols libraries

ClarisDraw 1.0v2 Detailed Improvements

TA43505_ClarisDraw_v_for_Macintosh_Readme.pdf

Improved Translation of MacDraw Pro Files
--Text blocks import with correct size, and without wrapping
--Document size and page orientation information are properly imported
--Extremely fine pen sizes import at ClarisDraw's minimum available size, rather than being imported at a pen width of zero.
--MacDraw II and MacDraw Pro documents with rotated polygons import with all polygons accurately placed
--Objects in MacDraw Pro files opened in ClarisDraw for Power Macintosh print properly to Postscript printers.
--MacDraw Pro files containing PICT objects import completely and with correct size and proportion

Improved compatibility with ClarisImpact
--Imported ClarisImpact files retain correct ruler settings
--ClarisImpact files with rotated models, groups or tables import properly
--ClarisImpact files with all objects locked import properly

Import and Export Improvements
--Text in files saved as a PICT, then reopened and ungrouped, retains its proper color
--Pen size is properly translated when exported to CGM format
--Arrowheads properly export to CGM format
--Inappropriate "insufficient memory" error dialog eliminated when saving large PICTÊfiles as MacDraw II or MacDraw Pro.
--Resolution of bitmapped images properly preserved when exporting to MacDraw II or MacDraw Pro
--Black and white (one-bit) files export to EPSF with only the necessary information, so they remain reasonable in size
--White text, copied to the Clipboard along with colored text, does not change the way colored text is displayed on screen after you switch to the Finder and back
--QuickTime movies export properly

Improved Printing
--Print range settings work properly with slides and handouts
--Rotated, colored text prints properly with the Apple LaserWriter 7.x driver
--Polygons and bezigons print and display properly when exported or copied from ClarisDraw, then imported or pasted into other applications and printed to a Hewlett-Packard DeskWriter printer

System Conflict
--Pop-up tools are now properly available when using System 7.1 on a Macintosh Plus, SE, Classic, PowerBook 100, or Portable

Miscellaneous
--The CommercialPi BT font displays correctly in the Font menu and in text
--ClarisDraw properly launches with a wider variety of corrupted fonts installed
--Proper line spacing is preserved even if a single line of text contains characters of varying point sizes, and line spacing is changed to a measurement other than Lines
--Objects snap correctly to the grid under a wider variety of situations
--Screen objects display properly after using the spellchecker while viewing the Master Slide
--Colors in the gradient editor display properly when in paint mode with a paint frame set for thousands or millions of colors
--Library object "thumbnails" retain their proper size in Name View
Published Date: Feb 18, 2012

ClarisWorks for Windows: Internal Spelling Error SPL01 When Spell Checking

This error can occur in ClarisWorks 3.0 and ClarisWorks 4.0 for Windows and seems to be related to the USER dictionary in one form or another

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

When spell checking a document in ClarisWorks 3.x for Windows or ClarisWorks 4.0v1 for Windows 95, it is possible to receive the following error message:

INTERNAL SPELLING ERROR SPL01

This error is caused by a problem with the way ClarisWorks is configured to use the USER dictionary that is installed on your machine. Please consult the troubleshooting tips listed below depending on the version of ClarisWorks that you are using. The steps below do require an intermediate comfort level with Windows, if you are uncomfortable with making the changes suggested below, please consult a technician. To verify which version of ClarisWorks you are using open Claris Works and go to the Help menu and choose About ClarisWorks.

CLARISWORKS 3.x
Most likely this error is being caused by a corrupted USER dictionary. To confirm this the USER dictionary should be deleted and recreated. Any new words that you had ClarisWorks "learn" during previous spell checks will be lost. By default, the ClarisWorks 3.x USER dictionary is called USER.USP and is located in your CLARIS directory. This file, or it's equivalent should be deleted or renamed before recreating the new file.

To recreate the USER dictionary file follow these steps.
1. Choose WRITING TOOLS from the EDIT MENU
2. Choose SELECT DICTIONARIES
3. In the SELECT DICTIONARIES dialog box, choose USER DICTIONARY from the SELECT DICTIONARY drop down list
4. In the FILE NAME box, type in a new name for your dictionary (i.e, USER) and click on the NEW button.
5. Close ClarisWorks

The next time you restart ClarisWorks, it will activate the new USER dictionary

CLARISWORKS 4.x
Most likely this error is being caused by ClarisWorks being configured to use an invalid USER dictionary. In this case all that needs to be done is to configure ClarisWorks to use the proper USER dictionary.

To switch what USER dictionary is being used in ClarisWorks 4.x follow these steps:
1. Choose WRITING TOOLS from the EDIT MENU
2. Choose SELECT DICTIONARIES
3. In the SELECT DICTIONARIES dialog box, choose USER DICTIONARY from the FILES OF TYPE drop down list
4. Confirm that the CURRENTLY SELECTED DICTIONARY is not already configured to a valid USER dictionary. A valid USER dictionary should have a USP file extension. If this appears to be configured correctly, then your USER dictionary could be corrupt and needs to be replaced.
5. Navigate through your directory / folder structure until you locate the USER.USP file and double click on it.
6. Close ClarisWorks

When you restart ClarisWorks, it will activate the new USER dictionary.

If you find it necessary to recreate your USER dictionary, follow these steps
1. Delete your old USER dictionary (the file with the *.USP extension)
2. Choose WRITING TOOLS from the EDIT MENU
3. Choose SELECT DICTIONARIES
4. In the SELECT DICTIONARIES dialog box, choose USER DICTIONARY from the FILES OF TYPE drop down list
4. In the FILE NAME box, type in a new name for your dictionary (i.e, USER) and click on the NEW button.
5. Close ClarisWorks

When you restart ClarisWorks, it will activate the new USER dictionary.

Claris Products: International Country Codes

Claris products (besides the U.S. English versions) have a language code, which indicates the language that they are localized in. This is a guide to all of the codes.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
International versions of Claris products have a Language code (one or two letters), the US English products do not. This Language code is placed between the version and the revision letter. For instance a Spanish version 4.0v1 of ClarisWorks (4.0 is the version and v1 is the revision) will be : "ClarisWorks 4.0Ev1".

Language code.....Language

ClarisDraw 1.0v2 for Windows: ReadMe.txt

This is the complete ReadMe.txt file that ships with ClarisDraw 1.0v2 for Windows. A detailed list of changes from ClarisDraw 1.0v1 appears toward the end.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

WELCOME TO CLARISDRAW 1.0!

This Read Me file contains technical notes and tips that may prove helpful when you use ClarisDraw 1.0, as well as the latest news about great features of ClarisDraw.

I. TECHNICAL NOTES AND TIPS

A. Installation

Follow the instructions in the installation guide to install ClarisDraw. You can't copy the files to your hard drive using the DOS copy command, because the files are compressed to fit on fewer disks. The setup program decompresses files during installation.

You must be running SMARTDRV.EXE to install ClarisDraw. Claris recommends using the default values for SmartDrive.

ClarisDraw is a 32-bit application. Before installing ClarisDraw on a computer running Windows 3.1 or Windows for Workgroups 3.11, you must install Win32s, which is included in this package.

Note: If you are using Windows 95, do not install Win32s.

Some virus checking software may interfere with the installer or slow down the installation

process. Turn off any virus checking software before starting the ClarisDraw Installer. You can turn virus checking back on after your installation is successful.

You cannot start ClarisDraw from a directory whose name contains upper ASCII characters (for example é, ©, £). This is a limitation of Win32s.

B. In-box Support Materials

Installation Guide
User's Handbook
Context-sensitive Help system
2,400 piece SmartSymbol® clip art library

C. System Requirements and Compatibility

IBM and compatible personal computers, 386 or higher processor, and a recommended 8Mb of RAM.
Hard disk with 15Mb (to install all clip art libraries) available and Windows 3.1 or higher.
Printers supported: Hewlett Packard LaserJet, PaintJet, DeskJet series. Postscript printers such as Apple LaserWriter, IBM Laser Printers, and a wide variety of other Windows compatible printers.

D. Error messages

If you encounter an error message that indicates there is not enough memory to perform an operation, Claris recommends:
--adjusting your Virtual Memory setting (see Performance tips for

Windows 3.1 and Windows for Workgroups 3.11 below)
--removing any unnecessary drivers and TSRs from the CONFIG.SYS file to free up more memory in DOS
--closing other applications and ClarisDraw documents that are running in the background

If either XTNDGR32.dll or XTNDGR95.dll is not present in the Claris directory, ClarisDraw will not launch. Reinstall the XTND option in Custom Install. (If XTNDGR95.dll is not present, the alert erroneously states "XTNDGR32.dll is not present".)

E. Performance tips for Windows 3.1 and Windows for Workgroups 3.11
32-bit applications such as ClarisDraw 1.0 require that Virtual Memory is on. To improve performance on computers with 8 MB of memory or less, Claris recommends setting virtual memory to permanent and using the suggested size for your virtual-memory setting as displayed in the Virtual Memory dialog box. This value is typically twice the size of physical memory, but should be at least 11,700 K or 11.7 MB.

If the suggested size of virtual memory is less than twice the physical

memory installed on your computer, you might need to increase your free disk space by removing unwanted files or defragmenting your hard disk.

Note: DOS 6.0 users can use DEFRAG.EXE.

To set virtual memory:
1. In the Program Manager, open the Main Group, double-click the Control Panel icon, and then double-click the 386 Enhanced icon.
2. Click Virtual Memory and then click the Change.
3. Select Permanent from the Type pop-up menu.
4. Click the checkbox next to Use 32-Bit Disk Access. Note: This setting is NOT recommended for laptops running on battery power.
5. Click OK.

If you are an experienced Windows user and you have adjusted your virtual memory settings as described, but still want to improve your system's performance:

--In DOS, run:
DEFRAG
MEMMAKER

--Change the following settings in the CONFIG.SYS file:
FILES=60
STACKS=9,256

--Add the following line to the CONFIG.SYS file:
BUFFERS=10

--Add the following line to the [WINDOWS] section of the WIN.INI file:
DefaultQueueSize=16

--Add the following lines to the [386enh] section of the SYSTEM.INI file:
DMABuffersize=64
XLatBufferSize=128
MaxBPS=768

--Delete the following lines from the [386enh] section of the SYSTEM.INI file:
EGA80W0A.FON...
EGA40W0A.FON...
CGA80W0A.FON...
CGA40W0A.FON...

--Always use SmartDrive!

F. Using ClarisDraw with Windows 95
You cannot launch ClarisDraw 1.0 using the Network Neighborhood feature of Windows 95.

Use a different method to launch ClarisDraw instead (for example, use Explorer).

G. Printing
If you have trouble printing, try installing an updated printer driver, available from your printer manufacturer or Microsoft Corporation. For instructions on installing a driver and configuring your printer, see the the Control Panel information in the Microsoft documentation. ClarisDraw requires a valid default printer driver, NOT the Generic/Text Only driver.

To select or change the default printer:
1. In the Program Manager, open the Main Group, double-click the Control Panel icon, and then double-click the Printers icon.

2. Select a printer from the Installed Printers list and click Set As Default Printer. If no printers appear in the list, see your Microsoft documentation for instructions on installing printers.

Printing with Hewlett-Packard printers in PCL mode:
Under some conditions, the default settings for printers using PCL mode will not print rotated text correctly. To change the default settings:
1. In the Program Manager, open the Main Group, double-click the Control Panel icon, and then double-click the Printers icon.
2. Select the printer under "Installed Printers", then click Setup.
3. In the Setup dialog box, click the Options button. Change the Graphics Mode option to "Raster", then click OK for each dialog box. Click Close for the setup box, and exit Control Panel.
(Note: for Windows 95 users, please see your Win95 documentation for changing printer properties).

H. Video cards and drivers
If your screen doesn't display objects correctly, you may have a problem

with your video driver. Try changing the resolution to 640x480 or 800x600 or try changing the number of colors displayed (for example, 256, 32K, or millions of colors).

To verify a video driver problem, change the video driver to Windows standard VGA and run ClarisDraw. If the problem disappears, contact the video card manufacturer for the latest version of the video card driver or use the driver that is included with the Windows installation.

I. ClarisDraw INI file settings
If you experience either of the problems listed below, make the suggested changes to the [ClarisDraw] section of the CLARIS.INI file in your Windows directory:
--Problem:
Color/gradient palettes do not draw completely, or show up with black or missing colors/gradients
Suggested setting:
Cache Palettes = 0

--Problem:
Tools are not drawn correctly, or display as black
Suggested setting:
BitmapTools=0

J. Fonts
If fonts do not display or scale correctly (for example, if they are clipped or overlap), Claris recommends that you:

--Make certain a valid printer driver is selected as the default and that it is NOT the Generic/Text Only driver
--Enable TrueType fonts (see below)
--Make certain the standard Windows fonts, such as Arial, are

properly installed

To delete or reinstall standard Windows fonts, see the Microsoft documentation.

To enable True Type fonts:

1. In the Program Manager, open the Main Group, double-click the Control Panel icon, and then double-click the Fonts icon.
2. Click TrueType, and then click Enable TrueType Fonts.

K. Sharing ClarisDraw files between the Macintosh and Windows

ClarisDraw 1.0 for Windows has the same file format, user interface, and features as ClarisDraw 1.0 for the Macintosh. You can create a ClarisDraw document in Windows and edit it on an Apple Mac OS computer, or vice versa. Therefore, if you work with both Macintosh and Windows versions of ClarisDraw, or if you collaborate with colleagues who use ClarisDraw 1.0 for Macintosh, you can work without translating files.

To open a ClarisDraw 1.0 Windows file using ClarisDraw 1.0 for the Macintosh:

1. Hold down the Option key and choose Open from the File menu.
2. Choose ClarisDraw in the Show section of the Open dialog box.
3. Double-click on the name of the file you want to convert.

To open a ClarisDraw 1.0 Macintosh file using ClarisDraw 1.0 for Windows:

1. If you are using Windows 3.1 or Windows for Workgroups 3.11, make sure the filenames of the Macintosh ClarisDraw files you want to convert follow DOS filename conventions (8 characters or less) and end with the .CDD extension. (For ClarisDraw Library files, use the .CLB extension.)
2. Open the files in ClarisDraw 1.0 for Windows.

If you want to transfer ClarisDraw files between platforms via 3.5-inch disks, you must use a file transfer program that lets you create and use PC-formatted 3.5-inch disks on a Macintosh. To copy the ClarisDraw files onto a PC-formatted disk, follow the directions in the documentation for the file transfer program you are using. When you use a multi-platform server (such as Novell Netware) to transfer files from a Macintosh to a Windows computer, you can use

the ClarisDraw documents right off the server. No file transfer program is required.

Fonts, margins, page breaks, and some graphics might display differently when a file is transferred between Macintosh and Windows. You might have to adjust the margins and page breaks in the transferred file to restore the original appearance.

You can minimize font problems by installing and using the TrueType fonts that ship with Windows. When you open a file, ClarisDraw first checks to see if each of the fonts in the document is installed in the current system. If a font is not installed, ClarisDraw checks its font mapping information to substitute an appropriate font. Font mapping information is stored in the Claris Font Map file inside the Claris folder in your System folder on Macintosh and in the [ClarisFontMap] section of the CLARIS.INI file in your Windows directory on the PC. If a font is not listed in the font mapping file, it is mapped to Helvetica on the Macintosh and to Arial on the PC.

L. Network installation issues

ClarisDraw can be installed and run simultaneously by multiple users off of a server. See the "ClarisDraw for Windows Installation Guide" for information on how to set up ClarisDraw on a server.

Multiple simultaneous users can share ClarisDraw palettes. However, if simultaneous users edit the same palette, only changes from the last save are

retained. For this reason, Claris recommends that users who access ClarisDraw from a server and who want to customize palettes should store their PALETTES directory on their own hard disks.

Multiple users cannot simultaneously open the same ClarisDraw document or library.

M. Converting MacDraw Pro files to ClarisDraw 1.0 for Windows format

If you have ClarisDraw 1.0 for the Macintosh, use the procedure below to convert MacDraw Pro files. If you don't have ClarisDraw 1.0 for the Macintosh, you will need to acquire the MacDraw Pro Convertor application from Claris*.

To acquire the converter using America Online, use the keyword "Claris", click on the software library icon, choose "Updaters@Utilities" from the list that appears, and click on "MDPro --> C.Draw Win Converter".

To acquire the converter using CompuServe, go "WINCLARIS", click on the Browse Libraries icon, choose "General Info/Utilities" from the list, and click on "Convert2DOS utility to convert M..."

To convert a MacDraw Pro file:

1. Open the MacDraw Pro file in ClarisDraw 1.0 for the Macintosh.
2. Save the file as a ClarisDraw file with a name that follows DOS file naming conventions (8 characters or less) and ends with the .CDD extension (for example, PARIS.CDD).
3. Open the file in ClarisDraw 1.0 for Windows.

N. Paint mode color palettes
In Paint mode, the color palettes each display the default 256-color ClarisDraw palette rather than a palette customized according to the colors in a paint frame.

ClarisDraw 1.0v2 Detailed Improvements

Claris periodically issues maintenance releases of shipping software applications. A maintenance release is identified by v2, v3, v4, etc. numbering. The improvements made in ClarisDraw 1.0v2 and ClarisDraw 1.0v3 are included in this package and are detailed below.

Improved Use of ClarisImpact files

· ClarisImpact 2.0 drawing and presentation files can be read
· More that one art library can be opened simultaneously
· Custom color palettes can be imported
· Improved translation between ClarisDraw and ClarisImpact

Miscellaneous

· Right mouse button shows Windows95 menus
· Black and white CGM images import correctly
· Corrected map of Japan in ClarisArt library
· Corrected images in the code flags and map symbols libraries
· Under Windows95, selecting ClarisDraw Options Template (*.cdt) in the Save dialog will not automatically switch to the Claris directory. An Options file must be located in the Claris directory to be invoked with subsequent File:New commands.
· Under Windows95, orientation of printed bound text with non-standard

fonts to PostScript printers is incorrect with default printer settings. To correct this, open Print Setup, click the 'More' button, PostScript tab, and select Optimized for Portability.

II. GREAT FEATURES OF CLARISDRAW 1.0

A. Cross-Platform Support

ClarisDraw 1.0 is now available for Windows and Windows 95 as well as the Macintosh and Power Macintosh. You can easily exchange files between platforms, because no file translation is required.

B. Great Looking Graphics

Get creative with a broader palette of colors and gradients. Get your work done faster using the object info palette and zooming controls. The ClarisArt libraries contain over 400 new clip art images to increase the variety of high-quality art you can use in your charts and graphics.

C. Breakthrough Graphic Intelligence

SmartSymbol Libraries dramatically speed up the creation of graphics with drag and drop ease, and you can add your own frequently used graphics to a custom library. Editing is easier as you can search and replace objects

dragged from libraries, just as with text.

ClarisDraw 1.0v2: Cannot Open a ClarisImpact 2.0 library

Opening ClarisImpact 2.0 Libraries in ClarisDraw 1.0v2 can cause error messages.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
ClarisDraw 1.0v2 cannot open a ClarisImpact 2.0 library. It will display the following message : "This file was created by a newer version of ClarisDraw and can't be opened "

ClarisDraw 1.0v3 fixes this issue (this information is not in ClarisDraw 1.0v3 read me file).

SAM 2.0: Fix for MPW Linker Problem

SAM 2.0 has a problem with the MPW Linker. It refuses to learn about the MPW Linker adding CODE resources. What can I do?

This article has been archived and is no longer updated by Apple.
Here is the fix for the MPW Linker problem:

1) Open SAM Intercept's resource fork with a HEX file editor (for example, FEdit).

2) Search for this hex string: "210370427ECFB8DE7E3A5C8F2874AE1B".

3) Change it to: "230370427A64DE3E18023C1F0C35E07E".

4) Save the changes.

5) Close the file.

6) Restart your Macintosh.

ClarisWorks: Footer Only on Page One in Stationery File

How to work around the limitation of no built-in ability to have a title footer

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
ClarisWorks does not have a built-in command to create a title footer (a footer that only appears on the first page of a multi paged document). Although you can insert a section break at the end of the first page, this is not helpful when creating a stationery or template file. If you create a blank file with a section break, then type into the document, the section break gets pushed down the document as you type.

The workaround described below involves typing what you want to have appear at the bottom of the first page as a text object, placing the object at the bottom of the first page, then using the Text Wrap feature to wrap the document text around the text object.

Here are the steps:
1) Select Show Tools from the View menu
2) Click on the text tool (A)
3) Option+Drag (Macintosh) / Ctrl+Drag (Windows) a rectangle into your document. This creates a text object.
4) Type or Paste in the text you wish to have appear at the bottom of the first page.
The text will be pasted as a separate object on top of the main document frame.
5) Press Enter on the numeric keypad. You'll see the selection / resize handles in the corners of the text object.
6) Drag the object to the bottom of the first page.
7) Drag out the selection handles to the left and right sides of the page guides.
8) With the text object selected, choose Text Wrap from the Options menu and set text wrap to Regular Wrap.
9) Choose Lock from the Arrange menu.
10) Choose Save As... Stationery file from the File menu

The text you type into the document will wrap around the text object.

ClarisImpact 2.0: AppleScript Dictionary

AppleScript commands for ClarisImpact 2.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The ClarisImpact 2.0 AppleScript dictionary includes only the 6 commands listed below. There is no ability to do a menu item or copy and paste. For additional flexibility in working with other applications such as FileMaker Pro, a solutions developer will need a scriptable third application such as QuicKeys from CE Software.

ClarisImpact 2.0 AppleScript Dictionary

open: Open the specified object(s)
open alias -- list of objects to open

print: Print the specified object(s)
print alias -- list of objects to print

quit: Quit application
quit

run: Sent to an application when it is double-clicked
run

Save Document: Saves the front most document.
Save Document string -- Optional parameter. This is the name of the document you want to save. If not specified the top most window will be saved.
[New Name file specification] -- Optional parameter. This contains a new full path and file name. If not specified the current window name will be used for the filename and the

file will be saved to the application folder if not previously saved.

Close Document: Closes the front most document.
Close Document string -- Optional parameter. The name of the window to close. If not specified the top most window will be closed.
Save boolean -- Required parameter. Do you want the document saved before closing?
[New Name file specification] -- Optional parameter. This contains a new full path and file name. If not specified the current window name will be used for the filename and the file will be saved to the application folder if not previously saved.
Result: 'Null'

ClarisWorks for Windows 4.x: Files Added During Installation

Here is a breakdown of all the files installed by ClarisWorks for Windows 4.x, as well as all changes that are done to the Windows Registry

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

The following files are installed by ClarisWorks 4.0. By default the ClarisWorks installer will create the following directories / folders.

C:\\PROGRAM FILES\\CLARIS CORP\\CLARISWORKS 4.0
C:\\PROGRAM FILES\\CLARIS CORP\\CLARISWORKS 4.0\\ASSISTNT
C:\\PROGRAM FILES\\CLARIS CORP\\CLARISWORKS 4.0\\LIBRARY

'hkey_classes_root\\.usp'
'hkey_classes_root\\claris.userdictionary'
'hkey_classes_root\\.cwl'
'hkey_classes_root\\clarisworks.library.4'

The Registry is a database, under later versions of Microsoft Windows (95 and NT), that contains startup and configuration information. A Registry Key is a category of information stored in the Registry. Registry data describes user preferences, hardware settings, and other configuration information. The registry keys are the means used to index that data. For more information on the Registry and Registry Keys, please contact Microsoft's Technical Support.

ClarisWorks: Setting a Default Font In a Word Processing Document or Stationery

Opening a new document, changing the default font, selecting a drawing tool and and saving the document without typing anything does not retain the new default font.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

If you open a new ClarisWorks Word Processing document and change the font, select a drawing tool, then save the file without any other typing, will not cause it to retain the new font setting. This behavior happens only when the only change is the font.

For example:

1) Open a new document. Set the font to the font you desire.
2) Select any tool on the palette. It doesn't matter if you create an object.
3) Close and save the document.
4) Open the document and begin typing.

You will find that the font will be the original default font, either Helvetica or the font set in your stationery file, if you have one.

Workarounds:

1) Open a new document. Set the font to the font you desire.
2) Change another character setting, such as size or style.
4) Save the file.

OR

1) Open a new document. Set the font to the font you desire.
2) Type a space. The font of that space is now your selected font.
3) Move the cursor back to the beginning, to the left of the space.
4) Save the file.

TA43516_Ethernet_Bridges_and_Routers_(TIL05688).pdf

Ethernet: Bridges and Routers

I need to have 20 Macintoshes on an Ethernet network but want to isolate them from the backbone. I like the Internet router, but need IP routing. Is there a bridging product that supports multiple protocols and does Ethernet-to-Ethernet bridging? Does DEC have such a product?

This article has been archived and is no longer updated by Apple.
Bridges operate at the datalink layer level and are usually indifferent to network protocol. Routers operate at the network layer level and route only specific protocols.

DEC does have bridges that "routes" IP, as do Cisco, CableTron, Ungermann-Bass, Redix, NCS, ACC, and so on. Be aware, however, that some of the older bridges may not pass both 802.3 and Ethernet packets. If you want to isolate the network segment from the backbone, yet route IP and AppleTalk packets, Cisco is one example of the many companies that can provide this support (product descriptions are on AppleLink). They're among many developers of products sometimes called "brouters" or bridge-router hybrids.

ClarisWorks 4.0: Macros Don‘t Record Moving Paragraph Indent Markers

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

In ClarisWorks 4.0 Macintosh, if you record a macro which includes moving the paragraph indent or first line markers in the ruler, these movements are not recorded.

These marker indents could be recorded in ClarisWorks 2.0. These macros, when converted to 4.0, will probably not run.

The best workaround is to record the macro in ClarisWorks 4.0 using the Paragraph... command to change the indent and first line positions, rather than changing them manually.

ClarisWorks: Using with WorldScript

Using Apple's Language Kits with ClarisWorks

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
WorldScript is the Apple Macintosh technology that allows more than one language's system of fonts, keyboards, and input methods to exist in the system software at the same time. It is available for System 7.1 or later.

ClarisWorks 4.0 and ClarisWorks/AppleWorks 5.0 (U.S. versions) software support the following language scripts:

Roman (The standard English script. This script is also used for Italian, Danish, Dutch, Finnish, French, French Canadian, German, Norwegian, Spanish and Swedish)

Japanese
Chinese (both simplified and traditional)
Cyrillic

These scripts read left-to-right, like English. Please note that the Japanese and Chinese Language Kits allow only left-to-right text in ClarisWorks, not top-to-bottom vertical text.

Scripts that read right-to-left, such as Arabic or Hebrew, are not supported in the U.S. versions of ClarisWorks. Arabic versions or Hebrew versions of ClarisWorks are not available in the U.S. due to distribution agreements, even though the promotional materials, the box, and the Read Me file which ships with the language kits may give the impression that they are.

The only way to use the Hebrew or Arabic Language Kits and have right-to-left text in ClarisWorks is under the following circumstances:

1. The U.S. version of the Mac OS
2. ClarisWorks Hebrew or ClarisWorks Arabic (neither of which is available in the U.S.)
3. The Hebrew or Arabic Language Kit.

For further information, please see the following two TIL articles:

article# 56569: "**Language Kits, WorldScript, and Claris**"
article# 56573: "**ClarisWorks 4.0 is WorldScript Ready**"
Published Date: Feb 18, 2012

Fonts Make It Possible to Create the Appearance of Rotated Fields

Two fonts, TomatoRolledLeft and TomatoRolledRight, make it possible to imitate a rotated field in FileMaker Pro and ClarisWorks.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Although it is not possible to rotate a database field in FileMaker Pro or ClarisWorks, there is a font available called TomatoRolledLeft and TomatoRolledRight that will often produce acceptable results. The characters in these fonts are rotated (left or right as indicated by the name). To use these fonts, enter returns between each character. It is also possible to use a calculation to enter returns between each letter in a field. The following calculation will add returns between the first 5 characters in a field. The calculation can be expanded to handle longer values.

Replace(Replace(Replace(Replace(Field,5,0,"¶"),4,0,"¶"),3,0,"¶"),2,0,"¶")

Both fonts are available in the Software Library areas of online services, or on the Internet via the ftp archives.

What‘s Inside the Extensions Folder of System 7.5.3

A detailed description of what is installed in the Extensions Folder in System 7.5.3.
This article has been archived and is no longer updated by Apple.
About this document

If you're curious about the contents of the Extensions folder, this document provides a brief description of each extension. You can use these descriptions to help determine which extensions you may need and which ones you may not need.

What is an extension?

An extension is a small file that changes how your computer operates. Unlike a control panel, you typically do not have any direct interaction with an extension. An extension makes the appropriate changes when you start your computer and remains active until you shut down your computer.

Depending on the type of computer you have, the contents of your Extensions folder may vary. You might have extensions that were added by third-party applications, and you donÕt need to have all the extensions described below. You can use the Extensions Manager control panel to turn off any extension you donÕt need.

9500 Guide Additions: Adds step-by-step instructions for using features specific to the Power Macintosh 9500 to the onscreen help provided in Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

A/ROSE: Allows communication between your computerÕs main logic board and NuBus cards that run the Apple Real-Time Operating System. Examples of such NuBus cards include the Apple Token Ring 4.16 NB card and the Apple Serial NB card.

About Apple Guide: Provides information about how to use AppleÕs onscreen help system. You can access About Apple Guide from the Guide (question mark) menu when the Finder is active.

AppleCD Audio Player Guide: Provides step-by-step instructions for using the AppleCD Audio Player. You can access the AppleCD Audio Player Guide from the Guide (question mark) menu, after you install and open AppleCD Audio Player.

Apple CD-ROM: Enables your computer to use an Apple CD-ROM drive.

Apple Color Printer: Enables your computer to print documents on an Apple Color Printer.

Apple Color SW Pro CMM: Contains color-matching information used by ColorSync 2.0 to maintain consistent color between documents.

Apple Guide: Adds Apple Guide functionality to your computer. Apple Guide is AppleÕs integrated onscreen help system.

Apple Photo Access: Part of the CD-ROM software for viewing Kodak PhotoCDs.

AppleScriptLib: Provides native support for AppleScript on PowerPC-based computers.

AppleScript: Enables automation of repetitive tasks in applications that support it.

AppleShare: Gives you access to shared disks on the network.

AppleTalk ImageWriter: Enables your computer to print documents on a networked ImageWriter II.

AppleVision Guide Additions: Adds step-by-step instructions to Macintosh Guide about how to use AppleVision displays with your computer. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

Assistant Toolbox: This is the base extension for AutoRemounter. AutoRemounter works on Macintosh PowerBook computers and allows file synchronization, battery management, and easy mobile computing. It also provides support for a persistent RAM disk and deferred printing. This extension may conflict with the LaserWriter Select 310 printer software to block printing. A solution is to turn off background printing in the Chooser.

Audio CD Access: Lets you play audio CDs on your internal or external CD-ROM drive. Requires the AppleCD Audio Player or equivalent application to control the audio CD.

AV Guide Additions: Adds step-by-step instructions to Macintosh Guide about how to use AV monitors with your computer. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

AV Setup: Used to control AppleVision displays.

Caps Lock: Provides a visual indication of the state of the Caps Lock key on a Macintosh PowerBook. When Caps Lock is turned on, an ÒupÓ arrow appears in the menu bar next to the Guide (question mark) menu. (Not needed on Macintosh PowerBook 500 series computers.)

Clipping Extension: Lets you use the drag-and-drop feature to create clipping files on your desktop.

Color Picker: Presents a standard interface for color selection. Applications can use this tool to let you choose colors.

Color SW 2000 Series CMM: Color-matching information used by ColorSync 2.0 to maintain consistent color between documents printed on a Color StyleWriter 2000 series printer and other color devices.

Color SW 2400: Enables your computer to print documents on a Color StyleWriter 2200 or Color StyleWriter 2400.

Color SW Pro: Enables your computer to print documents on a Color StyleWriter Pro.

ColorSync: Matches colors on your display with the closest matching colors on your printers, scanners, and other devices.

EM Extension: Works with the Extensions Manager control panel, which lets you specify which extensions are turned on when you start your computer.

Energy Saver Guide Additions: Adds step-by-step instructions for using Energy Saver to the onscreen help provided in Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

Ethernet (Built-In): Used by Open Transport to allow access to the built-in Ethernet port on your computer.

EtherTalk Phase 2: Lets you connect your computer to an Ethernet network.

File Sharing Extension: Enables your computer to share files and folders with other computers on your network.

Find File Extension: Lets you search for files and view the results in a single window. If you turn off this extension and choose Find from the File menu, youÕll get the System 7.1 Find dialog box instead of the Find File window.

Finder Help: Provides Balloon Help support for the Finder.

Finder Scripting Extension: Allows you to use AppleScript to automate tasks in the Finder.

Foreign File Access: Enables your computer to work with CD-ROM discs whose contents donÕt use the standard Mac OS file system (for example, ISO 9660 or High Sierra formats).

Graphics Accelerator: Provides video acceleration for the PCI video card.

High Sierra File Access: Part of the CD-ROM software that lets you view CDs with High Sierra file systems.

IIci/IIsi Monitors: Describes the capabilities of the built-in video card for the Macintosh IIci and IIsi. If you remove this file, your computer can still use the video card and you can still select the number of colors displayed on your monitor, but monitor options (such as gamma settings) may not be available.

ImageWriter: Enables your computer to print documents on an ImageWriter or ImageWriter II connected to a serial port.

ImageWriter LQ: Enables your computer to print documents on an ImageWriter LQ connected to a serial port.

ISO 9660 File Access: Part of the CD-ROM software that lets you view CDs with ISO 9660 file systems.

LaserWriter: (version 7.2) Enables your computer to print documents on a PostScript printer connected to an AppleTalk network.

LaserWriter 300: Enables your computer to print documents on a Personal LaserWriter 300, LaserWriter Select 300, or a Personal LaserWriter LS.

LaserWriter 8: (version 8.x) A PostScript level II print driver that enables your computer to print documents on a PostScript printer connected to an AppleTalk network.

LaserWriter IISC: Enables your computer to print documents on a LaserWriter IISC connected to a SCSI port. Replaced by Personal

LaserWriter SC.

LW Select 310: Enables your computer to print documents on a LaserWriter Select 310.

MacinTalk Pro: Lets your computer read text documents in human-like voices. Older computers (with 68030 or 020 processors) should use MacinTalk 3 instead.

MacinTalk 3: Lets your computer read text documents in human-like voices. Used by MacinTalk version 3. Computers with 68040 or PowerPC processors should use MacinTalk Pro instead.

Macintosh Guide: Contains step-by-step instructions for working in the Finder. You access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

MacTCP Token Ring Extension: Enables you to connect to a Token Ring network using TCP/IP protocol.

Mailbox Extension: Supports your PowerTalk mailbox. Enables the Mailbox icon to appear on your desktop.

Monitors & Sound Guide Additions: Adds step-by-step instructions for using the Monitors & Sound control panel to Macintosh Guide. You access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

My Speech Macros: Supports the Speech Macro Editor.

Network Extension: Lets you set Personal File Sharing from the Finder.

Network Guide Additions: Adds step-by-step instructions for using your computerÕs network to Macintosh Guide. You access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

ObjectSupportLib: A library developers use to support AppleScript on PowerPC-based computers.

Open Transport Guide Additions: Adds step-by-step instructions for using Open Transport to Macintosh Guide. You access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

Open Tpt AppleTalk Library: Used by Open Transport for the AppleTalk communication protocol.

Open Tpt Internet Library: Used by Open Transport for the TCP/IP communication protocol.

Open Transport Library: Used by Open Transport.

OpenTptAppleTalkLib: Used by Open Transport for AppleTalk communication protocol.

OpenTptInternetLib: Used by Open Transport. for the TCP/IP communication protocol.

OpenTransportLib: Used by Open Transport.

PB 500 Upgrade Guide Additions: Adds step-by-step instructions for using features specific to the PowerBook 500 to Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

PB 190 Upgrade Guide Additions: Adds step-by-step instructions for using features specific to the PowerBook 190 to Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

PB 2300 Upgrade Guide Additions: Adds step-by-step instructions for using features specific to the PowerBook 2300 to Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

PB 5300 Upgrade Guide Additions: Adds step-by-step instructions for using features specific to the PowerBook 5300 to Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

Personal LaserWriter SC: Enables your computer to print documents on a Personal LaserWriter SC or a LaserWriter IISC.

Portable StyleWriter: Enables your computer to print documents on a Portable StyleWriter.

PowerBook Guide Additions: Adds PowerBook-specific topics to Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

PowerBook Monitors Extension: Describes the PowerBook built-in display. If you remove this file, your computer can still use the PowerBook video card and you can still select the number of colors your screen can display, but certain options (such as gamma settings) may not be available.

PowerPC Monitors Extension: Supports the AudioVision 14 monitor.

PowerTalk Extension: Supports PowerTalk services. Includes information used by the PowerTalk key chain.

PowerTalk Guide: Provides step-by-step instructions for using PowerTalk. You can access the PowerTalk Guide from the Guide (question mark) menu, after you install PowerTalk.

PowerTalk Manager: Manages your PowerTalk mailbox and services.

Printer Descriptions: Contains descriptions for all printers that use the LaserWriter 8 printer software.

Printer Share: Provides the ability to share non-network printers (for example, the StyleWriter II) across a network.

PrintMonitor: Controls the printing process when background printing is activated.

Quadra AV Monitors Extension: Describes the capabilities of the built-in video card for the Macintosh Quadra and Centris AV computers. If you remove this file, your computer can still use the video card and you can still select the number of colors displayed on your monitor, but monitor options (such as gamma settings) may not be available.

Quadra Monitors Extension: Describes the capabilities of the built-in video card for the Macintosh Quadra and Macintosh Centris computers. If you remove this file, your computer can still use the video card and you can still select the number of colors displayed on your monitor, but monitor options (such as gamma settings) may not be available.

QuickTime: Provides built-in multimedia support for applications.

QuickTime PowerPlug: Provides native support of QuickTime for PowerPC-based computers when used in combination with QuickTime 2.0. This extension must be used in addition to QuickTime 2.0.

QuickTime Musical Instruments: Supports 30 Roland Standard MIDI sound samples that can be accessed by QuickTime applications with no additional MIDI equipment.

Scripting Additions: Extends the AppleScript language with special features, such as finding the date or time of day. With scripting additions installed, AppleScript acts as if these features are part of the language. Scripting additions are required only when a script uses them.

Serial (Built-In): Used by Open Transport to allow access to the built-in serial port on your computer.

Shared Library Manager: Provides native support for Open Transport.

Shortcuts: Explains common keyboard equivalents and other shortcuts to use in the Finder. You can access Shortcuts in the Guide (question mark) menu when the Finder is active.

SimpleText Guide: Provides step-by-step instructions for using SimpleText. You can access the SimpleText Guide from the Guide (question mark) menu, after you open SimpleText.

Speech Guide Additions: Adds step-by-step instructions for using speech recognition to the onscreen help provided in Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

Speech Recognition: Provides support for speech recognition.

SR Monitor: Used to monitor and interpret speech.

StyleWriter II: Enables your computer to print documents on a StyleWriter II. Replaced by StyleWriter 1200.

StyleWriter 1200: Enables your computer to print documents on a StyleWriter, StyleWriter II, or StyleWriter 1200.

SystemAV: Used for audio-video input.

System Speech Rules: Supports voices and speech dialects.

TokenTalk Phase 2: Used by the Apple Token Ring card.

TokenTalk Prep: Supports TokenTalk Phase II.

Tutorial Items: Provides instructions for learning basic skills on your computer. You can access the tutorial from the Guide (question mark) menu when the Finder is active.

Video Guide Additions: Adds step-by-step instructions for using video to the onscreen help provided in Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

Video Startup: Used by the Apple Video Player.

WorldScript Power Adapter: Supports language kit software on PowerPC-based computers.

Claris Applications: EPSF Translator Doesn‘t Export Colors

The EPSF translator used by ClarisDraw and other Claris applications to export and import file information can't fully handle detailed PostScript information. It imports basic color and file data, but loses data when it sends information out that contains spot (Pantone Colors) or process (CMYK) colors.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
This is because the filter is not up to the latest PostScript language standards that are used by other high-end graphics applications such as Adobe Illustrator, Adobe PageMaker, Adobe Photoshop, Macromedia FreeHand, and QuarkXPress. Setting the preferences for MacDraw Pro will not hurt the file being exported, but, if you choose no PICT preview for the EPSF translator settings, you will end up with a PostScript error when printing in QuarkXPress. There is no fix for this other than using a color or B/W PICT preview and defaulting to use CMYK separation for the image.

ClarisWorks: Supra‘s FAXcilitate Needs to be Upgraded to 2.x for Compatibility with PCI-based computers and System 7.5.3

FAXcilitate versions prior to 2.x have some difficulty faxing from "some" applications on a PCI-based Macintosh computers running System 7.5.3; one such application is ClarisWorks 4.0vX.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
FAXcilitate 1.7.x exhibits this issue. FAXcilitate 2.x is able to fax from those same applications. Supra is now recommending that users with PCI-based Macintosh computers running system 7.5.3 upgrade to FAXcilitate 2.x.

FAXcilitate 2.1 is the most current version:

NEW FEATURES:

* Power Macintosh Native
* Gray-scale faxing
* Apple Guide Support
* Fully Apple Scriptable
* QuickDraw GX support
* RapidFax supports stylized text. Change the font, size and style of your note.
* FAXQueue Monitor. Faxes are quickly spooled to the FAXQueue Monitor allowing you to go back to work while the fax imaging and sending are done in the background.

FAXcilitate 2.1 was developed by Supra Communications, a Division of Diamond Multimedia, solely for use with Supra and PSI fax modems. Contact them for further information, including updates.

ClarisWorks: Changing Default Document Settings Using Stationery

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks has the ability to store as a default many settings that are in the Preferences dialog box and other document configuration areas. Examples of such settings might be the default font, default font size, page margins, or even a default logo to place in the header. You can find the instructions in the on screen Help by going to the help index and looking under "stationery, creating."

For ClarisWorks 3.0, 4.0 and 5.0:

1. Setup a new, blank document with all of the parameters as desired.

2. Choose Save As from the File menu.

3. Change the file type from "Document" to "Stationery" by clicking on the radio button next to "Stationery". When the "Stationery" option is chosen ClarisWorks automatically chooses the correct location in which to save the file.

4. Name the file exactly as outlined in the list below, depending on the environment type.

5. Click the Save button.

Note: When creating new documents, a copy of the "options stationery" file that you have just created will open automatically, it is not necessary to choose "Start with an Assistant or Stationery" (version 3.0), or "Use Assistant or Stationery" (version 4.0). If you want to create a new document without the default stationery settings, select a standard document type (such as "Standard Word Processing") from the scrolling list in the New Document dialog box.

For ClarisWorks 1.0, 2.0 and 2.1:

1. Setup a new, blank document with all of the parameters as desired.

2. Choose Save As from the File menu.

3. Change the file type from ClarisWorks to ClarisWorks Stationery in the "Save As" pop-up menu.

4. Name the file exactly as outlined in the list below, depending on the environment.

5. Choose either the ClarisWorks application folder, or the folder named "Claris" (which is located in the System Folder) as the location in which to save the file. Do NOT choose the folder named "ClarisWorks Stationery".

6. Click the SAVE button.

Note: When creating new documents, a copy of the "options stationery" file that you have just created will open automatically. If you want to create a new document without the default stationery settings, hold down the Option key on your keyboard while clicking on the OK button in the New Document dialog box (version 1.0, or choose "None" from the Stationery pop-up before clicking on the OK button (versions 2.0 and 2.1).]

For all versions of ClarisWorks, use the appropriate name from the following list:

ClarisWorks WP Options -- Word Processing Default Options

ClarisWorks DB Options -- Database Default Options

ClarisWorks SS Options -- Spreadsheet Default Options

ClarisWorks GR Options -- Graphics Default Options (For version 1.0)

ClarisWorks DR Options -- Drawing Default Options (For versions 2.0, 2.1, 3.0 and 4.0)

ClarisWorks PT Options -- Painting Default Options (For versions 2.0, 2.1, 3.0 and 4.0)

ClarisWorks CM Options -- Communications Default Options

Adobe Type Reunion and the ClarisWorks Font Menu

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Type Reunion, from Adobe Systems, is a Macintosh System extension that groups all of the fonts of a font families together. It lists the font name once in the Font menu with the various styles of that font (bold, italic, etc.) listed in a sub-menu.

In altering the display of the Font menu, Adobe Type Reunion also disables the option to display the fonts in the menu in their own typeface (showing "Times" in the Times typeface and "Geneva" in the Geneva typeface, for instance). Normally, this feature is an option which can be turned on or off in the ClarisWorks Preferences dialog box. However, if you have Adobe Type Reunion installed, all of the font names in the Font menu will display in the default system font, regardless of the Preference setting. The only way to regain this functionality is to turn off the Type Reunion extension by disabling System Extensions.

Retaining Cell Formatting While Sorting in ClarisWorks (SS)

ClarisWorks will sort cell formatting along with the data. This article explains a method to retain the original formatting in those cases where this changes the look of the spreadsheet.
This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Formatting information such as cell color is stored as part of the data of a cell. When you sort a range of cells, therefore, the style information will be moved with the data.

On spreadsheets formatted with alternating colors, however, this can destroy the look of the spreadsheet.

Currently, there is no way to prevent this from happening but, by following the next few steps, you can obtain the same affect.

1. Select the range of data you wish to sort and choose Copy from the Edit menu.
2. Select New from the File menu and create a new Spreadsheet document. This document will only be used temporarily so you can close it without saving after you have finished.
3. Select Paste from the Edit menu to paste the data into the new spreadsheet. The style information will also be pasted.
4. Select the range of data you wish to sort, select Sort from the Calculate menu and sort the data as desired. The formatting information at this point will appear incorrect - disregard its initial appearance.
5. Select all the data again and choose Copy from the Edit menu.
6. From the View menu, select the original database.
7. With the same range of data selected in the original database, choose Paste Special from the Edit menu, select the option to Paste Values Only and click OK.

The data will be pasted into the original database in the new order but without the formatting information.

NOTE: The Paste Special feature is primarily intended to remove calculated results from their formula. If the sorted data was derived by calculations, therefore, the formulas will be removed. Solutions to this problem depend greatly on the design of the database. In most cases, you do not need to include calculated cells in the pasted information since they will be recalculated based on the new data.

Needed: Internet Router-Like Product for IP Routing

Do you know of an IP routing product that works like the AppleTalk Internet Router? Specifically, I am interested in a product that is installed on a Macintosh that does IP routing.

I like the functionality and flexibility of the AppleTalk Internet Router but need IP routing.

This article has been archived and is no longer updated by Apple.
As of April, 1990, there are no IP routing products that work with or like the AppleTalk Internet Router. (We have had repeated requests for this type of product.)

Fixes in ClarisWorks 4.0v2 for Windows 95

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The following issues have been corrected in ClarisWorks 4.0v2 for Windows 95:

1. Receiving an error message, "Internal Spelling Error SPL01," when spell checking in ClarisWorks for Windows.
NOTE: If you received version 4.0v2 in the box, the above issue will never occur.

2. Font corruption issues in files converted from ClarisWorks 3.0 for Windows. Files which were created in 3.0, opened in 4.0, saved, closed, and reopened should no longer exhibit random font/size/style changes.

3. Printing issues. A specific fix corrects the situation where ClarisWorks would crash when attempting to print a spreadsheet document which contained a cell with currency formatting and a value of 0 (zero). More importantly, a general fix corrects various sporadic printing issues associated with a variety of Windows 95 printer drivers (particularly, certain Canon BubbleJet drivers). Because this fix is rather vague, because many of the tested drivers exhibited issues in other Windows 95 applications, and because SQA does not know all of the affected printers, the ReadMe contains only very broad language on this subject, as follows:

"ClarisWorks 4.0 was tested with the printer drivers which ship with Windows 95. If you encounter difficulties while printing, you may be using a printer driver which does not function correctly with Windows 95. Reinstall the printer using the driver that came with Windows 95. Set this printer as the default printer driver."

"If you are having difficulty with a printer driver which was released after Windows 95 shipped (August 1995), make sure you are using the latest version of the driver. If that doesn't work, try going back to the version that shipped with Windows 95. If this fixes the issue, contact that printer manufacturer."

"If you encounter printing errors while printing Gradients to inkjet printers, try the Faster Gradients option. Choose Preferences from the Edit menu. In the Preferences dialog box, click the Graphics icon in the scrolling list, then select Faster Gradients."

"If you have a color matching issue, make sure you are using a Windows 95 compatible video card and printer drivers."

4. International versions of ClarisWorks 4.0v2 will now support accent marks in dialog box text.

5. The RTF filter was updated to fix a couple of issues. Most notably, ClarisWorks will no longer crash when attempting to convert RTF files that were originally created in MS Word 6.0 or AmiPro.

About ClarisWorks Version 4.0v2 Windows Updater, Readme.txt File

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
v2Update.exe

This self-extracting "v2Update.exe" archive contains the "Cwksupv2.exe" updater file and the "Update.txt" instruction file. The "Cwksupv2.exe" updater is used to upgrade the Windows 95 version of ClarisWorks 4.0v1 to ClarisWorks 4.0v2.

This release of ClarisWorks addresses several issues including printing problems with some printer drivers and occasional problems with fonts from ClarisWorks 3.0 documents being read incorrectly by ClarisWorks 4.0. It also provides an updated version of the Rich Text Format (RTF) file filter.

Installation
To install the "Cwksupv2.exe" updater and the "Update.txt" instructions file:

1) Double click the "v2Update.exe" file. (This will open an MS-DOS Prompt and begin extracting the files.
2) Once the files are done extracting, click the close box in the upper right hand corner of the MS-DOS Prompt window to close it.

The "Cwksupv2.exe" and "Update.txt" extracted files are located in the same directory as the "v2Update.exe" file.

Read the Update.txt file for instructions on updating ClarisWorks 4.0v1 to 4.0v2

About ClarisWorks Version 4.0v2 Windows Updater, Update.txt File

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks 4.0v2 Updater

Thank you for investing in Claris software. From time to time, we produce maintenance releases of our software. We'll add minor functionality, correct defects, or respond to customer requests. We'd like to make it as convenient as possible for you to obtain these new versions and enjoy their benefits.

Updates, in contrast to upgrades, contain few changes from the previous version. Instead of distributing the full, revised application, we can provide just the files necessary to incorporate the new functionality and fixes. When you run the accompanying Updater, it will combine your original ClarisWorks 4.0v1 files with the new changes to create new ClarisWorks 4.0v2 files. The following files are updated with this updater:

Clworks.exe - ClarisWorks 4.0v2 application rtf.f32 - Rich Text Format (RTF) file filter Readme.cwk - ClarisWorks document that describes general and v2 release information.

This document describes the steps you take to apply the update. You may want to print it out if this is the first update you've installed.

ClarisWorks 4.0v2 Updater will upgrade U.S. versions 4.0v1 to the current U.S. release, 4.0v2. This Updater WILL NOT update any international versions of ClarisWorks.

The information is organized as follows:
1. Guide to updating your ClarisWorks 4.0 files
2. Legal considerations

Guide to updating your ClarisWorks 4.0 files

The ClarisWorks 4.0v2 Updater can run from a hard disk or a network disk drive. However, you need to run the updater from the drive that contains your original version of ClarisWorks.

1.1 Applying the update

Quit ClarisWorks, if you're using it.

Run the Windows program CWKSUPV2.EXE included in this distribution. The updater will search for your current ClarisWorks 4.0 folder and bring up a dialog for you to select CLWORKS.EXE. If you have multiple copies of ClarisWorks, navigate to the correct one. Select the file and click Open. The updater will ask you to confirm the location. Click Yes if it's correct or Cancel to start over again if it's wrong.

The updater will then search for your current Claris folder and bring up a dialog for you to confirm its location. If you have multiple copies of the folder, selecting 'no' in the confirmation dialog will cause the updater to search again for another instance of the folder - continue selecting 'no' until the one you want to update is shown.

If any errors occur during the update process, the Updater will restore your files to their original state.

1.2 Technical Considerations

Hard Disk Space You'll need approximately 5MB of free disk space.

Virus Detection Software The Updater makes several changes to the resources in ClarisWorks. Many virus utilities consider this activity improper and may try to prevent it. To avoid this inconvenience, disable all virus detection software before applying the update.

Legal Considerations

Legal Considerations The enclosed .RTPatch updater program is ©1991-1995 by Pocket Soft, Inc. P.O. Box 821049, Houston, Texas 77282.

The software code changes contained within the Updater, the original software, and the software created by the updater program are © 1987-1996 Claris Corporation. All rights reserved. Claris and ClarisWorks are registered trademarks of Claris Corporation. All other trademarks are property of their respective owners.

The following license agreement applies:

PLEASE READ THIS DOCUMENT CAREFULLY PRIOR TO USING THIS SOFTWARE.

The enclosed computer program is an update (the Update) to ClarisWorks 4.0 (the Software). In order to use and/or copy the Update as authorized by this License, you must have validly licensed at least one copy of the Software. You are required to have a validly licensed copy of the Software for each copy of the Update made hereunder. The Update and the copies authorized herein replace your validly licensed copies of the Software and are not additional copies (i.e., you may not use the Update in addition to the Software the Update is replacing).

The Update is licensed, not sold, to you by Claris Corporation (Claris) for use only under the terms of this License, and Claris reserves any rights not expressly granted to you. You own the disk(s) on which the Update is recorded or fixed, but Claris and its licensers retain ownership of the Update itself.

1. License. This License allows you to (i) make copies of the Update, only up to the number of validly licensed copies of the Software in your possession and (ii) use each such authorized copy on a single computer at a time. You are required to have a validly licensed copy of the Software for each copy of the Update made hereunder. The Update and the copies authorized herein replace your validly licensed copies of the Software and are not additional copies. To use the Update means that the Update is either loaded in the temporary memory (i.e., RAM) of a computer or installed on the permanent memory of a computer (i.e., hard disk, CD ROM, etc.). You may use at one time as many copies of the Update as you have licenses for. You may install the Update on a common storage device shared by multiple computers, provided that if you have more computers having access to the common storage device than the number of licensed copies of the Update, you must have some software mechanism which locks-out any concurrent users in excess of the number of licensed copies of the Update (an additional License is not needed for the one copy of the Update stored on the common storage device accessed by multiple computers). If the Update is installed on the permanent memory of a single desktop computer (i.e., not a storage device shared by multiple computers) and that desktop computer is used by one individual for at least 80% of the time the computer is in use, that same individual may also use a copy of the Update on a portable or home computer.

The Update is protected by copyright law. As an express condition of this License, you must reproduce on each copy the Claris copyright notice and any other proprietary legends that were on the original copy supplied by Claris.

You may permanently transfer all your rights under this License to another party by providing to such party all copies of the Update licensed under this License, and the Software the Update replaces, together with a copy of this License and all written materials accompanying the Update, provided that the other party reads and agrees to accept the terms and conditions of this License.

2. Restrictions. The Update contains trade secrets in its human perceivable form and, to protect them, you may not REVERSE ENGINEER, DECOMPILE, DISASSEMBLE, OR OTHERWISE REDUCE THE UPDATE TO ANY HUMAN PERCEIVABLE FORM. YOU MAY NOT MODIFY, ADAPT, TRANSLATE, RENT, LEASE, LOAN, RESELL FOR PROFIT, OR CREATE DERIVATIVE WORKS BASED UPON THE UPDATE OR ANY PART THEREOF.

3. Termination. This License is effective until terminated. This License will terminate immediately without notice from Claris or judicial resolution if you fail to comply with any provision of this License. Upon such termination you must destroy the Update, all accompanying written materials, and all copies thereof. You may also terminate this License at any time by destroying the Update, all accompanying written materials and all copies thereof.

4. Export Law Assurances. You agree that neither the Update nor any direct product thereof is being or will be shipped, transferred or reexported, directly or indirectly, into any country prohibited by the United States Export Administration Act and the regulations thereunder or will be used for any purpose prohibited by the Act.

5. Limited Warranty and Disclaimer, Limitation of Remedies and Damages. YOU ACKNOWLEDGE THAT THE UPDATE MAY NOT SATISFY ALL YOUR REQUIREMENTS OR BE FREE FROM DEFECTS. CLARIS WARRANTS THE DISKETTES ON WHICH THE UPDATE IS RECORDED TO BE FREE FROM DEFECTS IN MATERIALS AND WORKMANSHIP UNDER NORMAL USE FOR 90 DAYS FROM PURCHASE, BUT THE UPDATE AND ACCOMPANYING WRITTEN MATERIALS ARE LICENSED "AS IS." ALL IMPLIED WARRANTIES AND CONDITIONS (INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE) ARE DISCLAIMED AS TO THE UPDATE AND ACCOMPANYING WRITTEN MATERIALS AND LIMITED TO 90 DAYS AS TO THE DISKETTES. YOUR EXCLUSIVE REMEDY FOR BREACH OF WARRANTY WILL BE THE REPLACEMENT OF THE DISKETTES OR REFUND OF THE PURCHASE PRICE. IN NO EVENT WILL CLARIS OR ITS DEVELOPERS, DIRECTORS, OFFICERS, EMPLOYEES OR AFFILIATES BE LIABLE TO YOU FOR ANY CONSEQUENTIAL, INCIDENTAL OR INDIRECT DAMAGES (INCLUDING DAMAGES FOR LOSS OF BUSINESS PROFITS, BUSINESS INTERRUPTION, LOSS OF BUSINESS INFORMATION, AND THE LIKE), WHETHER FORESEEABLE OR UNFORESEEABLE, ARISING OUT OF THE USE OF OR INABILITY TO USE THE UPDATE OR ACCOMPANYING WRITTEN MATERIALS, REGARDLESS OF THE BASIS OF THE CLAIM AND EVEN IF CLARIS OR AN AUTHORIZED CLARIS REPRESENTATIVE HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Claris' liability to you for actual damages for any cause whatsoever, and regardless of the form of the action, will be limited to the greater of $500 or the money paid for the Update that caused the damages.

THE ABOVE LIMITATIONS WILL NOT APPLY IN CASE OF PERSONAL INJURY ONLY WHERE AND TO THE EXTENT THAT APPLICABLE LAW REQUIRES SUCH LIABILITY. BECAUSE SOME JURISDICTIONS DO NOT ALLOW THE EXCLUSION OR

LIMITATION OF IMPLIED WARRANTIES OR LIABILITY FOR CONSEQUENTIAL OR INCIDENTAL DAMAGES, THE ABOVE LIMITATIONS MAY NOT APPLY TO YOU.

6. General. This License will be construed under the laws of the State of California, except for that body of law dealing with conflicts of law. If any provision of this License shall be held by a court of competent jurisdiction to be contrary to law, that provision will be enforced to the maximum extent permissible, and the remaining provisions of this License will remain in full force and effect. If the Software or Update is supplied to the United States Government, it is classified as "restricted computer software" as defined in clause 52.227-19 of the FAR. The United States Government's rights to the Software and Update are as provided in clause 52.227-19 of the FAR.

Translators are Not Accessible After Updating ClarisWorks 4.0CFv1 to Version 4.0CFv4

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you do not have access to the translators after updating the Canadian French ClarisWorks 4.0CFv1 to version 4.0CFv4 using the Canadian French updater , you will have to do make some manual changes to your system.

Do the following:
1) Open the hard disk
2) Open the System folder
3) Open the Claris Folder
4) Click inside the name of the Claris XTND document and add a space to the end of this name.

Now after you restart ClarisWorks you should have access to all your translators.

Linking Remote Sites Over 25-Pair Telco Wire

I want to link a remote site (approximately 3 miles) and has 25-pair Telco wire already laid from point to point. I know of the Shiva Telebridge and the Digital Access solution, but want to know if I have any alternatives.

This article has been archived and is no longer updated by Apple.
Line drivers, signal boosters, short-haul modems, CSUs, DSUs, and so on should all be available from your local telephone company or suppliers, such as BlackBox. The type you would use depends on the type of link you have (T1, 1MB, ISDN, DDS, and so on) and data rates you want to achieve.

Because you mention the Telebridge, it seems that you want to route AppleTalk packets over the link. Other products, like the Solana R-Server, the H-Server, and the Hayes InterBridge, can do this. Both the R-Server/S and the H-Server support data rates similar to that of the Telebridge.

Editor's Note 22 June 1992: Solana has discontinued business to our knowledge, so we are unable to refer you to them directly for further information.

Claris Emailer Updater 1.1v2: Previously Altered Sound Resources

There were a number of utilities available for altering the sound resource for earlier versions of Claris Emailer. They may cause issues when using the 1.1v2 updater.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Claris Emailer 1.1v2 updater (for versions 1.0v1 through 1.0v3) will copy the personalization and will skip the sound resource if the customer has replaced the original sound with a custom sound.

The updater will not work if the customer has changed, added, or deleted any other resources. In particular, it will not work if they added a new sound and renumbered the old sound.

In these cases customers will need to put aside their Claris Emailer Files folder, reinstall from their original disk, drop the Claris Emailer Files folder in the the new Claris Emailer Folder, and re-update with the 1.1v2 Updater.

Won‘t Dial Phone for Internet Connection

If Claris Emailer won't call up FreePPP to dial your Internet service provider, the option "Allow applications to open connection" may not be selected in FreePPP.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Question: When I try to connect to my Internet Provider, it won't dial. I'm using System 7.5.3 and Open Transport and FreePPP.

Answer: Claris Emailer should activate TCP/IP, which then calls up FreePPP. If FreePPP is not activated and does not dial, first check to see if you can connect directly using FreePPP, by launching FreePPP Setup on your hard drive or selecting Open FreePPP from the FreePPP menu bar item and and clicking on the Connect button.

If that works, then launch FreePPP, click on the General tab and select the option: Allow applications to open connection.

If that option is not selected, then Claris Emailer will not be able to call up FreePPP to dial the phone.

ClarisWorks: Crashes When Closing a File

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This is fixed in ClarisWorks 4.0v5 Macintosh.
An updater for all previous versions of 4.0 is available online.

If you have 48 MB or more of free memory (RAM) on your computer when ClarisWorks 4.0 launches, it will usually crash when trying to close a file. In some cases, the issue only occurs in documents of certain types, or only in documents containing headers. This is true for all Macintosh and compatible model machines, including Power-PC and 680x0 microprocessor-based CPUs. The amount of free memory may be the result of either physical RAM, virtual memory (including such utilities as RAM Doubler), or both.

The ClarisWorks engineering team is aware of this issue. At the current time, the only solution is to configure your system so that there is less than 48 MB of free RAM when ClarisWorks starts up. This can be accomplished by launching other programs prior to starting ClarisWorks (and increasing the memory allocation of these programs if necessary). You can quit these other applications once ClarisWorks is running, but will have to relaunch them prior to any relaunch of ClarisWorks.

The following examples show what you might do to avoid this issue.

Example 1
Computer with 24 MB of RAM, running RAM Doubler to 48 MB.
In this case, the issue will not occur. The system software will be using memory, so the amount of free memory will be less than 48 MB.

Example 2
Computer with 56 megabytes (MB) of real or virtual memory. System software is using 6 MB of RAM. Thus, the free memory is 50 MB. Set a program like SimpleText to a Preferred memory size of more than 2 MB. Place an alias to SimpleText in your Startup Items folder inside your System Folder. After starting your computer, there will be less than 48 MB of memory available. Launch ClarisWorks. You can then quit SimpleText.

An alternate solution may be to create a RAM disk on your system to take up the free RAM.

Creating or Modifying a File Type in Windows 95

How to Create or Modify a file type in Windows 95

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

How to create or modify a file type in Windows 95:

1) Double-click the My Computer icon.
2) On the View menu, click Options, and then click the File Types tab.
3) To create a new file type, click New Type.
4) To modify the settings for an existing file type, click the type, and then click Edit.
5) Specify a description for the file type and the filename extension associated with this type of file.
6) Click New to define an action for this file type.
If you are modifying an existing type, you can click the command in the Action box that you want to modify, and then click Edit.
7) Specify the action that you want to define, such as Open or Print, and the command that should run to complete this action.
8) Click Done to save the changes.

ClarisWorks: Plotting Null Values

Null values plot as zeros in a ClarisWorks charts. Below is a work around to hide unwanted plot lines.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

In a ClarisWorks spreadsheet line chart, a cell with no value is treated as a zero and plotted accordingly. This technique results in a chart that accurately reflects a null value.

- Create the chart with the null value.

- Using the line drawing tool, draw in plot lines directly over the existing lines. Do not draw in lines connected to a null value.

- Select the plot line with the issue by clicking in the associated color box in the legend.

- Use the line tool to select Other for the line width and set it to 0. The lines generated by ClarisWorks will disappear leaving the drawn in lines that accurately reflect a null value.

How To Format a Disk in Windows 95

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

1) Double-click the My Computer icon, and then click the icon for the disk you want to format.

2) Be sure not to double-click the disk icon, because you can't format a disk if it is open in My Computer or Windows Explorer.

3) On the File menu, click Format.

Notes:

Formatting a disk removes all information from the disk.

You cannot format a disk if there are files open on that disk.

If the disk has been compressed, use DriveSpace, or other compression software, to format the disk.

Claris Emailer 1.1v2 Updater: Installs Second Claris Emailer Folder

There is an issue with the Claris Emailer 1.1v2 Updater that will install a second Claris Emailer Folder inside of your Claris Emailer Folder if you changed the name of the Claris Emailer Folder.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you have changed the name of your Claris Emailer Folder, the Claris Emailer 1.1v2 updater will update your application file to Claris Emailer 1.1v2 and will create a new Claris Emailer Folder inside of your existing folder with all of the new Claris Emailer Files and support files in it.

To resolve this issue, rename your folder than holds Claris Emailer 1.x to Claris Emailer Folder and rerun the updater to update all of the files. You can then delete the duplicate Claris Emailer Folder.

DataDraw Primer: Growing Your Business With ClarisImpact 2.0

Tracking your business growth with FileMaker Pro 3.0 and ClarisImpact 2.0 with DataDraw.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
For years small businesses have created accounting systems with FileMaker Pro database software. With the addition of relational capabilities in FileMaker Pro 3.0, business owners have gained an entirely new suite of tools to track growth and trends of their companies. Working with layouts, individuals at all levels can combine information from multiple related databases to create quick, accurate reports.

Yet sometimes, even accurate data is not enough to get your point across. For example, a table of fiscal results is not as powerful as an easy-to-read graph, and a list of employees is not as descriptive as an organization chart. That is where ClarisImpact 2.0 software with its DataDraw feature becomes the charting companion for FileMaker Pro 3.0.

ClarisImpact 2.0 expands on the data manipulation capabilities of FileMaker Pro 3.0 by turning simple rows and columns of information into professional-looking business graphics in only a few steps. What's more, you can set DataDraw to keep the business graphics up-to-date every time you open them. Instead of performing time-consuming changes to your graphics whenever your data changes, you can have DataDraw make the changes for you.

Defining your needs

To help you understand the power and simplicity behind ClarisImpact 2.0, lets take a look at Mary Gold, owner of Gold Blooms Flower Shop, and how she uses ClarisImpact 2.0 to handle her business needs. Mary's business has two stores, and she plans to open another one within the next month. With plans for the extra staff, Mary's personnel work has increased dramatically. She needs a simple organization chart to keep track of which employees work at each store.

Mary maintains a personnel database in FileMaker Pro 3.0. The database is very useful and keeps tabs on everyone, their location, title, and phone numbers. However, what the employees of Gold Blooms need is a visual representation of the staff at each store along with their titles and phone numbers. This information is already in the personnel database, ready to be made into an organization chart, but Mary does not want to create a new chart from scratch every time a change takes place in one of her stores.

Working with FileMaker Pro 3.0

In planning her organization chart, Mary knows that she needs seven types of information: employee ID, first name, last name, title, phone number, status, and manager name. All of this information is already in fields in the FileMaker Pro 3.0 database, except for manager name. When the shop was small, there was no need to list this personnel information. Mary oversaw everything. Now, she needs the manager information to create the organization chart she envisions. Mary adds a field called Manager to her personnel file in FileMaker Pro 3.0, and uses the new ability of FileMaker Pro 3.0 to create a value list based on a field in a file. With this setup, she can click on a pop-up menu in the personnel record and see a list of all employee IDs and last names. Assigning manager names is a snap.

TIP: Since Mary Gold is the boss, she leaves her Manager field blank. DataDraw places her position at the top of the organization chart and builds the chart from there.

Once she has correctly formatted her fields the way she wants them, Mary does two more things in FileMaker Pro 3.0 to prepare for the automation process discussed later. First, she performs a Find on the Status field to find only currently active employees. She then Exports the following fields to a tab-separated text file: EmployeeID, FirstName, LastName, Title, PhoneNumber, and ManagerName. She names this file OrgChart.tab.

Preparing your chart

ClarisImpact 2.0 ships with a wide variety of organization chart styles, but sometimes you want to personalize a business graphic to reflect the individual character of your company. With ClarisImpact 2.0, you can create both custom position styles and custom organization chart styles. Once you have experimented and designed a style that meets your needs, you can save the style for use with future organization charts. Here are some basic steps that you can take to customize your chart style.

1. Begin by creating a new organization chart with one employee at each level. For Mary, that means having an owner, a manager, and a floral designer.

2. Choose Position Styles from the OrgChart menu to display the Position Styles palette (Figure 1). To create a new position style family, click the pop-up menu at the top of the Position Style palette, choose New Style, and give your new family a name in the New Style dialog box. Mary calls her style Flowers. Click OK.

3. In the lower-right corner of the palette, click the triangle to see the options for creating or customizing position styles. ClarisImpact 2.0 adds styles to the currently-selected style family. Click the New button to enter the Position Editor.

4. Use the Position Editor to create completely new position styles. In the Position Editor, you can change the shape and color of the position, customize the text style for each field, add additional fields to the position (such as phone number), move the connection points for the position, and place pictures from the ClarisArt libraries or other graphics files. Once you have made all the changes, click OK to save and return to the Position Styles palette. Now you can name the position style by entering the desired name in the Name box and click Rename. You can customize position styles for every level of your organization. Mary Gold creates three new position styles (owner, manager, and floral designer) by combining the text and graphic elements she wants with images from the ClarisArt libraries.

5. In the original organization chart, click the first level to select it. In the Position Styles palette highlight the position name that matches this level. Click Apply and the new position style is applied to the selected position on your organization chart. (You can also apply any other settings from the OrgChart menu that you want. These include changing the organization chart orientation, defining level settings so all additional positions at the same level use your new position styles, or selecting another worker layout.) Select the remaining positions and apply the appropriate style. Close the Position Styles palette and save your changes.

6. Choose OrgChart Styles from the OrgChart menu to display the Org Chart Styles dialog box (Figure 2). If your style is not already showing, click the Style pop-up menu and select it. Mary uses her Flowers style. Next, click New. You can now name and save your new style variation to the style group previously selected. Mary saved her style called Gold Blooms to the Flowers style group that she set up earlier. Click OK to exit your setup. This ensures that you will be able to reapply your style settings to any new documents.

Implementing DataDraw

Once you have designed your custom style in ClarisImpact 2.0 and set up your information in FileMaker Pro 3.0, it is time to bring together all of the pieces you have created.

Create a new ClarisImpact 2.0 organization chart using DataDraw. DataDraw steps you through the process by asking you to do the following three things:

1. Select the data file to import. This is the OrgChart.tab file we exported from FileMaker Pro 3.0 earlier.

2. Choose an Org Chart style such as the one created above.

3. Align the fields in the data file with the fields on your organization chart.

DataDraw creates the organization chart for you. Once the document is created, you can set the graphic to update whenever you open the file.

This keeps the organization chart current and ready for use. To do this, choose Auto-Update Settings from the DataDraw item of the File menu. The Auto-Update Settings dialog box appears and gives you options for updating data and graphics in your chart (Figure 3). Once your preferences are set, click OK. Finally, save your file to keep from losing all your hard work.

Mary does the same. Once Mary Gold finishes her design work, she imports into ClarisImpact 2.0 the data file OrgChart.tab that she exported from FileMaker Pro 3.0 and chooses the Gold Blooms style that she created earlier. After aligning her fields, Mary sees the results of her work instantly as her organization comes to life on her screen. All that remains for her to do is change her Auto Update Settings and save her document as GoldBlm.CID.

Automating the process
Once you have done all of the preliminary setup, you can create a script in FileMaker Pro 3.0 to automate the process. On both Mac OS and Windows, the script can Find the active employees, Export the data to a tab-separated text file, and Open the organization chart in ClarisImpact 2.0 so that the graphic updates.

If you have performed a Find or Export since you exported data to your OrgChart.tab above, do your desired Find and Export again, to be sure the correct Find and Export criteria are saved with your script.

Create the following script called Export to ClarisImpact:

Mac OS
Perform Find [Restore]
Export Records [Restore, No dialog, "OrgChart.tab"]
Send Apple Event ["GoldBlm.CID", "ClarisImpact - Mac OS", "aevt", "odoc"]
open application, open document, Bring target application to foreground

Windows
Perform Find [Restore]
Export Records [Restore, No dialog, "OrgChart.tab"]
Send Message ["GoldBlm.CID", "aevt", "odoc"]
open document/application, Bring target application to foreground

Now whenever you need to see an updated organization chart, all you have to do is run the Export to ClarisImpact script in FileMaker Pro 3.0.

It keeps growing and growing
In only a short time, Gold Blooms has gone from a single shop to a growing enterprise. Not even Mary knows the shape her company will take in a few years. She does know that she can count on ClarisImpact 2.0 and FileMaker Pro 3.0 to meet the changing needs of her small business, no matter how the business climate changes.

Troubleshooting the Unhandled Exception Error in Module WIN32SCOMB.DLL or APPSETUP.EXE in Claris Impact 1.0 for Windows

Win32s may cause a Unhandled Exception Error in ClarisImpact 1.0 for Windows

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

The version of Win32s that ships with ClarisImpact may not be compatible with some systems running Windows 3.1. You may experience an Unhandled Exception Error in Module WIN32SCOMB.DLL or APPSETUP.EXE when installing Claris Impact 1.0 for Windows. This error usually occurs after Win32s has been installed and appears to be operating successfully.

Try the following steps:
1] Remove the version of Win32s that was installed on your system by ClarisImpact.
2] Install the Newest version of Win32s (Currently version 1.30C) on your system
3] Reinstall ClarisImpact

Work In Style With ClarisWorks 4.0

ClarisWorks 4.0 has a powerful new feature called styles that helps you design and produce powerful and professional looking documents.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

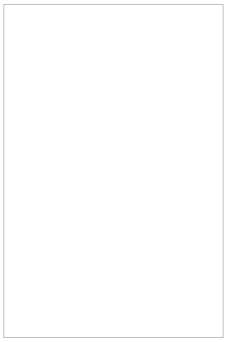
This article has been archived and is no longer updated by Apple.

Have you ever wondered if there was an easier way to format your documents without the hassle of changing everything line-by-line? Or perhaps you have slaved over designing a great spreadsheet table but now you forgot what you did to create it? With ClarisWorks 4.0 software and styles, you won't have worry anymore. Formatting all the paragraphs of a large document is only a mouse click away.

Styles are a series of attributes or formatting options applied to text, graphic objects, spreadsheet cells, database fields, or paint images. Styles are available in every type of ClarisWorks document except Communications. What makes styles so useful is that you can save a complex combination of formatting options in a single style and then use it over and over again with a single mouse click. ClarisWorks comes with a number of pre-defined styles. You can use any of these preset styles, modify them to suit your particular needs, or create your own styles. What's more, you can copy or import styles you create in one document for use in another file, or copy them to a disk to share with friends and colleagues.

The stylesheet palette

Each document has its own set of styles, called a "stylesheet," which is saved with the document. In ClarisWorks, a document's stylesheet is accessed through the stylesheet palette, which is the tool box for keeping your styles in order. The palette breaks out each style by category and sub-styles. To view the palette, choose Show Styles from the View menu on a Macintosh computer, or the Window menu on Windows (Figure 1).



Paragraph and outline styles can also be applied from the styles pop-up menu in the ruler bar. Like all the other palettes in ClarisWorks, the stylesheet palette can be moved easily around your document window by clicking and dragging on the palette's title bar. When you are not actively using the stylesheet palette, you can also collapse it and dock it in the upper-right corner of your document window by clicking the control box on the right hand side of the palette's title bar. There are four categories in which you can set up your formatting preferences:

Basic styles

These contain the attributes of objects such as fill color and pattern; pen width, color, and pattern; and text character formatting options such as font, size, style (bold, italics, and so on.), and text color.

Paragraph styles

These control the formatting that applies to entire paragraphs of text, including line spacing, space before and after paragraphs, text alignment, first line and paragraph indents, and tab spacing and fill options. What is less obvious about Paragraph styles is that they are also used to control certain aspects of spreadsheet cells and database fields (such as text alignment and line spacing). For added power, paragraph styles can also contain basic styles. This enables you to apply both paragraph and character-based formatting with a single style.

Outline styles

Similar to paragraph styles, they contain options particular to outlines in word processing documents or text frames. Specifically, these styles contain substyles that apply to each level of the outline and can be designed or edited separately.

Table styles

Only used to format a range of spreadsheet cells, table styles also contain substyles that govern the formatting of the various rows and columns of the cell range. Each substyle of a table style contains a basic style, as discussed above, to control such things as alignment, number formatting, and cell shading.

You can readily identify style categories by looking at the symbol to the right of a style in the palette. To see more information for a given style, click the Edit button on the lower-right of the palette. When you are editing styles, the palette name changes to Edit Style and will expand to show the list of properties contained in the selected style. At this point, you can also click on the Edit menu in the palette to select the option to show a sample of the selected style (Figure 2). In editing mode, the style categories have a triangle icon next to them. Clicking on these icons expands or collapse to show or hide all of the styles under a particular category.

Styles and documents

The stylesheet palette keeps track of what type of document you are working in, such as Word Processing or Spreadsheet. This applies to the type of document or active frame. This integrated palette is a very powerful tool, but it can also be confusing if you are not fully aware of how it works. It is a good idea to take a moment to become familiar and experiment with the stylesheet palette before using it in your everyday work. The following exercise is a good way to do this.

Exercise

Start with a new Drawing document and add a few elements to it, one at a time. First, use the text tool to create a text frame and type a few words into it. While the cursor is blinking within your frame, open the stylesheet palette. You will see the built-in paragraph and outline styles that are stored in all new ClarisWorks files by default. Next, select the spreadsheet tool and drag out a small spreadsheet frame (a few rows and columns should be fine). Notice that the stylesheet palette now contains the Default SS Basic style, the Default Paragraph style, and seven pre-defined table styles, and that the text-based styles listed previously are no longer available. Now create a small rectangle and observe that only the Default Paragraph style is accessible. Lastly, click the selection arrow and try single- and double-clicking on the frames and objects you have created. You will see that the stylesheet palette responds to the type of frame selected and displays the same options

There are two exceptions to whether you single-click to select the frame or double-click within the frame to make it the active item in the document. If you apply a style while the frame is selected, the entire contents of the frame are formatted according to that style, while applying it within the frame lets you select just that portion of the frame contents to which you wish to apply a particular style.

Some special considerations arise when using styles in the Database and Paint documents. In database files, styles are most useful in Layout mode, where the stylesheet palette behaves as demonstrated in the previous exercise. As you would expect, styles applied to fields on a layout affect all of the records in the file when viewed in Browse mode. Styles can also be used in Browse or List mode, but this can sometimes lead to unexpected results. Styles applied in Browse mode only apply to whatever is selected. Also, data formatted in Browse mode retains the formatting applied and ignores a style change.

In List mode, if you click a column header to select the entire column before applying a style, the data appears to have the attributes of that style, but reverts to its previous state when viewed in Browse mode. However, if you select a row heading to select an entire record, an applied style behaves in the same manner as styles applied to data in Browse mode. The same is also true for any individual cell or field to which you apply a style in List Mode. Because of the inconsistencies which can result from this approach, you should exercise caution when formatting database documents in Browse or List modes.

Because the Paint document has no pre-defined styles, the use of styles here is not as extensive as in other document types. If you are using a paint frame, you can use styles to change the pen color, pattern and width, and the fill color and pattern of the entire frame.

If you make and select a style before you begin using a paint tool, the images will have the pen and fill attributes of that style, but unlike in other documents, changing the options of the style later on will not affect anything previously created with that style.

Adding your own style

Once you have a solid understanding of styles, you are ready to start putting them to use. If the style already exists, applying it is as simple as selecting whatever you want the style applied to and clicking on the style name in the stylesheet palette. Keep in mind that you cannot apply a style if the palette is in Edit Style mode (Figure 3). If your palette is in this state, finish any editing you are in the middle of and click the Done button in the palette before attempting to apply a style.

As mentioned earlier, you can also apply paragraph and outline styles from the ruler bar, though basic and table styles must be accessed through the palette. Since paragraph and outline styles are paragraph-based they will be applied to the entire paragraph which contains your selection, even if you have selected only a portion of the text within a paragraph. This is true even if the style you are applying has only character-based formatting options.

It is common to see a "+" after a style name that has a check mark next to it. This plus sign indicates that the selection has had formatting attributes added (or deleted) manually, either before or after the style was applied. You may try to "erase" all previous formatting options by applying a second style and be surprised to find that the "+" is added at the end of this second style name as well. This is because character-based options that are applied manually, such as a font size change, always take precedence over a style which is applied.

For instance, if you format some text to have a text color of green, then subsequently apply a paragraph style which includes an option for red text, any other options of that style will be applied, but the text color will remain green and the plus sign will still appear after the style name.

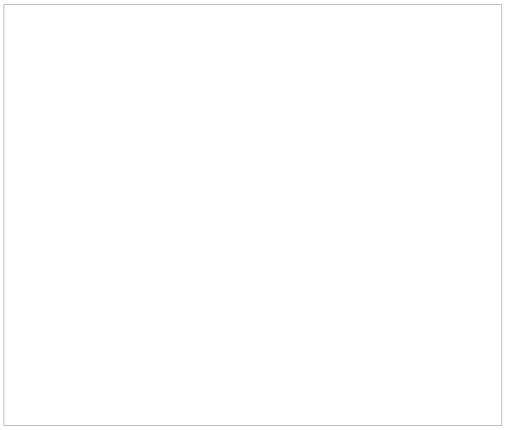
The real power and fun of styles comes from creating and using your own. You can save yourself a lot of time and frustration by designing styles for things you use repeatedly such as quotes, citations, bulleted lists, or recipe tables of ingredients and measurements. The use of styles also ensures a consistent look throughout your files.

Two ways to create a new style

If you have already applied a series of formatting options to a paragraph or group of cells, you can capture those settings in a style by selecting the desired text/object, clicking the New button in the stylesheet palette, and clicking the checkbox to "Inherit document selection format."

Give the style a descriptive name. For example, names based on the dominant formatting options like "Big Red Text" or "Chapter Title" work well. Make sure to choose the radio button that corresponds to the type of style you want to create. When you click OK, you see the style name in your newly customized stylesheet palette. Note that because you have not yet applied this style to the selection you used to create it, the palette still shows the check mark and the "+" on the style previously in effect. Although there is no visible change, it is good practice to go ahead and apply the new style to the selection.

You can also create styles from scratch. If you click OK in the New Style dialog box without choosing to inherit formatting from the selection, the insertion point changes to indicate that you are in style creation/editing mode (Figure 3). At this point, you can choose formatting options one at a time the same way you do when manually formatting by using tools, palettes, menu commands, and ruler controls. As you make your choices, you see them added to the style's list of properties. When you have chosen all of the desired options, click the Done button in the stylesheet palette. The properties list collapses, the pointer returns to its normal arrow shape, and you are ready to apply the style you just created.



When creating a style, you can also choose to have its attributes based on another style by using the Based on pop-up menu in the New Style dialog box. This is a good shortcut for creating a style which is very similar to a style which already exists in the current document. However, this feature should be used carefully because a style can have many properties.

Deleting a style

To delete a style, make sure you are in style editing mode, click the style name in the palette, and choose Clear Style from the palette's Edit menu. If you have designed a style to be based on another style, the later style depends on the first one for information on which formatting options to use. Because of this, you can't delete such a style without first deleting all styles which have been based on it. Many of the built-in styles cannot be removed from the palette, and neither can any custom style which has been applied anywhere in the file.

Changing existing styles

There are several ways to change existing styles. If you choose Modify Style from the palette's Edit menu, you can change a style's properties by changing the style on which it is based. You can also change the style's name and remove individual attributes from a style by clicking the desired property in the list, then choosing Clear Property or Cut Property from the palette's Edit menu. You can copy properties from one style to another by using the Copy Property and Paste Property commands. Lastly, you can add or change attributes by using any of the appropriate tools, palettes, menu commands, or ruler controls.

Sharing styles

Once you have taken the time to develop your own custom set of styles, you may want to reuse those styles in other files or have them available every time you create certain types of documents. If you have a single style that you want to use in another file, you can simply copy that style and paste it into the second file. To do this, open the file which contains the style, select the desired style from the stylesheet, and choose Copy Style from the stylesheet's Edit menu. Then, open the file in which you want to use the style and choose Paste Style from the palette's Edit menu. The pasted style appears in the palette and is stored with the second file when it is saved.

Exporting stylesheets

If you have a collection of styles which you wish to reuse, you will want to take advantage of the ability to export and import groups of styles between documents. When you choose Export Styles from the stylesheet palette's File menu, you see the Select styles to export dialog box.

TA43547_Work_In_Style_With_ClarisWorks_.pdf

All of the document's styles are available to export, including the pre-defined styles. All styles whose checkbox is checked are exported to a single styles file when you click OK. This enables you to export and reuse any of the pre-defined styles which you modified in the current document. By default, ClarisWorks saves all stylesheets to the Styles folder inside the ClarisWorks 4.0 folder.

After you choose Import Styles from the stylesheet palette's File menu, you are prompted to choose which style-sheet in the Styles folder you want to open. After you choose a stylesheet, the Select styles to import dialog box shows all of the individual styles saved in that stylesheet. You can choose just the styles you want to use in the present file.

Final thoughts on styles

A last helpful tip to leave you with lies in using the on screen Help system. For more specific information on styles, choose Index from the Help menu in Windows, or the Guide menu, represented as the question mark menu icon, on a Macintosh. Scroll down to the key word "Styles." With the extensive on screen Help system you'll have all the information you need to fully take advantage of styles. With the power of styles by your side, it should be much easier to create your own stylish documents.

ClarisWorks Products Which Support World Script I

Word processing products which currently support World Script I, allowing them to work with Hebrew and Arabic.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

NisusWriter by Nisus Software, Inc. and WorldWrite by WorldSoft Corporation support World Script I, allowing them to work with Hebrew, Arabic and other languages which are entered from right to left. ClarisWorks Hebrew and ClarisWorks Arabic are not available in the United States. The U.S. version of ClarisWorks supports only WorldScript II, which allows it to work with Japanese, Chinese (both simplified and traditional) and Cyrillic. The U.S. version does not support WorldScript I, therefore it cannot work with right-to-left languages such as Hebrew or Arabic.

Serial NB Card, MacDTF, and MacAPPC

1) Can the Serial NB Card communicate with an IBM mainframe over a 4800-baud modem to CICS?

2) Can MacAPPC run over SDLC this way?

This article has been archived and is no longer updated by Apple.
1) Yes, via MacDFT 1.1 with the Serial NB Card, running SNA/SDLC.

2) Yes, MacAPPC 1.1 can communicate with other LU6.2 devices serially or over Token Ring (Serial NB or TokenTalk NB card, respectively). It is also capable of distributing these sessions from the server machine to other AppleTalk network system nodes using ADSP on LocalTalk, TokenTalk, or EtherTalk.

How to Enable Your Macintosh Computer to Speak

The ClarisWorks Text-to-Speech shortcut and the FileMaker Pro Speak script command require the PlainTalk system software extensions.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The ClarisWorks Text-to-Speech shortcut and the FileMaker ProSpeak script command require the PlainTalk system software extensions. This software can be found on the System 7.5.3 CD (in the CD extras folder), or available from Apple Computer.

When you arrive at this location download the English Text-to-Speech file.

Technical details:

The software that enables your computer to speak has these components:
- Speech Manager, a system extension;
- one or more of these English speech synthesizers, depending on your hardware
and software:
- MacinTalk 2 for standard-quality speech,
- MacinTalk 3 for high-quality speech,
- MacinTalk Pro for highest-quality speech.

- several voice files, each identified with one particular synthesizer;

- the Speech control panel (if you have system software 7.0 or later).

The Installer installs the files that are appropriate for your system.

- If you have version 6.0.7 or 6.0.8 of system software on any Macintosh, these files are
installed.
- Speech Manager, in the System Folder;
- MacinTalk 2, in the System Folder;
- 9 voices, in the Voices folder, which is in the System Folder.

- If you have version 7.0 or later of system software on a Power Macintosh or on a Macintosh with a 68040 processor, the following files are installed.
- Speech Manager, in the Extensions folder;
- the Speech control panel, in the Control Panels folder;
- MacinTalk 3 and MacinTalk Pro, in the Extensions folder;
- 19 MacinTalk 3 voices, in the Voices folder, which is in the Extensions folder;
- 3 MacinTalk Pro voices (Agnes, Bruce, and Victoria), also in the Voices folder.

- If you have version 7.0 or later of system software on a Macintosh with a 33 MHz or faster 68030 processor, the following files are installed.
- Speech Manager, in the Extensions folder;
- the Speech control panel, in the Control Panels folder;
- MacinTalk 3, in the Extensions folder;
- 19 voices, in the Voices folder, which is in the Extensions folder.

- If you have version 7.0 or later of system software on any other computer, the following files are installed.
- Speech Manager, in the Extensions folder;
- the Speech control panel, in the Control Panels folder;
(Note: On Macintosh SE computers, the Speech control panel requires version 7.1
or later of the system software)
- MacinTalk 2, in the Extensions folder;
- 9 voices, in the Voices folder, which is in the Extensions folder.

Troubleshooting (issues and solutions):

- My Macintosh won't speak.
- Turn up the speaker volume in the Sound control panel.
- Choose a voice that requires less random-access memory. The voices Agnes, Bruce,
and Victoria take the most memory.

- The Installer program says there's a issue with the hard disk.

- Reinstall your system software, then try installing the English text-to-speech software again.

- The Installer program displays other error messages.
- Make sure you restart the computer with extensions off, as described in Installing the Software, above.

- I had an older version of text-to-speech software, then did a custom installation of the new software, but some of my older voices disappeared.
- The custom installation you chose erased the older version of the software that can use those voices. You can install newer versions of the voices by doing another custom installation of the new software to install MacinTalk 2 or MacinTalk 3 whichever you used to have. (If you're not sure which you had, you can install both.)

ClarisWorks: Issues Using AppleScript to Save with XTND Translator

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There are a few issues that can occur when using AppleScript to save ClarisWorks 4.0 documents with an XTND Translator. For instance, if you wanted to save the active Word Processing document with the MacWrite 5.0 XTND translator you would use the following script:

```
tell application "ClarisWorks"
activate
save document 1 in "MyFile" using "MacWrite 5.0"
end tell
```

If the XTND translator is not spelled exactly as it appears in the Save As dialog popup menu then the XTND translator will not be used. The XTND translator files contained within the Claris folder on the hard disk are not always named the same as what appears in the Save As dialog. For example, the translator in the Claris folder is named "Microsoft Excel 3-4" but appears as two translators in the Save As dialog.

In addition, the XTND translator may be ignored if capitalization is incorrect. For instance, "MacWrite II" needs to be spelled with a capital "M" and a capital "W".

ClarisWorks: Creating Return Address Labels

Use the power of the ClarisWorks database to easily create return address labels by placing this information directly on the label layout.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Printing multiple copies of a name and address in a database won't normally print on all the labels on a label sheet. The printer will usually try to print each name and address on a separate page. Here's a workaround that will let you print multiple copies of a name and address, such as for a return address, using all the labels on a sheet.

The secret is to put the return address information directly on the label layout, and then create the appropriate number of "blank" records for a single sheet of labels. When you print the blank records, you'll be printing the return address that is on the layout.

1. Create a new database, called "Return Address Labels." It is best to do this in a new database file. This way you do not add blank records to your main database.

2. Define a single field, of type Text. Name it "Place holder."

3 From the Layout menu, select New Layout.

4. From the New Layout dialog box, select Labels. Choose the appropriate Avery label number for the labels you plan to use. For this example, we will assume the Avery 5160, which come 30 to a sheet, in three columns of ten.

5. In the Specify Field Order dialog box, choose the Place holder field and move it over to the right. Click OK.

6. From the Layout menu, select Layout. This will bring you into Layout mode, which will let you edit the label layout you have just created.

7. Click on the Place holder field. Press the Delete key to delete the field.

8. Click on the Text tool (the letter "A") and draw a text box in the label area. Do not move the small box with the word Body in it; draw on top of this box if necessary. (Moving this box will change the size of each label on the sheet.)

9. Type your return address information within this text box.

10. From the Layout menu, select Browse. We now need to create 30 records to correspond with the 30 labels on a sheet of Avery 5160s. (For other labels, create the number of records equal to the number of labels on a single sheet). In Browse, hold down the Apple key (*) and hit the letter "R" (*+R) in Windows use the Ctrl key and the letter "R" (Ctrl+R). This will create a new record. The idea is to create 30 blank records (one for each label). Keep creating new records until the Records indicator in the Status Area (the bar on the left side of the screen) reaches 30.

To print your return address labels, select Browse from the Layout menu, then choose Print from the File menu.

If you want to print more than one sheet of labels, use the Print dialog box to specify the number of copies desired.

A/UX: How to Partition for Two 45MB Cartridges

In our office, we use 45MB removable cartridges as standards for hard disk storage. Some of us now want to use A/UX. Is it feasible to put A/UX on two separate 45MB cartridges and run it as is? If yes, what partitioning would you recommend?

This article has been archived and is no longer updated by Apple.
If you have two 45MB cartridge drives on a Macintosh running A/UX, it may be possible to separate the standard A/UX Root&Usr partition into Root and Usr partitions on two different drives. Here is the list of disk partitions and their sizes from the standard A/UX 2.0b for an 80MB drive:

```
Approx. size Partition
------------ ---------
16K Macintosh Driver
16K Free
54567K A/UX Root&Usr (slice 0)
18432K A/UX Swap (slice 1)
3072K A/UX Autorecovery
2048K MacPartition
1K Free A/UX (slice 3)
1K Free
```

For this particular situation, we would suggest that you put the "Macintosh Driver", the "A/UX Root"(/), the "A/UX Swap", and the "MacPartition" partitions on one drive, and put the "Usr"(/usr) partition on another drive. You may remove the "A/UX Autorecovery" partition if you have a way to recover from any disk disaster.

The total size of the "Macintosh Driver" (16K), the "A/UX Swap" (18432K), and the "MacPartition" (2048K) partitions is 20496K. Therefore, you can create the "Root" (/) file system with the size of about 45MB - 20496K. Note that the current disk space occupied by the "Root" file system (excluding /usr) is about 20MB. Therefore, you have about 5MB of space for growing in the "root" drive. The entire disk size (in blocks) can be found from the report of "dp /dev/rdsk/cXd0s31" (X is the SCSI ID of the drive).

Use the "dp" command to create the above partition names and sizes in one drive. Within "dp", write down the size (in block) of the "Root" (/) file system for later "newfs" use.

On the other drive, you can allocate the entire 45MB for the "Usr" (/usr) partition. Use the same "dp" to create the "Usr" (/usr) partition, and write down its size. Note that the current disk space occupied by the "Usr" (/usr) is about 18MB. Therefore, you have about 25MB (maybe less due to 5 percent "low-water-mark" required on BSD UFS) space to grow.

To balance the disk space between the two drives, you can "symbolically" link some files or directories from the "Root" drive to the "Usr" drive.

To make a "Root" (/) Berkeley file system (UFS) do:

```
# newfs -s number-of-blocks-for-root /dev/dsk/cXd0s0
```

"X" is the SCSI ID of the 45MB "Root" drive.

To make a "Usr" (/usr) Berkeley file system (UFS) do:

```
# pname -cY -s2 "Usr"
==> /dev/dsk/cYd0s2
```

"Y" is the SCSI ID of the 45MB "Usr" drive, and assume "Usr" is the partition name created in the drive.

newfs -s number-of-blocks-for-usr /dev/dsk/cYd0s2

After you have these file systems created, you can mount the above two file systems. Here is an example:

mount /dev/dsk/cXd0d0 /45root
mount /dev/dsk/cYd0s2 /45usr

After mounting the file systems, you can use either "cpio" or "tar" to copy the following files and directories (exclude /usr) onto the 45MB "Root" drive:

/.[a-z]*
/[a-t]*
/[v-z]*
/[A-Z]*

and copy the following /usr directory onto the 45MB "Usr" drive:

/usr

ClarisWorks: Maximum Rows and Columns (SS)

What is the maximum number of rows down and columns across on a ClarisWorks spreadsheet?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The maximum number of rows down is 16,384 on a ClarisWorks spreadsheet. The maximum number of columns across is 256. This is a total maximum of 4,194,304 cells.

To change this, select Document from the Format Menu and then change the numbers in Columns and Rows under Size.
Published Date: Feb 18, 2012

ClarisWorks: Saving Only Selected Fields and Records of a Database to Another File Format

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In ClarisWorks, if you use the Save As command to save a database in another file format, the resulting file will contain data from only the found (visible) set of records. Because of this, you can limit which records are saved by performing a Find prior to using Save As. However, if you use Save As, the resulting file will always contain the data from every field in the found set of records.

If you want to limit which fields are used in the "export" file, the trick is to use Copy and Paste instead of Save As. Perform the following steps:

1. Create a layout in the database which has only the fields which you want to "export" and make it the current layout.

2. If appropriate, perform a Find so that only the desired records are visible.

3. Press the Enter key (on the far right of your keyboard, in the numeric keypad) to ensure that no individual record or field is selected or active.

4. Choose Select All from the Edit menu (Command-A on Mac, Ctrl A on Windows).

5. Choose Copy from the Edit menu (Command-C on Mac, Ctrl C on Windows).

6. Create a new, blank Spreadsheet document (Command-N, down arrow 3 times, then press Return on Mac; Ctrl N, down arrow 3 times, then press Enter on Windows).

7. Choose Paste from the Edit menu (Command-V on Mac, Ctrl V on Windows). At this point, you will have an Untitled ClarisWorks spreadsheet document which contains only the desired data.

8. Choose Save from the File menu (Command-S on Mac, Ctrl S on Windows), select the desired format, name the file, choose the desired location for the file to be saved to, and press Return (Mac) or Enter (Windows), and there you have it.

If you want this data in a format not available for spreadsheets (e.g. WordPerfect or Microsoft Word), in step 6, create a new word processing document instead of a spreadsheet and then follow steps 7 and 8. This will result in a text file with the data in tab separated format. If you want the data in comma separated format, use the Find/Change command to replace the tabs with commas before proceeding to step 8.

All or much of this process can be automated with a macro as well.

ClarisDraw: Showing Line Lengths In Feet and Inches When Using Autosize Lines

How to use the ruler to show feet and inches, rather than the default feet and fractions of feet when using autosize lines.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
When using Autosize lines to display the lengths of lines, if the line is scaled so that one inch represents one foot, the default display format is in feet and fractions of feet (for example, the default display for 6' 3" would be 6 1/4', while the default fraction-as-decimal display for 6' - 3 11/16" would be 6.6875').

To show the result in feet and inches (i.e. 6' 3" or 6' 3-11/16"), the Divisions in the Ruler dialog box must be set to a multiple of the number of standard divisions of both inches (i.e. 16) and feet (12), or 192. Perhaps the best way to do this is to set the scale at .25 inches to 1 foot, and set the number of divisions to 48.

See the online help under Autosize Line for instructions on implementing ruler changes for existing lines.

Can‘t Donate, Sell or, Transfer Old Software After Purchasing Upgrade

The Claris software license agreement stipulates that you may not donate, sell, or transfer the old version of your software after purchasing an upgrade.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The Claris software license agreement stipulates that you may not donate, sell, or transfer the old version of your software after purchasing an upgrade. Although the new version may come with a new serial number, the owner still only has one software license.

The exact legal specifics from the Software License agreement read:
1.License
(d) Notwithstanding any other terms in this License, if the Software is licensed as an Upgrade or Update, then you may only use the Software to replace previously validly licensed versions of the same software. You agree that the upgrade or update does not constitute the granting of a second license to the Software (i.e., you may not use the upgrade or update in addition to the software it is replacing, nor may you transfer the software which is replaced to a third party).

ClarisDraw for Windows 1.0: Import/Export Formats

Import/Export formats for ClarisDraw for Windows 1.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The file formats that ClarisDraw for Windows 1.0 supports include:

Importing:

ClarisImpact 1.0 presentation and draw Documents
ClarisWorks Draw Documents (*.CWK)
Computer graphics metafile (*.CGM)
DIB-bitmap (*.DIB, *.BMP, *.RLE)
Encapsulated Postscript file preview (*.EPS)
EPS file TIFF preview (*.EPS)
MacDraw Pro (*.MDP)
Macintosh picture file (*.PCT)
MacPaint (*.MAC)
Microsoft video (*.AVI)
Microsoft Windows metafile (*.WMF)
DOS Text (*.TXT)
Rich Text Format (*.RTF)
Microsoft Word for Windows 2.0 & 6.0 (*.DOC)
Tagged image file format (*.TIF)
WordPerfect 5.1 & 6.0
ZSoft Paintbrush files (*.PCX, *.PCC)

Exporting:

Macintosh picture file (*.PCT)
Computer graphics metafile (*.CGM)
Microsoft Windows metafile (*.WMF)

Note: This information can also be found on the on-line help that comes installed with ClarisDraw for Windows.

A/UX: Questions and Answers (11/95)

This article contains frequently asked questions (FAQ) about A/UX?

This article has been archived and is no longer updated by Apple.

Question: A/UX supports the Comm Toolbox. Can I drag tools from Mac OS and use them with A/UX, or must they be special versions?

Answer: If the tool uses a low-level communication protocol that A/UX supports (for example, serial, MacTCP), there is a good chance that the tool will work under A/UX. However, if the tool uses something unsupported, such as DECnet, it will not function properly under A/UX.

Question: MacTCP works on A/UX. Is it the same as on Macintosh OS, a special version, or a switch toward "native TCP/IP on A/UX"?

Answer: The MacTCP on A/UX is a special version of MacTCP for A/UX. The Macintosh OS version of MacTCP lets a non-Ethernet-based Macintosh run IP-based communications programs over LocalTalk by encapsulating IP packets into DDP packets. The A/UX version of MacTCP does not support this option.

Question: MacX works on A/UX. Is it the same as on Macintosh OS, and in this case, is the "MacTCP tool" in the Comm Toolbox the same as on Macintosh OS?

Answer: The MacX server under A/UX is identical to the MacX under Macintosh OS. So is the "MacTCP Tool" in the A/UX Extensions folder. If you intend to use a version other than that supplied with A/UX, refer to the MacX User's Guide for correct installation instructions.

Question: Does "X Window System native" work only in the Console Emulator session type, or does it work with other sessions types?

Answer: The "Native X11 Window System" can work only in the "Console Emulator" session type under A/UX.

Question: Why is UFS quicker than SVFS?

Answer: According to the original implementors of Berkeley Fast File System (UFS), the UFS provides up to ten times the file access rate of the traditional UNIX file system (SVFS). The performance enhancements include better locality of reference in the file system structures and support for large block sizes. In addition, the BSD UFS provides support for file-locking, symbolic links, "long" file names, 32-bit inodes, and resource quotas. In A/UX, however, A/UX UFS does not support resource quotas.

Question: What are the main improvements of X11R4 compared with X11R3?

Answer: In general, compared to X11R3, the code of X11R4 is smaller, and the performance of X11R4 is faster. It also provides a variety of bug fixes in X11R3.

Question: What is the Xaw Athena Widget Set?

Answer: The Xaw Athena Widget Set is a set of user interface components known as widgets, including scroll bars, menus, and buttons, and so on. The Xaw Athena Widget Set is included in the standard X11 distribution. In A/UX Native X Window System, the /usr/lib/libXaw.a library is the Xaw Anthena Widget Set.

Question: How does A/UX manage an A/UX Toolbox application, compared with the MultiFinder Toolbox, which is not "re-entrant"? Are all managed by the startmac process?

Answer: It is managed by the UI (User Interface) device driver and the MF (MultiFinder) under A/UX. Note that MultiFinder under A/UX follows the Macintosh paradigm for cooperative tasks and does NOT create a new or different one from the Macintosh.

Question: When an application uses the Toolbox, the calls are trapped (GetFile is changed in open or fopen, for instance). Is it the same for A/UX and Macintosh OS applications?

Answer: Yes, A/UX performs the same as it does under Macintosh OS. Toolbox applications share the same address space with Macintosh applications in that they have access to the application and system heaps, low-memory globals, and so on.

Question: Do communications cards, like Serial NB and others, work under A/UX?

Answer: It seems that the Apple Serial NB Card does not have a driver for A/UX yet. We would think both the AST-ICP card and the SuperMac Comm card should continue to work under A/UX.

Question: Is there an implementation of Open Look on A/UX?

Answer: Neither Tech.Comm nor A/UX Engineering knows of a port of AT&T Open Look for A/UX.

Question: Can MacX on A/UX manage several screens?

Answer: MacX server under A/UX supports only one screen (display). It does the same as under Macintosh OS.

ClarisWorks: Single Quote or Accent Mark in Field Name Hinders Label Assistant from Making Field

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If the single quote or accent mark is used in a field name the ClarisWorks Label Assistant cannot create a calculation field equal to the original field, thus hindering the assistant from accurately creating the field.

The only way to get around this issue is to change the field name so it does not use the single quote or accent mark.

Third Party Translators to Convert to DXF

This article lists two third party CAD mover packages that will convert files to DXF and other formats

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

PowerDraw Translator

System Requirements: Macintosh Classic or larger; hard disk drive; drawing software.

PowerDraw Translator from Engineered Software converts drawings between PowerDraw, Illustrator88/EPS, PICT, PICT II and DXF file formats into fully editable drawings. It also gives users the capability to read previous versions of PowerDraw, Clipboard/Scrapbook, MacDraw, Claris CAD, Library and HPGL file formats. External versions are available for PowerDraw 4.0 or later users and PowerCADD 1.0. Suggested retail price is $275 retail; stand-alone version $249 retail; external version.

CADMover 4.0

System Requirements: Macintosh or Power Macintosh.

CADMover from Kandu Software Corp. enables users to get their two- and three-dimensional graphics where they need to be: across departments, computer platforms or programs. Users can create synergy via 3DGF, Adobe Illustrator, Architron II, CGM, Claris Cad, DDES2/IT8.6, Dimensions, Dreams, DXF (both text and binary), ENVISAGE 3D, Gerber Plotter, HPGL, Focus, Zoom, IGES, MacDraft, MacDraw II, MiniCad+ Text, PICT, Presenter Professional, Sculpt 3D, STL (stereolithography), Super 3D Text and Wavefront (.OBJ). CADMover's precision transformation logic maintains a high degree of accuracy for all calculations. Translation options include multiple layers and levels, multiple drawings within a file, scaling between most formats, unlimited file size with use of hard disk and full color. CADMover 4.0 has pan and zoom for accuracy checks, new editing dialogs and six new EPSF readers. Suggested retail price is $495 retail.

ClarisWorks for Windows: Removing List of Recently Opened Files

This article will assist you when removing unwanted files from the list of recently opened files for ClarisWorks for Windows.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
This is an update to an existing article.

When opening up files in ClarisWorks, ClarisWorks keeps a running list of the last four files that were opened and displays those file names at the bottom of the File menu. This information is updated each time a new file is opened, and the most recent file appears at the top of the list while all other names are booted down on the list with the one at the bottom moving completely off the list.

If you delete a file from your hard disk using the File Manager in Windows, the name does not disappear from the list. It will only disappear from the list after opening four other documents (if it was the first on the list when the file was deleted).

CLARISWORKS 3.x

In order to clear these files off the bottom of the file menu (without opening four documents), you need to edit the CLARIS.INI file. When you edit the CLARIS.INI file, in the ClarisWorks 3.0 section you will see lines that read:

LRUfile0=c:\\<path>\\<Filename.EXT>
LRUfile1=c:\\<path>\\<Filename.EXT>
LRUfile2=c:\\<path>\\<Filename.EXT>

If you delete these LRUfile<x> lines, it will remove the files from the File menu list. As you open new files, they will come up in the listing under the File menu.

CLARISWORKS 4.x

In order to clear these files off the bottom of the file menu (without opening four documents), you need to edit the Windows 95 System Registry.

PLEASE NOTE: The central information database for Windows 95 is called the Registry. Due to the importance of this file, great care must be taken when editing / modifying this file. It is recommended that only experienced users attempt to edit the Registry. It is also advisable to backup the Registry database before making changes. The Registry can be saved (exported) in text format as a .REG file by using the Registry Editor (REGEDIT.EXE). The Registry can later be restored (if necessary) by importing a .REG file that was created by exporting the Registry. Please consult your Windows 95 documentation for more information on the Registry Editor and backing up its contents. Please do not attempt the following Registry edits if you are not comfortable.

1. Click on the START button on the Windows 95 Task Bar and choose RUN.
2. In the OPEN dialog box, type in REGEDIT and click on OK.
3. In the REGISTRY EDITOR, double click on HKEY_CURRENT_USER
4. Under HKEY_CURRENT_USER, double click on the folder entitled SOFTWARE
5. Under SOFTWARE, double click on the folder entitled CLARIS CORP.
6. Under CLARIS CORP., double click on the folder entitled CLARISWORKS FOR WINDOWS
7. Under CLARISWORKS FOR WINDOWS, double click on the folder entitled CLARISWORKS 4.0

On the right hand side of the screen you should see several lines of data. Locate the lines that look similar to the ones below.

LRUfile0
LRUfile1
LRUfile2

If you delete these LRUfile<x> lines, it will remove the files from the File menu list. To do so, right click on the ones you want to delete and select DELETE from the pop-up menu. Make sure that you do not delete anything else but the lines that start with LRU. Once the edits have been made, close the Registry and relaunch ClarisWorks 4.x.

ClarisDraw: Grouped Objects Rotated 90 Degrees Disappears

Objects will seem to disappear in certain cases when grouped, then Rotated 90 degrees.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
An issue occurs in Claris Draw for Windows in certain cases, when you group objects then choose Transform.. Rotate 90 degrees, under the Arrange Menu.

Issue: The objects seem to disappear, however, they are still there, on another part of the page.

Workaround:
1. Choose Show Object Info, under the View menu.
2. Select & Group your objects.
3. Select Transform... Rotate 90 degrees, under the Arrange menu
4. If the object seems to disappear, look at the Show Object Info box. One of the numbers may show a negative number. Change that to a positive number and your Rotated and Grouped object will reappear.

Lastly, Ungroup the objects, rotate them and then regroup them.

WorldScript Update 1.1- Read Me

This article contains the Read Me file for the WorldScript Update v1.1.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Who Should Install WorldScript?

This installer will install files needed by WorldScript technology for users running Mac OS 7.5 and above. Users of the Japanese and Chinese Language Kits or applications which depend on WorldScript technology should install these pieces as they improve the stability and performance of your system.

QuickDraw GX and Power Macintosh users should upgrade to these pieces as they provide important improvements over previous versions.

The files in this WorldScript updater are taken from the Arabic Language Kit 1.0.1, Hebrew Language Kit 1.0.1 and the Cyrillic Language Kit 1.0. You do not need this if you are running one of these kits and do not simultaneously have Japanese or Chinese installed.

What's new in the WorldScript Updater 1.1 over WorldScript Updater 1.0.1?

1. It updates the Language Kit Extension to 7.5.2 when it is present and not otherwise. In previous versions of the WorldScript Updaters, the Language Kit Extension was left untouched.

2. WorldScript I is version 7.5.3. Improvements since 7.5.1 include fixing a conflict with ATM, fixing a crash with LC 475, Performa 57x, and Duo 280c CPUs, allowing Setting control panels (Arabic, Hebrew, Persian) to work better as secondary scripts and some minor improvements to WorldScript I script resources.

3. The WorldScript Updater 1.1 installer script recognizes name differences by doing a more intelligent search and thus will now work with localized file names.

4. It recognizes the difference between WorldScript Power Adapter and WorldScript II which at one point had the same type and creator.

5. It prevents installation of the Language Kit Extension on systems where it does not already exist.

6. It updates InputBackSupport even when WorldScript II doesn't need to be updated.

7. Naming is now more consistent. "WorldScript Pieces", "WorldScript Pieces Installer", "WorldScript Updater", "WorldScript Installer", 7.5.1, 1.0, have all been changed so that it is consistently called "WorldScript Updater 1.1."

About the WorldScript Updater

The WorldScript Installer installs the following files:

* WorldScript I (version 7.5.3) used for complex one-byte processing of languages such as Arabic and Hebrew,

* WorldScript II (version 7.5.1) used for two-byte processing of languages such as Chinese, Japanese, and Korean,

* InputBackSupport (version 7.5.3) provides support for two-byte fonts; automatically installed with WorldScript II,

* Language Kit Extension (version 7.5.2) provides essential support for all Language Kit products. This extension cannot be custom installed. It will be automatically installed on all systems where it is necessary.

Using the WorldScript Updater

The Easy Install option of the WorldScript Updater 1.1 updates your existing WorldScript and/or Language Kit Extension files. If you want to install additional files, you can use the Custom Install option of the Installer. The Language Kit Extension will only be available as an update. In other words, you cannot install this unless you have purchased an Apple Language Kit and have it installed in your active system.

1. To open the WorldScript Updater, double-click the Installer icon on the disk you received with your WorldScript Updater package.

2. To update existing WorldScript and Language Kit Extension files on your startup hard disk, click Install.

To install additional files, choose Custom Install from the pop-up menu, then click to put an X in the box next to each item you want to install. When you're finished choosing items, click Install.

TA43567_WorldScript_Update_Read_Me.pdf

The files are installed on your hard disk. You may be prompted to restart your computer after installation.

ClarisWorks: Converting Comma Separated Text (ASCII) Files to Tab Separated Text

ClarisWorks does not import comma separated text files into the database or spreadsheet. You can convert a comma separated text file to a tab separated text file by doing the following steps.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Open the text file as a Word Processing document. (Select Word Processing as document type.)

Choose Find/Replace from the Edit menu.

Enter: "," (quote comma quote) in the Find box, and enter: \\t (the symbol for a tab) in the Change box. Click on Change All.

Now do one more Find/Replace, this time enter: " (quote) in the Find box, and enter a space in the Change box. Click on Change All.

Choose Save as... from the File menu for this document and save it as Text.

Now you have a tab separated text document. When you open this document as a Database (select Database as document type) it will create the fields and convert the data automatically.

This works great for data such as names and addresses, but can be a little tricky if you are importing fields with quotes or tabs contained in the text.

Using Bar Codes in Claris Databases

This brief covers the background, specifications, and usage considerations when using bar codes.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The different bar code types are intended for different applications, i.e., the Postnet is the one used by the U.S. Postal Service and it contains information (including the ZIP code) that allows them to sort letters mechanically.

The most widely used bar code is Code 39. Because it contains numbers, letters and some characters such as dash, dollar, slash, etc., it can be used with existing numbering systems.

The UPC (Universal Product Code) is the main system used by retail stores, but it contains ONLY numbers, and must have a fixed number of characters in it.

The Interleaved 2 of 5 is the system used for industrial purposes, and is the standard for shipping containers. The main advantage of this system is that it is very compact, thus making it suitable for use where space is limited.

Code 128 is the only code that has all 128 ASCII characters so the bar code can contain alpha, numeric, punctuation or special characters.

Printing bar codes may present a issue if you use an ink jet printer. The issue may arise if the bar code reader is intended to read "invisible light". There are two types of readers: visible light and invisible light readers. With invisible light readers, the reader "needs" a carbon content in the ink, which ink jet ink does not have. This means that the barcode will print nicely, but the reader will not read it. If you print something on an ink jet printer and the bar code reader cannot read it, try making a "Xerox" copy of the printed page and see if it reads, if it does, then you know that the issue is the printer ink.

A very important setting in ClarisWorks when using bar codes is the "Fractional Character Widths" in Text Preferences.

Bar codes cannot be compressed or reduced. This means you have to use the correct size font. This is why when you purchase a commercial bar code font it comes in various sizes.

ClarisImpact 2.0: Datasheet Text

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

ClarisImpact 2.0

ClarisImpact software lets you create more kinds of structured business diagrams than other programs, flowcharts, orgcharts, datacharts, calendars, network diagrams and much more. And they have never been so easy to create. Instead of building them one piece at a time, you simply select the diagram type you need and ClarisImpact creates your entire graphic instantly.

You will get exactly the look you want, thanks to six professionally - designed style families. Just choose the look you want and add it to your chart or diagram with a click of the mouse. Each is fine tuned to print beautifully in black and white or color. And combine style elements to create hundreds of custom looks. Either way, you can create the kinds of graphics that make you look good, without being a graphic designer.

What is more, with the DataDraw ª feature you can quickly turn data from your favorite spreadsheet or database file into an eye-catching ClarisImpact chart or diagram. When you are ready to communicate, use the built-in word processing and presentation capabilities to create a report or a slide show. In mixed platform environments ClarisImpact lets you trade files between your Windows and Macintosh computers without the need for translation.

ClarisImpact. Automatic charts, diagrams and more.

* Flow charts
* Organization charts
* Network diagrams
* Timelines
* Process diagrams
* Calendars
* Tables
* Outlines
* Schematic diagrams
* Total Quality Management charts
* Brainstorms
* Data charts and graphs
* Reports
* Presentations
* And more! For Windows , Macintosh , and Power Macintosh

All-In-One Business Graphics Solution

Complete Charting and Eliminate the need for multiple business graphics. Graphics Capabilities utilities. Each ClarisImpact tool has the capabilities found in dedicated applications.

Automatic Graphic Instantly create perfectly-aligned and proportioned Creation business graphics using any of 6 basic tools available in ClarisImpact.

Pre-defined Styles Create your own look or select from an extensive collection of professionally-designed styles to give all your business graphics a unified, professional presence.

Turn Spreadsheet and Automatically turn your spreadsheet and database. Database Files into Charts files into eye-catching charts with DataDraw, and ClarisImpact can be set to automatically update linked graphics whenever the original file is changed or modified.

Artistic Impact Personalize graphics down to the last detail using the integrated drawing tools and a clip art library with thousands of professionally-designed symbols, graphics and high-impact artwork, you simply drag and drop them into position.

Powerful Presentations Create powerful online presentations with over 50 transition effects, QuickTime or AVI movies, integrated outliner and speaker notes. Slide sorter lets you easily view and arrange an entire presentation . Built-in Word Processing With complete word processing capabilities, you can create professional-looking documents. Specify margins, columns, tabs, spacing, and more even use text wrap, footnotes, and spell checking.

Cross - Platform Share files instantly between Windows, Macintosh Compatibility and Power Macintosh computers without file translation

Connected Diagram Lets You Picture Any Process

Connectors Draw Simply point and click to chart the steps of any Automatically process flow, network, TQM, brainstorm, decision - tree, transportation and more resulting in a clean, crisp connected diagram that is easy to follow.

Standard Symbols Use ANSI-standard process and flow chart symbols and computer network symbols provided, or customize and create your own.

Connector Options Add emphasis to your diagram by applying different spacing, direction, or color to key connectors.

Organization Charts to Reflect Your Business Structure
Organization Chart Tools Enter names, titles and other relevant information to create professional-looking organization charts in seconds.

Fast Reorganization Reflect changes to your organization by simply adding and deleting boxes, or clicking and dragging from one location to another, connections and alignment are automatically updated.

Features / Benefits
Extensive Format Options Exercise complete format control, including orientation, distribution and spacing of management, peers, and subordinates.

Timeline and Calendar Models Manage Projects and Time
Standard Timeline Create Gantt charts or timelines to track project Features start and completion dates, durations, milestones, dependencies, critical paths, etc.

Timeline Task Simply click and drag to reorganize tasks, all data Reorganization and graphics adjust automatically.

Monthly or Yearly Create and combine calendars to notate events from Calendars personal travel to group meetings.

Unique Calendar Produce eye-catching calendars with day and text Design Options styles, like banners and symbols to show special days.

Data Chart and Table Models Compare Your Data
Multiple Data Chart Types Access a complete selection of data charts: bar, line, scatter, hi-lo, pie, pictograms, and more, 96 variations in all, even mix chart types in a single graph or add 3D and shadow effects.

Enliven Data Chart s Add new life to old, familiar charts using blends, gradients and a full set of drawing tools to make charts stand out.

Quick and Easy Turn comparative text and numeric data into Table Creation eye-catching tables. Customize grid lines, formatting and justification, even automatic cell width and height control . Advanced Table Calculation Now you can create tables that act just like spreadsheets, supporting industry - standard formulas and summations.

Row and Column Simply click and drag rows or columns to reorder Reordering data, and graphics adjust automatically.

Full Display Control Customize axes, legend, line styles and data display to emphasize information, even set numerical display for percent, decimal, currency and more.

Built-in Graphics Intelligence Always Available
Smart Graphics Automatically retain element alignment, spacing, and proportions when editing or scaling charts and graphics.

Smart Line Routing Maintain connections between elements, even when they move! Smart Connector [a] lines automatically route around other elements to ensure clear presentation.

Easy Editing Edit text and values directly on charts or through data tables for quick, clean revisions to your document. Edits are instantly reflected so your work is always current.

Outline Model Helps Organize and Present Ideas
Easy Outline Editing Change outline sequence by simply clicking and Features dragging text.

ClarisImpact . Now when you need great looking business graphics and you need them fast, there is ClarisImpact. With just a few clicks of your mouse, you can produce timelines, calendars, structured diagrams, data charts and much more. You can even transform your database and spreadsheet files into ClarisImpact charts or diagrams automatically, using its built-in DataDraw capabilities, without rekeying any data. Is not it about time you took the hassle out of creating graphics? With ClarisImpact, absolutely no drawing talent is required, but the results will make you look like a pro!

For Macintosh
File Formats Supported
* EPSF (import & export)
* TIFF (import)
* PICT and PICT2 (import & export)
* CGM (import & export)
* ClarisDraw, [a] MacDraw * II, MacDraw Pro(import & export)
* MacPaint * (import)

* .DOC - Word for DOS 5.x, Word for Windows 2.X, Word for Windows 6.x (import & export)
* .WPD, .DOC - WordPerfect 5.1, WordPerfect6.x (import & export)

Required Equipment

* PC with 386/25 MHz or higher processor
* One hard disk, one 3.5" floppy
* Microsoft Windows 3.1
* WIN32s (included)
* 8 MB RAM

Printer Support

* Hewlett-Packard LaserJet, PaintJet, DeskJet series
* Postscript printers such as Apple LaserWriter, IBM Laser Printers
* A wide variety of other Windows-compatible printers

Applesoft: Internal program storage format

Applesoft programs are stored one line at a time starting at memory location $801 and ascending in order by line number.

This article has been archived and is no longer updated by Apple.

Each line is stored in this format:

```
                          $8xx
00  01  02  03  04  05  06  07  08  09  0A  0B  0C  0D  0E

00  0D  08  0A  00  97  3A  BA  22  48  49  22  00  00  00
 E   LINK   LINE #   H   :   P   "   H   I   "   E   LINK
 O                   O       R                   O
 L                   M       I                   L
                     E       N
                             T
```

The first two bytes are pointers to the absolute address of the beginning of the next line. The first byte is the least significant.

The next two bytes are integers representing the line number of that line. Again, the first byte is the least significant.

The next byte, a token, stands for the first Applesoft keyword. When the lines starts with "A = 1", the variable name (in ASCII) is first. The remaining command consists of keywords and symbols reduced to one byte tokens and unmodified ASCII text.

A list of Applesoft's tokens appears on page 121 of the Applesoft Reference manual.

The subsequent bytes are either "$00"s signifying the end of this line, or "$3A"s, indicating multi-statement lines, followed by a "$00.

If the link field for a line is 00 00, then Applesoft considers it the last line in the program while running or listing. The SAVE command uses a different pointer for the end of the program. $AF,B0 normally points to the high byte in the line number of the line beyond the last line.

Creating a New SYSTEM.INI without any Third-Party Drivers

For in-depth troubleshooting purposes, you can create a clean SYSTEM.INI file using your original Windows diskettes

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The SYSTEM.INI file is a text file used my Windows to configure hardware and other device drivers to be used in Microsoft Windows. Overtime, installation of hardware devices and software applications can add to or modify the SYSTEM.INI file that might cause conflicts with other applications. Because of this it might be desired to create a clean version of the SYSTEM.INI file for troubleshooting purposes. Unlike the WIN.INI file, which you can rename and have Windows create a generic one for you, the SYSTEM.INI file must actually be rebuilt to reflect the hardware that is in your machine.

To create a new SYSTEM.INI file that is configured for your specific hardware but does not contain any references to third-party device drivers, do the following:

1. Rename the SYSTEM.INI to SYSTEM.BAK

2. Expand the file SYSTEM.SR_ from the original Windows diskettes to the Windows directory with the following command:

c:\\windows\\expand a:\\system.sr_ c:\\windows\\system.ini

NOTE: This file can be found on DISK1 of the Windows 3.1 1.44 megabyte 3.5 inch disk set or on DISK 2 of the 1.2 megabyte 5.25 inch disk set.

3. Change to the Windows drive, and then change to the Windows directory.

4. Type SETUP and press ENTER / RETURN to start the MS-DOS based Windows Setup. It is very important that this step is run when in your Windows directory (see STEP 3)

5. Select the correct hardware options for your system.

6. Accept the changes. At this point you can have SETUP copy new drivers if you want

7. Open the new SYSTEM.INI in a text editor and make the following changes:

- Add PROGRAM.EXE to the SHELL= line of the [Boot] section.

- Remove or remark out the TASKMAN= line in the [Boot] section.

- To enable 32-bit disk access, add the following lines to the [386Enh] section:

32BitDiskAccess=<Boolean>
device=*int13
device=*wdctrl

Replace <Boolean> with ON if you want 32-bit disk access enabled; replace it with OFF if you do not want 32-bit disk access enabled.

8. Start Windows. If you do not receive any errors, you have successfully recreated your SYSTEM.INI file.

At this point, try recreating the issue you were having. If the issue is not reproducible, then there was something in your SYSTEM.INI file that was causing a issue. Troubleshooting SYSTEM.INI file issues goes beyond the capacity of Claris Technical Support to assist you. At this point it is recommended that you contact Microsoft's Technical Support for more information on your SYSTEM.INI file.

If the new SYSTEM.INI file does not fix the issue, the you can rename your backed up SYSTEM.INI from STEP #1

Text Pasting as OLE Object into ClarisWorks for Windows 4.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When trying to copy text from Wordpad and paste it in a Clarisworks word processing document, the text is pasted as an OLE object rather than as text.

If you open your preferences and select the general option, you will see a check box titled "OLE Menu Items". By default this box is unchecked. If you check this box, you will then under the Edit menu get several new options:

Paste Special
Insert Object
Object
Links
Show Objects

To copy just the text into your document, you must select Paste Special from the Edit menu, and specify that you want the data to be pasted as text.

By allowing you to copy OLE objects into your documents, you have more flexibility to create better looking documents and also edit them with the native application.

Unable to Open your ClarisImpact 2.0v1 File?

Upon attempting to open the file, the alert, "Not enough memory to complete this operation" appears and the file cannot be opened regardless of how much memory you've allotted to ClarisImpact.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
There is a "known" problem with ClarisImpact 2.0v1 for the Macintosh computer that can result in file corruption. The corruption is usually to such degree that the file can no longer be opened or used in any way. Upon attempting to open the file, the alert, "Not enough memory to complete this operation" appears and the file cannot be opened regardless of how much memory you've allocated to ClarisImpact.

This problem was addressed by Claris Engineering and released in ClarisImpact 2.0v2.

Once you've updated to version 2.0v2 and save your files created in v1 again, things will be okay , however, if a file opens in 2.0v2 but crashes frequently, copying and pasting to a fresh 2.0v2 document is recommended.

Contact List Preview Too Small to Read

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When printing your Contact List, you may notice that the page preview is almost too small to read. If you would like to have a list of your contacts printed for your organizer, make sure you have Address Book selected. When you specify Contact List in the Print menu, Claris Organizer will attempt to put all your contacts on one page. This requires the font to be too small to read. Change it from Contact List to Address Book and the print out will come out in the desired type size.

"File is Busy" Message during PowerBook Synchronization

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Synchronizing Claris Organizer files to a PowerBook will return an error message stating that: "File is busy", it will be followed by another message stating, "The two files could not be synchronized because the file could not be opened."

Instant Organizer will not allow synchronization to take place when docked or connected to a PowerBook. Copy the file to the desktop computer and then Synchronize the file. After synchronization has been completed, transfer the file back to the PowerBook and replace the other file with this new file.

Cannot Eject Disk with Instant Organizer File Active

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you open a Claris Organizer 2.0 file from a floppy disk and Instant Organizer is active, you may have trouble ejecting that disk. Instant Organizer activates the file that was opened most recently and will not allow you to copy or remove that file until another file is activated. You can deactivate Instant Organizer by restarting with your Extensions off.

This will also be true if the file was opened from a SyQuest, Zip or other removable hard drives.

Error: "Can‘t open temporary file, do you own it?"

This error message comes from your Internet Provider, not from Emailer.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Issue:
When I try to connect to my Internet Provider, I can't get my mail and I get the following error message in my Connection Log:

Execution of Schedule "Connect Now" at Thu, Sep 19, 1996
Connecting To Internet using Account "My Internet Account"
Checking for mail
** -ERR System error, can't open temporary file, do you own it?

Answer:
This error comes from the mail server at your Internet Provider. It is not a Claris Emailer issue. If you continually get this message, you can call your provider and ask them to solve the problem with the temporary file on their server.

Claris Emailer 1.1v3: Who Should Upgrade?

Reasons to upgrade to Claris Emailer 1.1v3 and Claris Emailer 1.1v3.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Claris Emailer 1.1v3
You only need to upgrade to Claris Emailer 1.1v3 if you are running Open Transport 1.1.1. There are no other advantages to upgrading if you are not running Open Transport 1.1.1. If you are not running Claris Emailer 1.1v2, you should upgrade this version.

Claris Emailer Lite 1.1v3
You should upgrade to Claris Emailer Lite 1.1v3 if you are using Open Transport 1.1.1 or if you would like to take advantage of these new features.

WELCOME TO CLARIS EMAILER
Thank you for choosing Claris Emailer.(TM) This Read Me file documents some additional tips that may prove helpful when using Claris Emailer, including a description of changes for users of previous versions of the program.

In particular, this document provides information about:

1. Terminology used for Internet account setup
2. New features in Claris Emailer 1.1
3. New features in Claris Emailer 1.0v3 and 1.0v2
4. Where to go for more information and help
5. Changes and fixes

1. TERMINOLOGY USED FOR INTERNET ACCOUNT SETUP
The terminology used to set up Internet accounts has been changed since the printing of the manual. The new terminology is now the same as that used by the Internet Configuration System (Internet Config). Internet Config is a tool available from online services that allows applications that are Internet aware to share a common setup.

Old term New term
POP account Email account
POP password Email password
SMTP server SMTP host
Return address Email address

Please see pages 1-4 and 6-12 of the Claris Emailer User's Guide for more information on setting up an Internet account.

2. NEW FEATURES IN CLARIS EMAILER 1.1
In addition to numerous smaller enhancements, Claris Emailer 1.1 has nine new features added since 1.0v3.

- Support for Claris OfficeMail
- Drag and Drop Text Files into Messages
- Messages Deleted in the Filing Cabinet are Moved to Deleted Mail
- Local Preferences
- Specify Recipient Type in Find Address
- Enhanced Support for Addresses
- Choose a Sound for New Mail
- Folders can be sent as Enclosures

Support for Claris OfficeMail

Claris Emailer connects to Claris OfficeMail. Claris OfficeMail is a LAN email solution for work groups and small businesses. It includes support for a gateway connection to the Internet.

Drag and Drop Text Files into Messages

You can drag a text file from the Finder into the body of a message. This is similar to capabilities available with desktop clippings.

Messages Deleted in the Filing Cabinet are Moved to Deleted Mail

Items that are deleted from folders in the Filing Cabinet are now moved into the Deleted Mail folder, not deleted from disk. Of course, if the message is already in the Deleted Mail folder, then the message is deleted.

Local Preferences

You can now keep the Claris Emailer Preferences file in the same folder as Claris Emailer. This can be useful if you keep Claris Emailer on a removable disk. You can also use a local preferences file to run more than one copy of Claris Emailer simultaneously on a single machine.

To use a local preferences file, copy the Claris Emailer Preferences file from the Claris folder in the System Folder into the Claris Emailer Folder. A local preferences file is always used instead of a preferences file in the Claris folder. When you use a local preferences file, the title of the Claris Emailer Browser window changes to reflect the name of the copy of the Claris Emailer that you are running.

Specify Recipient Type in Find Address

The Find Address dialog now allows the user to select what type of recipient the selected addresses should be (To, CC, or BCC). The recipient type defaults to the type of the current row in the addressing window.

Enhanced Support for Addresses

Claris Emailer allows you to drag the text of an email address to a number of places including the recipient list and the address book. Claris Emailer now recognizes the following forms of text drags:

sally_jones@host.com
Sally Jones, sally_jones@host.com
"Sally Jones" <sally_jones@host.com>
Sally Jones <sally_jones@host.com>
"Sally Jones" sally_jones@host.com
sally_jones@host.com (Sally Jones)
<sally_jones@host.com> (Sally Jones)

Claris Emailer has always supported command-clicking a URL (Uniform Resource Locator) if Internet Config is installed. There is now support for command-clicking on an email address even if Internet Config is not installed. To command-click an address with a name, select the entire name and address, then, while holding down the command key, click on the highlighted text.

Choose a Sound for New Mail

You can now choose a sound to be played when you receive new mail. Use the Play Sound pop-up menu in the Preferences to choose the sound. Note that you can also specify a sound to be used for each Claris OfficeMail account if Claris Emailer is not running.

Folders can be sent as Enclosures

Folders can be sent as enclosures by dragging a folder to the enclosures area of an outgoing message. Note that you cannot add a folder by using the Find Enclosure or Add Enclosure buttons.

3. NEW FEATURES IN CLARIS EMAILER 1.0v2 AND 1.0v3
Claris Emailer 1.0v2 and 1.0v3 had eight new features added since 1.0.

- Save As Text
- Execute an AppleScript Document for a Schedule
- Native Open Transport
- Connect Again
- More Information During a Connection
- Internet Config Settings Display
- Default Encoding Setting for Internet Enclosures

These features are incorporated into Claris Emailer 1.1.

Save As Text

You can save any message that you are viewing as a text file. The text file can be opened by a text editor, word processor, and many other applications.

To save a message as a text file, follow these steps:

1. Open the message. The message can be in the In Box, Out Box, or in the Filing Cabinet.

2. From the File menu, select the "Save As Text" menu item. A save file dialog box is displayed.

3. Enter a name for the document and click the Save button.

In addition to the Save As Text feature, Claris Emailer installs an XTND translator for saved Claris Emailer messages. The XTND translator allows applications like ClarisWorks to directly open messages saved in the Filing Cabinet.

Execute an AppleScript Document for a Schedule

Claris Emailer allows you to execute an AppleScript document as part of a schedule. The AppleScript document can instruct Claris Emailer to connect to one or more accounts or services.

To install an AppleScript document:

1. Locate the AppleScripts folder inside the "Claris Emailer Files" folder.

2. Copy the AppleScript document into the folder.

To select an AppleScript document to execute at scheduled times:

1. From the Setup menu, select the Schedules menu item. The list of schedules is displayed.

2. Click the Add button to create a new schedule or select an existing schedule and click the Open button to edit an existing schedule. The schedule dialog box is displayed.

3. In the upper left side of the dialog box, select AppleScript from the Execute pop-up menu. A new pop-up menu listing the available AppleScripts is displayed below the Execute pop-up menu.

4. Choose the AppleScript to execute from the AppleScript pop-up menu.

Two example AppleScripts are included. They are located in the folder "Scripting Claris Emailer" which is in the "Support Files" folder.

* All Services - This example simply connects to each service.

* Internet via MacPPP - The AppleScript opens a TCP connection via MacPPP, connects to your default Internet account, and then closes the MacPPP connection. This AppleScript is also installed in the AppleScript folder and is available to your schedules. Note that you must have the "MacPPP Control" AppleScript addition installed.

Here is one location on the Internet for MacPPPControl:
http://www.claris.com/support/products/emailer/docs/freeppp.html

Note: AppleScript is provided with System 7 Pro and System 7.5. If you're using System 7.0 and 7.1, AppleScript is available from Apple Computer Inc.

Native Open Transport

Open Transport is a new networking technology from Apple Computer that provides enhanced networking. When Open Transport TCP is installed, Claris Emailer uses Open Transport for Internet connections. This can improve performance when compared to MacTCP.

Connect Again

The Connect Again feature immediately connects using the previous Connect Now settings. This is quicker than Connect Now since the Connect Now dialog box is not displayed.

The Connect Now menu item is the last menu item in the Mail menu. It uses command-option-K as a keyboard equivalent.

More Information During a Connection

The Connection Status window displays more information about the current connection. This information includes:

- The subject of the current message.
- An estimate of the current data throughput.
- Notice if there was no mail waiting.

Internet Config Settings Display

When the checkbox "Use Internet Config" is selected in the Internet account setup, the Internet Config information is displayed in the account fields. The settings cannot be edited since they come from Internet Config.

Default Encoding Settings for Internet Enclosures

You can now set a default encoding to use when sending an enclosure via the Internet. Click the Options button in the Internet account setup to change the setting.

4. WHERE TO GO FOR MORE INFORMATION AND HELP
Claris Emailer includes files which contain special tips for using Claris Emailer. These files are in the Support Files folder.

* Claris Emailer FAQ (Q&A) 1 & 2 - These files contain frequently asked questions (FAQs) about Claris Emailer. Read these file for tips on configuring and using Claris Emailer.

* Apple Modem Tool Tips - This file contains instructions on configuring the Apple Modem Tool. The Apple Modem Tool can be used to connect to America Online and CompuServe.

There are three folders in the Support Files folder.

* Claris Emailer XTND Translator - This folder contains information about installing and using the Claris Emailer XTND translator. The translator allows other programs to open Claris Emailer messages that have been saved in the Claris Emailer Filing Cabinet.

* AppleScripts for Schedules - This folder contains AppleScripts that can be executed from Claris Emailer schedules.

* Example AppleScripts - This folder contains AppleScripts that demonstrate how to use AppleScript to control Claris Emailer.

For the latest information, visit the Claris Emailer Home Page at:
http://www.claris.com/support/products/ClarisEmailer/index.html

* There is a mailing list dedicated to Claris Emailer. Mailing lists provide a place for people with similar interests to communicate with each other. The Claris Emailer mailing list is called Emailer-Talk.

To subscribe to the Emailer-Talk mailing list, send an email message to:

emailer-talk-request@eskimo.com

In the subject enter:

subscribe

Because of the volume of mail that you might receive via the mailing list, you may want to set up a Mail Action to manage the mail. A possible Mail Action would be the following which would move the Emailer-Talk messages into the Filing Cabinet.

If any recipient contains "emailer-talk"
File message in "Emailer-Talk Folder"

Note: The Emailer-Talk mailing list is run by an independent organization and is not in any way associated with Claris or Apple Computer.

5. CHANGES AND FIXES
Following are the changes and fixes that were made in 1.0v2, 1.0v3, 1.1v1, 1.1v2 and 1.1v3.

Changes and Fixes in 1.1v3

* Made changes to run properly under Open Transport (OT) 1.1.1.
* Fixed problem where encoded subjects in outgoing Internet mail could show up in an error log.

Changes and Fixes in 1.1v2

* The "connect to" AppleScript command now waits until a connection is done.

Changes and Fixes in 1.1v1

* The eWorld service has been removed.

* The enriched text information in Internet messages (text styles) is stripped leaving only the text of the message.
* Opening new messages is generally faster.
* SimpleText or TeachText read only files can be dragged into the message body.
* When importing address books, the number of items imported is reported.
* "(No Subject)" is inserted as the subject in outgoing messages sent via AOL.
* Claris Emailer previously filled in a user's name if they are in the address book. Claris Emailer no longer fills in the name if the name is specified with the address that was received.
* You can now paste an address of the form: "First Last" address@host.com into the address field of an outgoing message.
* Better handling of SMTP servers that respond with two-line responses. This problem caused synchronization errors when sending more than one message.
* Better management of low memory situations.
* Implemented the ability to send CompuServe messages with "No encoding" specified.
* Added x-sender: header to outgoing Internet messages when the email account is different than the email address.
* Proper error message is reported when trying to send stuffed aliases or unstuffed folders.

Changes and Fixes in 1.0v3

* Internet account options are now accessed via a button called Options.
* Domain names are now cached for Open Transport connections.
* America Online TCP connections are now Open Transport native.
* Added support for Open Transport on 68K Macintosh.
* Leading spaces in incoming subjects are stripped.
* Creating new folders in the Filing Cabinet no longer gives an error message.
* The Type field on outgoing messages can no longer be blank.
* Toggling arrows in a new mail window no longer marks a message as changed.
* Clicking the recipient or enclosure tab no longer marks a message as changed.
* Meta-characters are now stripped out of Window menu listings of Filing Cabinet windows.
* Incoming CompuServe messages with extended envelopes that have greater than 50 recipients are now managed properly.
* Enhanced error reporting format for unknown errors in the connection logs.
* Now recovers better from addressing errors in Internet connections.
* Errors for invalid local recipients for Internet messages are now reported.
* When sending hundreds of messages at once, no longer reports "too many files open."
* Header "titles" are now in bold in the newly renamed Show Original Headers dialog.
* The filename variable in content-disposition headers of Internet messages are now handled properly.
* Outgoing quoted-printable messages with enclosures are now handled better.
* Now writes a date header for outgoing Internet messages.

Changes and Fixes in 1.0v2

* No longer loses memory after many connections to America Online.
* Dates on some incoming messages could be wrong in 1.0. They are correct in 1.0v2. Claris Emailer uses your location on the earth to establish the local time. Make sure that you have used the Date & Time control panel to set your Macintosh's time zone and daylight savings time.
* Closing a message window with unsaved changes now prompts you to save the changes. The previous version always saved the changes.
* Outgoing messages via the Internet now use quoted printable encoding when the message includes extended ASCII characters. This allows you to send messages containing characters not in the ASCII character set such as curly quotes or European characters.

Claris(R) and the Claris Emailer team thank you for your purchase of Claris Emailer. Your support, comments, and suggestions help us to continue to bring you better solutions for your future productivity needs.

Word wrapping from Internet mail received on CompuServe address using Claris Emailer

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Q: When I receive E-mail through my CompuServe E-mail address, that comes off the internet (Not a CompuServe customer) The box in the lower corner of the mail says "Fixed Margins" I always do a select all and copy, then open a new ClarisWorks file and move the text. When I do this the first line goes across the page to the right margin, then wraps the next 3 or 4 words. It then goes to the next line and starts over, even though this is not a new sentence or paragraph. In order to get the letter in the proper paragraph format, I have to go to the beginning of a new line and do a delete, then ad a space. For 3 and 4 page letters this is time consuming.

A: The reason this happens is that each line of the email ends in a carriage return, so when you paste it into ClarisWorks (or any other word processor), the carriage returns are also pasted in. Each line, however, is longer than what can fit in the word-processing document, so each line wraps also. One way of fixing this is to use a smaller font size in the WP document.

Another way is to do strip out the carriage returns via find and replace. First set the find to look for two consecutive carriage returns, and set the replace as a combination that wouldn't be in the document normally (I use a double bullet--two option-8 characters in a row). Then Change All. Next, set find to one carriage return and replace to one space, and do another Change All. Finally, find the two bullets and change them back to two carriage returns, using find/change as before.

ClarisWorks and Art Explosion - MTIFF Translator

Nova Development's Art Explosion clip art collection uses a special "MTIFF" translator that may conflict with the existing TIFF translator in ClarisWorks.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Users who install Art Explosion automatically install an XTND translator called MTIFF. This allows ClarisWorks to open the files on the Art Explosion CD ROMs. However, Claris's TIFF translator is left in place and the two may conflict. Users must remove the old TIFF translator in order to open the clip art items. MTIFF is supposed to also handle normal TIFF files; this has not been conclusively tested by Claris.

The MTIFF XTND translator is not a Claris product, it is a product of Nova Development, the makers of Art Explosion.

Database Field of Type: Name Sorts Incorrectly

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Example: If you create a field called 'Full Name' of type Name and enter the following data into the field:
William Gold
Alex Gold
Gordan Gold

When you sort, you expect the results to be:
Alex Gold
Gordan Gold
William Gold

But the results are:
Alex Gold
William Gold
Gordon Gold

If you change the name Gordon to Cassey, it will sort correctly. If you change the name Gordon to Harry or Gary, the sort will be incorrect.

The ClarisWorks development team is currently looking into this issue. The only work around is to change the 'Full Name' field into 2 text fields 'First Name' and 'Last Name' and sort by 'Last Name' then 'First Name'.

Changing Decors on Some Computers May Take a Long Time When Using a Large Virtual Memory Setting

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

With Virtual Memory turned on, it will take longer for Claris Organizer to change the decors. To fix this issue, increase the amount of RAM in the computer instead of using Virtual Memory.

Functions Not to Use in the Match Command

Functions that cannot or should not be used in a Match command formula

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

The following commands have no meaning when used in the Match Command.
ALERT(value)
BEEP()
CHOOSE(index, value)
COLUMN()
ERROR()
HLOOKUP(lookup-value, compare-range, index, {method})
INDEX(range, row, column)
IRR()
ISNA(value)
LOOKUP(lookup-value, compare-range, index, {method})
LOWER()
MACRO(text)
MATCH(lookup-value, compare-range, {type})
NA()
PROPER(text)
REPLACE(old text,start num,num chars,new text)
REPT(text,# of times)
ROW()
TYPE(value)
UPPER()
VLOOKUP(lookup-value, compare-range, result-range, {method})

Although many of the business and financial functions can be used in the Match command they may not yield the desired result if used incorrectly. The result must be evaluated to a single value and the function can not use a range of values in any of the variables. Any variable expected as a single value may be entered in the Match formula as a referenced field. Since when using these functions the end result is a single value it is probably better to use the function in a calculation field and match for the result rather than using the function in the Match command.

For example, in the function Present-Value -- PV(interest rate per period, number of periods, payment to be made each period, {future value, type}) -- the value in each variable is a single entry therefore this function could be used in a Match formula.
The function Net-Present-Value -- NPV(interest-rate, payment1, payment2,.payment3,...) -- uses a range of payments that would not work if referenced as a single field. [example: NPV(10, Payment)] But, if each payment is referenced as an individual field then the formula would evaluate each record and could be used.[example: NPV(10, payment1, payment2, payment3)].

PowerBooks Using PCMCIA Modem Cards

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Many PowerBook models have PCMCIA card slots that can accommodate a network card, modem card or a combination of the two. When users of these PowerBooks use a PCMCIA card for their modem they will have to use the modem tool that shipped with the modem when setting up their settings in Claris Emailer or any other Claris product that can dial through a modem. (See figure 1) The other alternative for these PowerBooks is to use the Printer/Modem port selection with an external modem.

Making Footnote Numbers More Readable

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Background:
ClarisWorks versions 1.x, 2.x and 3.x:
Footnote numbers use the Superscript style. When a footnote number is created, ClarisWorks applies the Superscript style and assigns it a size that's about 3/4 of the size of the adjacent text. So, if you add a footnote to some 12 point text, the footnote number is generated in 9 point superscript.

ClarisWorks version 4.x:
Footnote numbers use a newly added style called Superior. The Superior style scales the font size down internally. For example, if you footnote some 12 point text, then select the footnote and check the size, it is still defined as 12 point text even though it is visibly smaller.

The benefit of Superior style is that it's scalable. That is, if you resize the text later, the Superior style will automatically scale the footnote number to the correct size. The Superior style is also optimized for printing the correct size characters for footnotes.

However, these Superior-styled footnote numbers may be difficult to read on screen. They can be so small that the screen does not have enough resolution to display them properly.

Workaround:
You can edit the Style used for footnote numbers so that it uses the superscript style, like earlier versions of ClarisWorks. You will lose the benefits of scalability and optimization for printing, but this will make them more readable on screen.

To edit this style, choose Show Styles from the View menu. Select the Footnote Index style, then click the Edit button. Choose 'Superscript' and '9 point' from the menus. Click Done. All your existing footnote numbers will change to match the new style settings.

Issues Beyond the Year 2040

If your calendar goes beyond the year 2040, you may encounter some issues when browsing the monthly or weekly calendar.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

If your calendar goes beyond the year 2040, you may encounter some issues when browsing the monthly or weekly calendar.

This is a limitation with the current Macintosh operating system. System 7.X it is not currently designed to work with dates past the year 2040. It is expected that that future versions of the Macintosh Operating System will solve the limitation but we cannot know for certain until it has been released.

Reducing the Probability of Illegal Operation Errors in Windows 95

Here are some troubleshooting techniques to reduce the probability of encountering Illegal Operation Errors in Windows 95

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
In Windows 95, it is never completely clear why Illegal Operation Errors occur. The reasons for these errors can be anything from the printer driver to the type of hard drive controller. It is best to make sure that you are using the latest video driver and printer driver for your system before you move on to the following troubleshooting steps.

Here are some things to try:

1] Use the ctrl-alt-del function to bring up the task list. There is a possibility that a program that you have running in the background might be conflicting with the application that reported the illegal operation error. The only programs that you need to run in the background are a] explorer and b] systray. You should use the end task function to make sure that your application has the full attention of your CPU.

2] Run scandisk.exe and defrag.exe on your hard drive(s). These are basic programs that come installed on Windows 95 machines and they searche for general maintenance errors and fix them.

3] a) In the Start menu, select control panels and system. In system, select performance and then file system. The typical role of the machine should be set to network server.

b) Chances are the illegal operation error occurred because of a memory conflict in your system. This may result because there wasn't enough memory available for the specific application being used. Everything about Windows 95 is memory related. If you installed Windows 95 using the default configurations, your machine is using virtual memory. You can check this by going to settings from the start menu/control panels/ system/performance/virtual memory. Select "let me manage my own virtual memory settings". The virtual memory settings should be: the minimum swap file size should be the amount of memory that you have installed and the maximum swap file size should be set to your memory installed doubled. For example, on a machine that has 16mb ram installed, your minimum swap file size should be set to 16mb and your maximum swap file size should be set to 32mb.

The best defense against the Illegal Operation Error message in Windows 95 is maintenance. If you can make sure that all of the above steps have been performed, you can reduce the probability of getting the dreaded Illegal Operation Error message in Windows 95.

Macintosh-to-Amiga Amiga Graphics Transfer

I want to convert Amiga screens to the Macintosh. I don't write Macintosh programs, but I want to use the Macintosh with PageMaker to document Amiga the games.
This article has been archived and is no longer updated by Apple.
GIF, an interchange format designed by CompuServe, is one of the most-used file formats for moving graphic images between different computer platforms. Various utilities are available in both the Macintosh and Amiga public domain arenas for converting standard graphic file formats to the GIF interchange format. Once in this format, just transfer the GIF files to the Macintosh.

On the Macintosh side, there is a utility called Giffer that reads a GIF file and writes a PICT file. The PICT file can then be placed in the PageMaker documents.

Getting the Out of Hard Drive Space Error Message when Trying to Install FileMaker Pro 3.0 , ClarisWorks 3.0 or ClarisWorks 4.0 in Windows 95.

If you get the"out of hard drive space" error while installing these programs and you are not out of hard drive space, here's a remedy.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The "out of hard drive space" error in Windows 95 can be misleading; you may have plenty of room on your hard drive, but you keep receiving this error message every time you attempt to install FileMaker Pro 3,ClarisWorks 3 or ClarisWorks 4.
In the control panels, select "system/performance/file system/troubleshooting/", make sure that, "disable long name preservation for old programs " is unchecked. This option is intended for system administrators only and sometimes, mistakenly, has been checked.
When "disable long name preservation for old programs" is checked, the install program gets to a point and tries to install a file which has a long file name. When the long file name preservation scheme has been disabled, your machine will not recognize long file names. The install program responds to the flag, as if it was told to stop installing, and thinks there is not enough room to install the program, thus resulting in the "out of hard drive space error" message.

Macintosh Electronic Documentation (E-Docs) Information

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Some Macintosh ClarisWorks 4.0 customers get an electronic version of the documentation. The electronic docs consist of a data file and an application. The application is called "E-Doc 1.0.20", which is by Modern Age Books. The data file is called "ClarisWorks 4.0 User's Guide".

Electronic User Guides in Modern Age Book format are also available for FileMaker Pro 3.0, ClarisDraw, ClarisImpact 2.0 and Organizer 1.0.

Troubleshooting:
Troubleshooting is the same as with any other application. If you double-click on the User Guide file and get an "application can't be found" alert, try drop-launching the User Guide onto the E-Doc application. Rebuild the desktop to solve this problem permanently.

If you can't find the E-Doc application, try using Find File to locate it. If you can't find it with Find File, the application has been deleted, and needs to be replaced.

E-Doc Read Me
Notes on using the E-Doc Application

Memory Allocation
═══════════════

If you have a large size color monitor, you may want to increase the memory allocated to the E-Doc application after it has been installed.

The standard memory configuration is for 2,500K. This should be fine for any system with a standard size monitor (640 x 480). If your monitor is larger and you want to view a book at the full size of your screen, you should allocate more memory for E-Doc.

To increase the memory available to E-Doc, select E-Doc in the finder and select Get Info (Command-I) from the File menu. To Increase the memory, type a larger value into the Preferred size field.

The default setting will be 2500, so try putting in a value of 3000.

Defining a User
═══════════

Before Bookmarks or Annotations can be added to a book, you must first define a User.

Both Bookmarks and Annotations are stored separately for each defined user. This way more than one person can read the book and create bookmarks and annotations for themselves.

After Dark Screen Saver
═══════════════════

Problems have been encountered when running some versions of the screen saver, After Dark, with E-Doc. If you experience any problems, turn off After Dark before using E-Doc.

E-Doc Help File

This Help file covers the electronic book commands and options.

Buttons
═══

Note: Before creating annotations and bookmarks, please define a user first from the User Menu. Annotations and Bookmarks are kept separately for each user.

Paper Clip - Used to add annotations to an electronic book.
To Use: Click on the Paper Clip and drag the pointer onto the paragraph in the text that you would like to be annotated. A dialog box will appear and text can be entered for this annotation. When done, click OK and a Paper Clip Icon will now appear in the text. Click on the icon to bring up the dialog box again and view the annotation text.

Yellow Stickies - Used to add bookmarks to an electronic book. To Use: Click on the Yellow Sticky and a dialog will appear with the suggested title for the bookmark. The text can be changed, if desired. After clicking OK to save the bookmark, a yellow tab at the top of the book will appear representing the bookmark. Click on the tab to bring you back to that position in the electronic book.

Browse Arrows - Used to move forward or backward one chapter in the electronic book. To Use: Click on the right arrow to go forward one chapter. Click on the left arrow to go backward one chapter.

Contents - Displays the book table of contents.

Index - Displays the Index Window.
To Use: Click on the button to bring up the window. The window can be repositioned. Select an index entry and click the Goto button to move to that location within the book.
Back - Returns to the last known position within the book.

History - Displays the History Window.
To Use: Click on the button to bring up the window. The window can be repositioned. Select an entry in the list and click the Goto button to move to that location in the book.

Search - Displays the Search Window.
To Use: Click on the button to bring up the window. The window can be repositioned. Type a search string into the field next to the Search Button. When done, click the Search button or hit the return or enter key to begin the search. Matching entries will be displayed in the list. Double Clicking on any entry will expand the items list for that entry. The Previous / Next buttons at the bottom of the screen will bring you from entry to entry within the text of the book. The Rev / Fwd buttons move one complete section at a time, ignoring the individual entries in the search window. The View button expands or contracts the search window to allow more room for viewing the book while browsing the search results. The Options button brings up a dialog that allows the search to be restricted to just one chapter within the book. The Exit button closes the search window.

Font Scale Slider - Used to adjust the display size of the electronic book. The scale can be set from 50% to 150%. Double Clicking the percentage (starts at 100%) will reset the scale to 100%. To Use: Click and drag the font scale knob and move left to reduce the scale. Move right to increase the scale.

Menus
=====
File Menu
Open - Opens an Electronic Book.
Close - Closes an Electronic Book.
Page Setup - Defines the page setup for a print.
Print - Prints selected chapters from the electronic book.
Quit - Exits the application.

Edit Menu
Copy - Places the displayed text onto the clipboard.
Annotate - Brings up the annotation dialog box.

Goto Menu
Menu items vary with each electronic book. Each Item brings you to a specific area of the book.

User Menu
Define - Brings up the define user dialog box.
User List - The remaining menu items are Users that are already defined for this book. Choosing a user from the list makes that user active.

Bookmark Menu
Define - Brings up the define bookmark dialog box.
Bookmark List - The remaining menu items are bookmarks that have been defined for this book by the current user. Choosing a bookmark from this list will bring you to that location in the book.

Tabs
====
Each electronic book will have a unique set of tabs located on the right side of the book window. Clicking on a tab will bring you to a specific location in the book. Usually this will be the beginning of a chapter.

Leaving the cursor over a tab for a few seconds will bring up a description of where the tab will bring you within the book.

StyleWriter Driver 7.2.3 Exhibits Strange Printouts with Certain Fonts

Printing full justification with StyleWriter driver 7.2.3

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

If you are printing in MacWrite II or ClarisWorks and you are using a StyleWriter you might find your text running off the page when you print. The Style Writer 7.2.3 driver has a issue which will not allow the documents written in MacWrite II and even ClarisWorks 4.0 to print in "Times" when the document is set to full justification. If the font type is changed to a monospaced font such as Geneva or Monaco, then it will print properly.

A document written in Clarisworks 4.0, which contains the proportional Times font with full justification turned on, will also demonstrate the same issue when you print to a StyleWriter with driver 7.1 . If you must use the Times font, the current solution is to use the Stylewriter II or StyleWriter 1200 driver.

Altsys Metamorphosis: Utility to Retrieve Fonts

How can I retrieve the font outlines from the LaserWriter hard disk and save them in Illustrator, Fontographer, and Type 3 font formats?
This article has been archived and is no longer updated by Apple.
Try Metamorphosis from Altsys. It can retrieve the font outlines from the LaserWriter hard disk and save them in Illustrator, Fontographer, and Type 3 font formats. This will work well for all Type 3 fonts that have been loaded on the LaserWriters hard disk. However, as of April, 1990, any Type 1 Adobe fonts that are on the hard disk can be retrieved only as Type 3 fonts.

‘ObjectSupportLib‘ versions 1.0.4 and 1.1.1 Break Some Application‘s Apple Events Handling

Claris is distributing v1.1 of the OSL:

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
It has recently come to our attention that some applications install versions of the 'ObjectSupportLib' which cause several other programs (including FileMaker Pro) to stop handling Apple events. In this event, formerly functioning Apple Scripts will now generate an error. Reinstalling an appropriate version of the OSL should solve this issue.

Specifically, if you have installed the America Online 3.0 Evaluation software, it has installed a version of the OSL (v 1.1.1) which breaks our AE handling. OSL 1.1 does not have this issue.

What exactly is the issue?

Following Apple guidelines, FileMaker Pro checks with the Gestalt Manager to see that the ObjectSupportLib is indeed installed on the given machine. If the OSL is available, the event is passed along to FileMaker Pro, and the magic happens. This occurs whenever an Apple event is sent to FileMaker Pro (except when the application is launched from the Finder).

This is all well and good, except that the specific version of the OSL that is being discussed does not register itself with the Gestalt Manager. Hence, whenever FileMaker Pro receives and Apple event, it needs to be sure that the ObjectSupportLib is available. To do that it asks the Gestalt Manager if the OSL is around. The Gestalt Manager will always report that the OSL (at least version 1.1.1) is NOT available, and so the Apple event will NOT be handled.

It has been suggested that if an application NEEDS OSL 1.1.1, you can have DUAL FUNCTIONALITY if you install the appropriate version of the OSL in the given application's folder. In other words, if America Online 3.0 absolutely REQUIRES that OSL 1.1.1 be available to it (and we know that FileMaker Pro 3.0 needs OSL 1.1) you could put the OSL 1.1.1 file in America Online's application folder (right next to the application itself) and the OSL 1.1 file right into the FileMaker Pro 3.0 folder (ditto). We only offer this as a suggestion, as we have not tested this option.

If this does not work for you, or this is simply not a viable option, you may need to simply determine which application has a greater need for AppleScript in your given situation.

WEB Servers - Third Party Software

This article provides a partial list of third-party software titles which provide WEB servers for the Mac OS.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
This article provides a partial list of third-party software titles which provide WEB servers for the Mac OS. This article provides information about products which are not manufactured by Claris. Claris is not responsible for the contents. Please contact the vendor for additional information.

WEB (http and WWW) Servers for the Apple Macintosh

Web*Star 1.3.1 - From StarNine/QuarterDeck - http://www.starnine.com/

WebSTAR helps you publish hypertext documents to millions of Web users around the world, right from your Macintosh. You can also use WebSTAR to put any Macintosh file on the Web, including GIF and JPEG images, Shockwave movies, QuickTime VR, and Java applets. And yet, using WebSTAR is as easy as double-clicking. Plus, it's faster than many Web servers
running on UNIX.

Currently Bundled on Apple Internet Server Solutions for the WWW.

NetPresenz 4.0.1 - From Peter Lewis, Stairways Software - http://www.share.com/peterlewis/

NetPresenz allows your Macintosh to become an FTP, WWW, or Gopher server so that other people can get information from your Mac over the Internet. It honors the Users & Groups privileges and passwords and supports multiple logins, anonymous FTP (user name "anonymous" or "ftp"), full CGI support, MacBinary and BinHex transfers and much more.
It runs either as a background only application or as a normal application displaying the log file.

MacHTTP 2.2.2 - From Chuck Shotton - http://www.biap.com/
http://www.starnine.com/

MacHTTP is a shareware product, and is best used for small or internal web sites. It is the most widely-used desktop Web server on the Internet.

WebSTAR and StarNine - The commercial version of MacHTTP has become StarNine's new WebSTAR product. For more details on WebSTAR, upgrades from MacHTTP, etc., check StarNine Technology's home page.

Boulevard 1.0b21 - http://www.resnova.com/boulevard/

Boulevard for MacOS is a high performance, full featured web server, designed to host professional web sites. The Boulevard interface is rich, elegant, and easy to use. Boulevard supports CGIs, ACGIs, and W*API plug-ins. The server has built-in support for many functions that are traditionally handled by CGIs, making Boulevard a faster and more economical choice than other Macintosh web servers.

RushHour - http://www.maxum.com/

RushHour is the Macintosh Web server optimized for what is probably the vast majority of your server volume - Graphics. Your full-featured Web server, like StarNine's WebSTAR, handles all sorts of files under virtually any conditions, but most of the overhead involved in doing so
is unnecessary for most files. RushHour cuts out the overhead and adds a high-performance RAM cache to serve your GIF, JPEG, and other large binary data with extreme speed.

Sonic Servers - http://www.sonicsys.com/

Sonic Internet Servers are a group of high performance software Internet Servers which make it easy and economical for businesses to establish a presence on the Internet as well as providing Intranet solutions for intra-office communications. This group of highly integrated Internet Servers includes Web, E-mail, FTP, DNS and DHCP. These servers run on any Macintosh computer and offer easy set-up and maintenance.

All Sonic Internet Servers can be configured and managed via InterManage, Sonic's common management interface application which is included with the Internet Servers. InterManage can access each Internet Server over the LAN or through the Internet, giving the network manager
the flexibility to perform configuration and maintenance from anywhere in the world!

Web for One - http://www.resnova.com/

Web for One(TM) is a personal web server designed to let every MacOS computer on a TCP/IP network publish documents on the Internet or LAN. For small business and home users with continuous Internet connections, this provides an easy and inexpensive way to establish a presence

on the Internet.

Web for One is a full featured web server, optimized to run in the background using very little memory. The web server supports CGIs, ACGIs, and has built-in support for image maps, server-side includes, server push, directory browsing and automatic form processing. By integrating these features with the server, users can create dynamic, interactive web pages without using expensive and cumbersome CGIs.

WebCenter - From Chris Hawk - http://www.slaphappy.com/

WebCenter is a high-performance web server for the Macintosh and Macintosh compatibles. It offers a wide range of features, making it suitable for virtually any Macintosh-based web site with features like: Multi-threading for fast connection handling, Full CGI compatibility with other MacOS web servers, Server Side Includes to create dynamic web pages, Memory-based file caching for fast file access, Customizable through AppleScript-ability and attach-ability Password-based file access through server realms, Allow or deny clients based on their network address, Power Mac native for quick performance, Open Transport native for maximum performance.

Distributed as freeware. No other MacOS web server has WebCenter's breadth of features. WebCenter is capable of handling tens of thousands of hits per day, enabling it service even the busiest of Macintosh-based web sites.

FireSite v1.0.2 - http://www.clearway.com/

FireSite gives you fast, interactive Web serving power at an affordable price. Before ClearWay created FireSite, running a Web server had to be expensive and complicated. FireSite cuts through the cost and complications, and makes your own interactive Web server an affordable reality. With FireSite, all you need to connect your own Web server to the Internet is a simple 28.8K modem and a regular phone line. FireSite automatically uses your Internet Service Provider as a lightning-fast 'graphics cache', and accelerates your Web site far beyond the speed limits of your modem!

Common Lisp Hypermedia Server (CL-HTTP)
http://www.ai.mit.edu/projects/iiip/doc/cl-http/home-page.html

CL-HTTP is a full-featured server for the Internet Hypertext Transfer Protocol (HTTP 1.1, HTML 2.0, & pre-HTML 3.0) that comes complete with source code.

A World-Wide Web (WWW) server was implemented in Common LISP in order to facilitate exploratory programming in the interactive hypermedia domain and to provide access to complex research programs, particularly artificial intelligence systems. The server was initially used to provide interfaces for document retrieval and for email servers. More advanced applications include interfaces to systems for inductive rule learning and natural-language question answering.

InterServer Publisher 1.2.1 - http://www.intercon.com/products/interserverp.html

InterCon's InterServer Publisher* answers the increasing demand for distributing information electronically. As the industry's first integrated Macintosh-based Internet server package, InterServer Publisher allows you to create a highly interactive Web, FTP (File Transfer Protocol), and Gopher server presence on the Internet in a matter of minutes.

NetWings HTTP Server - http://netwings.com/nw_home_pages/prod_info.html

Our NetWings and those Macs can get you and your students surfing and serving the Internet now. If you've got one Mac, or twenty. NetWings can let you serve and surf over any type of internet connection. It's software only, you don't need a router and it works on a LocalTalk or EtherTalk LAN. It caches pages. It has site blocking. It does web, ftp, gopher, email, and much more.

Web Server 4D - http://www.mdg.com/

Web Server 4D is a fast web server and a very fast relational database in one. This provides unparalleled site tracking without sacrificing performance. In fact, the author of Web Server Construction Kit For Macintosh (Hayden Books), Stewart Buskirk wrote in the comparisons of various packages that, "Web Server 4D is wicked fast!"

Web Server 4D can track new vs. repeat users, serves different pages based on domain, IP or browser, serves files from memory not slow disks, supports clickable maps, Guest Books, form to Email, inserts page counts, odometer page counts, current date, current time all without using CGI - although WS4D is compatible with CGI! Security for any file/folder is available with users and groups support (and tracking history for each realm, user and group!). Supports multiple hosts from one server. Other web servers cannot compare to the standard built-in features of WS4D. Developer edition includes open 4D source code which allows complete customization or integration with existing databases.

How to Avoid Showing Zeros if your Calculation Result is a Zero

Here is a description of how to create a calculation so that the result of zero will not display.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
To avoid showing zero as a calculation result, it is necessary to include a test for zero within the calculation.

For example, let's say we have two numbers we want to multiply. If the result is zero, we want nothing to be printed, however, if the result is anything other than zero, we want to see that value.

In a ClarisWorks spreadsheet, the calculation would appear as:

=IF((A5*B5)=0,"",A5*B5)

If the value in A5 multiplied by the value in B5 equals zero, print nothing (""), otherwise, print the result of A5 * B5.

In a Clarisworks database, this same formula would appear as:

IF('Number Field A'*'Number Field B'=0,"",'Number Field A'*'Number Field B')

If the value in Number Field A multiplied by the value in Number Field B equals zero, print nothing, otherwise, print the result of Number Field A * Number Field B.

Slashed Zeros in Spreadsheets

This article describes how to display and print slashed zeros.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
You can display and print slashed zeros in your ClarisWorks spreadsheets by using a font that has slashed zeros. These include " TTYFont" and "VT100" fonts that ClarisWorks installed on your system.

To change fonts, choose "Select All" from the Edit Menu, then choose the new font.

Transferring ClarisWorks Word Processing Documents into AppleWorks

This article describes why you may be having issues transferring ClarisWorks word processing documents in to AppleWorks.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

To transfer ClarisWorks word processing documents into AppleWorks, choose the "Save As" command from the File Menu. If AppleWorks cannot read the files, the likelihood is that you are probably using version 1.0 of PC Exchange. We have found a issue in PC Exchange that caused the program to create unreadable AppleWorks files on ProDOS disks. Your solution is to upgrade to the latest version of PC Exchange. You can find PC Exchange bundled with the latest version of System 7.5.X.

Converting Documents to ClarisWorks 4.0 for Macintosh

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks 4.0 includes an AppleScript application to automatically convert documents to ClarisWorks 4.0 format. The application is called "Convert Documents" and is located in the ClarisWorks Scripts folder, inside the ClarisWorks 4.0 folder.

Convert Documents will convert any document type that can be opened by ClarisWorks 4.0, including ClarisWorks 2.0 / 3.0 documents.

To convert all your old documents to ClarisWorks 4.0:
1- Place all your old documents into a folder
2- Launch ClarisWorks 4.0
3- If necessary, Click Cancel. Select Preferences from the Edit menu.
4- Click the General icon. Uncheck the checkboxes for "Old Version Alert" and, optionally, "[v4.0 suffix]". Click the Make Default button.
5- In the Finder, drag the folder icon containing your documents onto the Convert Documents icon. Your documents will be opened, converted and saved automatically. The names of the converted files will end in ".cwk"
TIP: change the folder view to View by Date. All the new converted documents will be listed first, so you can easily select them all and drag them to the desired folder in which you want to store the files.

Omnis 5.0: Solution for AppleTalk Printer Timeout Problem

I have problems printing long reports (20+ pages) from Omnis 5.0 to an ImageWriter II with AppleTalk Option Card. The print job halts randomly with this error message "Connection with printer has been lost."

This article has been archived and is no longer updated by Apple.
As of April, 1990, Omnis could not able to produce output quickly enough while generating a report to keep the printer from timing out. (This happens with both the AppleTalk ImageWriter and the LaserWriter.) This is similar to what we've seen with 4th Dimension.

The workaround is to have Omnis generate a page of output and then send the entire page to the printer. To do this, either put the report output into a list or spool it to disk. With a LaserWriter, you have an additional option of using background printing under MultiFinder. The page-at-a-time approach is what we've used with our 4th Dimension database.

Although we did not get into specifics, the Omnis people did not tie this problem to a problem with the AppleTalk ImageWriter driver. Instead, it seems to be a reality of printing reports that take a lot of processing when printing to any network-based printer.

Dictionary Versions and ClarisWorks

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
A version 1.0.3 of the dictionary was shipping with ClarisWorks 1.0 Macintosh. From version 2.0 through 4.0 of ClarisWorks the spelling dictionary version is 2.3. The name has been changed from Main dictionary to US English - Spelling, this has been the case since version 3.0 of ClarisWorks.

(The version 2.3 of the spelling dictionary can be used with any Macintosh versions of ClarisWorks from version 1.0 through version 4.0)

Canon Bubble Jet Setup Information

Canon Bubble Jet Setup information

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Some PC's currently out on the market (e.g. Compaq PCs) are configured in a way which is incompatible with some of Canon's Bubble Jet printers. As a result, some PC owners may be experience printing problems such as the printer only printing 1/2 or 3/4 pages. Here are 4 possible solutions to this problem. If these do not correct your problem please contact Canon Technical Support for assistance.

1. Printer Port Set to ECP in Device Manager

Boot Windows 95 and right click on "My Computer" icon.
Select Properties.
Select Device Manager tab.
Double click on Ports (Com & LPT).
Double click on ECP Printer port (LPT1). If your configuration is already Printer Port, this correction does not apply.
Select Driver tab.
Select Change Driver...
Select Show all devices.
Under Models: Select Printer port, then click OK.
Click OK again.
Shut down Windows 95 and Reboot.

2. Port Resource Settings Incorrect e.g. Compaq PC's

Right click on My Computer
Select Properties

Select Device Manager tab
Double-click Ports (COM & LPT)
Double-click LPT
Select Resources tab
De-select Automatic Settings
Change Basic Configuration, find the configuration that meets the following conditions.

The settings need to be set for:
Input/Output Range 0378-037?
Input/Output Range 0778-077?
Interrupt Request 07
NO DMA.

Select OK
Shut down Windows 95 and Reboot.

3. [K is printed at top of page and the rest of the page is correct.

Right click on My Computer
Select Properties
Select Device Manager tab
Double-click Ports (COM & LPT)
Double-click LPT
Select Driver tab
Look at the File Revision line, LPT.VXD v4.00.950. You will need to replace LPT.VXD v4.00.950 with LPT.VXD v4.00.503. The LPT.VXD file is
located in the Windows\\System directory.
Confirm that your CMOS (BIOS) settings are set to Standard Bidirectional

[Note: CMOS configurations can vary from model to model. Please check your owners manual or contact your computer manufacturer for details.]

4. Incorrect Port Configuration on Toshiba Laptops:

TA43620_Canon_Bubble_Jet_Setup_Information.pdf

From Windows 95 click on Start
Go to Programs
Select Toshiba Utilities
You will have either the TSETUP or HARDWARE SETUP utility
Reboot your system

For TSETUP:

Under Parallel Port select Standard Bidirectional
Reboot your system

For HARDWARE SETUP:

Select Hardware Options
Select Parallel/Printer
Select Standard Bidirectional
Click OK
The machine will ask if you want to reboot. Select Yes.
Reboot your system.

Page Fault in Win32s16.DLL

How to Interpret the "FMPRO30 caused a Page Fault on Module WIN32S16.DLL @ 0005:0632" message when running Win32s

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
After installing Win32s in your Windows 3.x system, you may receive a page fault error message that reads, "'FMPRO30 caused a Page Fault on Module WIN32S16.DLL @ 0005:0632". This message points towards a particular incompatibility with your machine and Win 32s.

Generally, there are three possible incompatibilities: video driver bios, printer driver bios and your machine's system bios. This can usually be corrected by updating the bios for the particular device driver.

Specifically, in some Dell PC- Compatible machines, the new Dell A05 bios has been known to cause Page Faults within Win 32s. However, the Dell A02 bios appears to work fine.

Setting Text Case - Proper Case, Title Case, Word Cap

This article illustrates how to automate the application of "proper" or "title" case as a text style A.K.A. "word capped."

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

ClarisWorks provides shortcuts for setting text to upper case or lower case, but not to proper case (also known as "title" case or "word capped.") A macro can be created to perform this conversion and the macro can be added to the shortcuts palette. Here are the steps:

```
Step Keystroke comment

1. Command-shift-j begin recording macro
2. Proper case enter name of macro
3. <enter key>
4. Command-c copy
5. <left arrow key>
6. Command-f find
7. Command-v paste
8. Command-w close find window
9. Command-n new document
10. s spreadsheet
11. <enter key> create
12. Command-v paste
13. <tab key> go to cell a2
14. =proper(a1) enter formula
15. <enter key> terminate editing and stay in cell
16. Command-c copy
17. Command-w close spreadsheet window
18. Command-d don't save*
19. Command-f find
20. <tab key> go to change field
21. Command-v paste
22. <enter key> perform find
23. <Change button> click the change button
24. Command-w close find window
25. Command-shift-j end recording macro
```

*Step 18 is Command-d for ClarisWorks 4.0, and Command-n for 3.0.
It's convoluted, but it works. Try it. Select a word or phrase and use the new Proper case shortcut.

DOS 3.3: Renumber fix

The Renumber program on you DOS master diskette contains an error which mistakes the number after a "*" as a line number and renumbers it.
This article has been archived and is no longer updated by Apple.
For example, if you had a line:

10 let A=B*10

it might become:

20 let A=B*20

The permanent fix is:

For RAM Applesoft	For ROM Applesoft
(DOS 3.2)	
load renumber	load renumber
poke 14342,172	poke 4815,172
poke 14343,171	poke 4816,171
unlock renumber	unlock renumber
save renumber	save renumber
lock renumber	lock renumber
(DOS 3.3)	
load renumber	load renumber
poke 14316,172	poke 4789,172
poke 14317,171	poke 4790,171
unlock renumber	unlock renumber
save renumber	save renumber
lock renumber	lock renumber

System Folder: Securing With "Secure INIT"

Do you know of any software that I can use to protect my System Folder configuration, so that users can't change it?

This article has been archived and is no longer updated by Apple.
There is a Macintosh program called "Secure INIT" that records a fixed configuration of the System Folder. An option can be enabled that restores this fixed configuration on system Shutdown or Restart. It is also possible to make the System Folder invisible to the user.

Sorting by Two Different Fields Not Printing Correctly

Two-tiered sorts will not print correctly in Claris Organizer 2.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

In Claris Organizer 2.0 you can sort by two fields and view the results but you cannot print them. For example, you may often want to sort by last name and first name. This can be accomplished by either clicking on Last Name in the Contact List then holding down the shift key and clicking on First Name, or, using the sort function from the View menu and entering Last Name as the Primary field and First Name as the secondary field. The result of your sort will show up fine in the Contact Menu but you will not be able to print this way.

Adding Music to your Documents

The following article will briefly explain how to add MIDI music to your QuickTime movies.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
While you are collecting clip-art graphics and QuickTime movies for your slide shows, you can add music files for your shows as well. You can use MIDI type music files then convert the MIDI files into QuickTime "movies".

The following steps will convert your MIDI music files to QuickTime format.

1. Launch SimpleText, choose "Open" from the File Menu, navigate to the MIDI file you want to use in your slide show, and click on "Convert".

2. Click on the Options Button to listen to the song or to change musical instruments

3. Click on "OK" and then "Save"

SimpleText will add the word "Movie" to the file name automatically and will display a Control Panel figure which offers Play, Rewind, and Fast Forward Buttons.

QuickTime is a feature of system 7.5. If you do not have system 7.5 or later, QuickTime can be purchased. To check if you have QuickTime installed, open the Extensions folder inside your System folder and look for the QuickTime extension.

Error message: This is not a ClarisWorks file or has been corrupted.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The inability to access files created with earlier versions of ClarisWorks is usually caused by a damaged "XTND Translators List" file; a file that ClarisWorks creates and uses whenever you open or import a document. Follow these steps to trash the old translator file and create a new one:

1. Quit ClarisWorks.

2. Open the Preferences folder within the System Folder.

3. Drag the XTND Translators List file to the trash.

4. Launch ClarisWorks. ClarisWorks will then check the translators in your system and create a new XTND Translators List file.

About ClarisWorks Version 4.0v5 Mac, Updater Read Me

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

WELCOME TO CLARISWORKS 4.0v5!

Thank you for choosing the ClarisWorks¨ 4.0 application. We're pleased to provide the ClarisWorks 4.0v5 Update, which has additional important features and addresses a few known issues since its initial release.

This document provides information about:

I. Installing the ClarisWorks 4.0v5 updates
II. Problems and issues addressed in v5
III. Problems and issues addressed in previous releases
IV. New features

I. INSTALLING THE CLARISWORKS 4.0V5 UPDATES

Before running the updater make sure all of your computer's System software extensions are turned off. To do this:
1. Save all open files and quit all of the programs running on your computer.
2. Hold down the Shift key on your keyboard.
3. Choose Restart from the Special menu.
4. Do not release the Shift key until the words "Welcome to Macintosh. Extensions off." appear on your screen.

To update the ClarisWorks 4.0 (v1, v2, v3 or v4) product currently installed on your computer:
1. Double-click the "ClarisWorks 4.0v5 Updater" installer icon.

2. Read the Claris splash screen and click Okay
3. Choose Easy Install (to update ClarisWorks and install all of the new v5 components except the ClarisWorks File Converter) or Custom Install (if you want to specify which components to update).
4. Verify that the "Update Location" box in the lower left corner of the Updater window lists the correct location (disk and folder name) of the version of ClarisWorks which you wish to update. If you have multiple copies of ClarisWorks, click "Select Folder" and select the appropriate folder.
Note: If the updater does not find a folder that contains ClarisWorks, go back through the steps listed above to ensure that your Macintosh is running with the extensions turned off, then try running the Updater again.
5. Click Update (or Install if you have selected a custom option that only installs files)
The updater will begin updating the application and installing updated files at the same time. Once the updater is finished, click Quit and you can begin using the updated version of ClarisWorks.

Note: To install the ClarisWorks File Converter application, you must choose it from the Custom Install list. For more on using the ClarisWorks File Converter, see the document "Read Me - CW File Converter," which is installed into your ClarisWorks folder when running the ClarisWorks 4.0v5 Updater.

II. PROBLEMS AND ISSUES ADDRESSED IN V5

This v5 Updater addresses several issues from previous versions:
*Closing documents. In v4 and earlier versions, on Macintoshes with more than 48 MB of available system RAM, closing a ClarisWorks document would cause a crash on some machines This has been fixed in v5.
*Importing Excel documents. In v4 and earlier versions, calculations in Excel spreadsheets
that contained numbers greater than 32767 imported as negative numbers in ClarisWorks. This was fixed in the latest version of the Excel translator provided with this update.
*Several stationery files have been updated to use 1997 dates where appropriate.

III. PROBLEMS AND ISSUES ADDRESSED IN PREVIOUS RELEASES

This v5 updater also addresses all issues fixed in previous releases:

* Mail Merge and Multiple Line Data. In v4, when a mail merge field contains multiple lines of text, the text now merges and prints correctly. (The text still displays as a single line on the screen.)
* Mail Merge and Sliding over Empty Fields. In v4, when there is an empty mail merge field on a line by itself, the following text moves up appropriately and prints correctly. (The text does not "slide" on the screen.)
* Rotating Library Images. In v1, some of the ReadyArt library images didn't rotate correctly. This was fixed in v4.
* Stationery Corrections. Minor changes were made to some of the stationery files.
* Address List Assistant. Minor changes were made to the Address List Assistant for better printing and on-screen display.
* New AppleWorks DB/SS and RTF filters.
* Faster Word Count
* Option left/right arrows in WP now correctly skips carriage returns and tabs (as it did in versions prior to 4.0).
* New Document dialog now displays more quickly, especially when there are many stationery files in the ClarisWorks Stationery folder.

* Word Services AppleEvent Support. In v4, it is easier to use applications that support the Word Services AppleEvent standard (such as some third party spelling or grammar checkers).

To enable the Word Services command in the Edit:Writing Tools menu of the ClarisWorks word processor:
1. Select Preferences from the Edit menu.
2. Select the Text icon.
3. Check the Word Services checkbox under General and click OK.

To select a Word Services application for use with ClarisWorks:
1. Open or create a word processing document.
2. Select Writing Tools from the Edit menu and then select Edit Word Services.
You see a dialog containing a list of all the Word Services applications for which ClarisWorks is currently configured.
3. Press the Add button.
You see a dialog listing the applications running on your Macintosh that use Word Services AppleEvent standard.
4. Select the one you want and click OK.
5. In the Word Services dialog, click OK.
A new menu item corresponding to the Word Services application you chose appears in the Writing Tools menu.

You can also use the Edit Word Services dialog to remove installed Word Services applications from the Writing Tools menu.

To use a Word Services application on a ClarisWorks word processing document, choose the appropriate menu item from the Writing Tools menu. This launches the Word Services application if is not already running. If you have text selected in the document, then the Word Services application checks the selection. Otherwise, the entire document is checked.

III. NEW FEATURES (No New Features in 4.0v5)
The previous release, 4.0v4 added several new features, including:
* New picture and layout in the ClarisWorks splash screen.
* Macintosh Drag and Drop Support. Users can use Macintosh Drag and Drop (that comes with System 7.5) to move text, graphic objects, and spreadsheet cells within ClarisWorks 4.0 documents, drag selections from one document to another, drag selections to other applications (including creating clipping files in the Finder).
* Backwards File Conversion to 2.0/2.1/3.0 Formats. You can use the new ClarisWorks File Converter application to save version 4.0 files in the format used by ClarisWorks versions 2.0, 2.1 and 3.0. For more on the File Converter, see the file "Read Me - CW File Converter".

* New filter for WordPerfect 3.1 for Macintosh.

Claris and the ClarisWorks team thank you for your purchase of ClarisWorks 4.0. Your support, comments, and suggestions help us to continue to bring you better solutions for your future productivity needs.

Cannot Find a Contact if the Company Name Starts with "The"

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you have a contact with a company name that started with "the", such as "The main company" you will not be able to find this company using a Find.

The workaround is to click on the more choices button located in the find dialog box , select the company field and enter the find criteria , such as "The main company".

Deleting Messages in Auto-File Log deletes Messages

When looking at the Auto-file Log and you delete a message, it will actually delete the message.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

If you are looking at the Auto File Log and a message is highlighted, if you click on the delete key, the message will be deleted, by being moved to the deleted mail folder.

Using AppleShare to Share Your User Dictionary Across a Network

When you have many people on a network it can be very valuable to share a common user dictionary.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
This article requires that you have a basic understanding of how to share files via AppleShare.

When you have many people on a network it can be very valuable to share a common user dictionary. That way words that are commonly used, like your company name or a product name, only have to be entered once.

Here's an easy way to set this up:
The first thing you need to do is to decide who will host the dictionary and go to that computer
Create a folder named "Shared" and allow sharing of it's contents
Open your applicatio
From the Edit menu select Spelling then Select Dictionaries*
Make sure that User Dictionary is chosen from the pull down menu
Click on New
You can name your new dictionary "Shared Dictionary" and save it in your new Shared folder
Now move to another computer
Go to your Chooser and mount the volume that has the Shared folder
Open your application
From the Edit menu you can select Spelling then Select Dictionaries
Now you can select the Shared Dictionary from the Shared folder that you mounted via AppleShare

Now you are sharing the dictionary and any changes you make will effect everyone who is also using this dictionary.

* For ClarisDraw select Spelling from the Edit menu then Install Dictionaries. For ClarisWorks select Writing Tools from the Edit menu, then Select Dictionaries

AppleTalk: Network Manager Status Program

Do you know of any product that updates software installed on local workstations through the network? This should act somewhat like Responder and Inter-Poll except that the workstation software can actually be updated. Also, the program should be able to do an analysis on each workstation and summarize the results in report form.

For example:

System 1: (ZONE: Finance)
MS Word ver 3.01
MacWrite ver 1.1
Finder ver 6.0.5
LaserWriter ver 6.0.1 ...etc..

System 2: (ZONE: Sales)
MS Word ver 4.0b
MacWrite ver 1.0
Finder ver 3.2
LaserWriter ver 4.1 ...etc..

.
.
.

System n (ZONE: Engineering)
MS Word ver 3.01
MacWrite ver 1.1
Finder ver 6.0.5
LaserWriter ver 6.0.1 ...etc..

Summary:

2 MS Word ver 3.01
1 MS Word ver 4.0b
2 MacWrite ver 1.1
2 Finder ver 6.0.5

This article has been archived and is no longer updated by Apple.
We don't know of a package that does updates, but there is a package to be released in July, 1990 from Pharos called System Status Mac. It acts like Inter-Poll and investigates workstations on the network, responding with the version numbers of software. The System Manager can then compile the results and advise users when upgrades are available.

For more details, search the Tech Info library under "Pharos Technologies, Inc."

Two-sided Printing

There are ways to print on both the front and back of your paper.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Issue: How do I print on both the front and back of my paper?

Answer: Claris software, such as ClarisWorks and FileMaker Pro, do not have built-in capabilitiy to support two-sided printing. However, there are ways to achieve two-sided printing from almost any program.

1- You can print single-sided from your computer and make two-sided copies with a photocopier.

2- You can print the odd-numbered pages one at a time, then reinsert these pages back into the printer and print the even-numbered pages, again, one at a time. When reinserting the pages into the printer, the correct order and position will vary depending on your printer.

3- If you have an HP DeskJet 800 Series printer, you can use the version 9.1 printer driver. This driver has an option in Page Setup that automates two-sided printing. To update your printer driver, call HP. Or, you can download this driver from the Hewlett Packard Web site at http://www.hp.com or from their forum on America Online (keyword: hp). Some other drivers may have this option, check with your printer manufacturer for the latest version.

TIP: When printing two-sided copies, you may want to go to the Documents command and click the checkbox for "Facing Pages". This changes the Left/Right margin controls to Inside/Outside margin controls.
TIP: When printing two-sided for a book, the odd numbered pages are on the right.

4- If you have a printer other than the DeskJet that uses a driver without two-sided printing support, you can purchase ClickBook (for Macintosh.) ClickBook adds two-sided printing to almost all Mac programs and is supported by most printers.

The same company that does ClickBook also has a Windows version named:
WebPrinter 2.0 for Windows 3.1 and Windows95

WebPrinter will instantly turn your valuable Internet, CD-ROM and Windows data into attractive booklets with WebPrinter. With only two clicks, sports stats, custom travel itineraries, financial "how-to" guides, product literature, maps and even photos are transformed into convenient, double-sided booklets.

Features: Rotates, reduces & realigns documents automatically
Walks you through double-sided printing
Works with any laser or inkjet printer
Saves your documents for offline printing
Available for Windows 3.1 and Windows95

Black Dialog Boxes and Redraw Problems under Windows 95

Several Claris applications may exhibit strange video behavior when used in conjunction with the Stealth GT drivers from Diamond Multimedia. This article explains the compatibility problem as well as something to fix it.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If you are using the GT drivers for Windows 95 supplied by Diamond Multimedia Systems with any of the following video cards:

Stealth SE
Stealth 64 VRAM
Stealth 64 Graphics 2000 series (Stealth 64 DRAM is included in this series)
Stealth 64 Video 2000 series
Stealth 64 Video 2001 series
Stealth 64 Video 3000 series

the following Claris applications may exhibit strange color distortion and/or screen redraw problems.

ClarisWorks, ClarisImpact, and ClarisDraw will display blacked-out New Document dialog boxes, as well as other blacked-out menu items and dialog boxes. In some cases the documents themselves will be black.

FileMaker Pro 3.x will display mouse trails, mouse droppings and lines on the screen when moving anything in Layout Mode. Forcing a screen redraw (zooming in and zooming out, minimizing the screen, or switching to another layout and back again) will clear up the problem until something is moved or resized in the layout.

You can tell if you are using the Diamond GT drivers in several ways. The easiest way is to see if you have the InControl Tools icon in the notification area of your Windows 95 Taskbar (a diamond-looking icon located near the clock). Or, you can look in the Control Panel at the DISPLAY properties to see what driver you are currently using. To do this, do the following:

- Click on the START button, point to SETTINGS and then point to CONTROL PANEL
- In the Control Panel window, double click on the SYSTEM icon
- In the System Properties screen, click on the DEVICE MANAGER tab at the top
- Locate the DISPLAY ADAPTERS item and click on the plus sign next to it
- The information listed under Display Adapters is the video driver you are currently using.

There are several solutions and workarounds to this problem:

1) Diamond has an ALPHA driver on their FTP site that fixes the problem with ClarisWorks, ClarisImpact, and ClarisDraw. The alpha drivers DO NOT fix the problem with FileMaker Pro. Diamond's FTP address (as of the writing of this article) is ftp://ftp.diamondmm.com. There are complete installation instructions included with the driver from Diamond. Note that since these are still alpha drivers, it means they have not been officially tested, certified and released by Diamond. More information about this is also included with the driver.

2) You can use the Diamond-specific drivers off of the Windows 95 CD-ROM. These drivers are located in the \\DRIVERS\\DISPLAY\\DIAMOND folder on the Windows 95 CD (upgrade or retail version) or in the \\DRIVERS\\DISPLY\\STEALTH folder on the Windows95 OEM version CD ("For Distribution Only with a New PC") . There is a README text file as well as an INSTALL text file that you can consult for more information on these drivers -- including detailed directions on how to install them. Using these drivers will fix ALL video related problems when using a Stealth video card and ANY Claris application listed above. You will lose any functionality you might have had when using the InControl Tools supplied by Diamond. The InControl Tools DO NOT work with non-GT drivers.

3) You can contact S3 Incorporated (they are the makers of the accelerator chip(s) used on the Stealth line of video cards) and download the drivers for the specific chipset your card uses. As of the writing of this article, S3 can be reached on the Internet at http://www.s3.com.

These errors are caused by a compatibility problem between the GT drivers and Claris applications. While this might appear to be a Claris related problem, it is actually a problem with the GT drivers as other non-GT drivers have been proven to work successfully.

Contact Diamond Multimedia for more information on Stealth compatibility and driver availability.

AppleScript to Open Web page on Internet Explorer

AppleScript to open Web page on Internet Explorer

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Here is a new script for Claris Organizer to access the Internet Explorer:

Open the "Open Netscape to URL" AppleScript document located in the "Claris Organizer Scripts" folder included in the "ClarisOrganizer 2.0" folder.

Change or edit the script to read:

```
tell application "Claris Organizer 2.0"
set strURL to Button Field of contact 0
end tell

tell application "Internet Explorer 2.1"
Activate
CancelTransaction 1
OpenURL strURL
end tell
```

Published Date: Feb 18, 2012

Error Message: "A script error has occurred. There may be not enough memory to launch the application, or it may have a dialog up."

International ClarisWorks and Claris Organizer US have trouble writing letters.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If you have an international version of ClarisWorks installed on your computer and you are using Claris Organizer 2.0 you may get this error message "A script error has occurred. There may be not enough memory to launch the application, or it may have a dialog up."

This error message will occur when you open Claris Organizer, display a contact card and click on the attach letter button located on the address section area.

Solution:
Open the "ClarisWorks Letter Link" AppleScript document located in the "Claris Organizer Scripts" folder included in the "ClarisOrganizer 2.0" folder.

Locate the following instruction in the "-- handle secondary version number" section of this script :

set versionNum to (majorVersionStr * 100) + versionNum

Enter two dashes in front of this sentence, then save and quit the ScriptEditor. This will prevent this error message .

--set versionNum to (majorVersionStr * 100) + versionNum

TA43637_K_INIT_Use_with_System_or_Earlier_(TIL05712).pdf

800K INIT: Use with System 6.0.3 or Earlier

Was the 800K INIT fix included as part of System 6.0.3 (and later) software? Is it part of the System file? I can't find an INIT file called 800K INIT.

This article has been archived and is no longer updated by Apple.
You do not need to use the 800K INIT with System Software 6.0.4 or later because its equivalent is built in--it's actually part of the System file.
However, you do need to install it on Macintosh computers with 800K drives when using System Software 6.0.3 or earlier.

When is a PICT not a PICT?

There are differences between Pict files....

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
PICT files are object-based files. That is, they can contain distinct geometric objects, such as lines, rectangles, circles and polygons. Another type of object that a PICT file can contain is a bitmap object.

When you save as a PICT file from a bitmap / paint program, such as Adobe Photoshop or GraphicConverter, you're saving out a PICT file with a single bitmap object. You're not saving out a PICT file that contains distinct objects. Since the entire drawing is a bitmap object, it will only be editable with bitmap editing tools.

Shopping for an Internet Service Provider (ISP)

A checklist for checking out Internet Service Providers and a short list of national Internet Service Providers

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Note: To search for Internet Service Providers, go to the web site at
http://thelist.iworld.com/

Checklist
When you're setting up a Web site, there are several technical and economic considerations to keep in mind. The following is a checklist of basic requirements for a PPP (Point to Point Protocol) Internet account which will allow you to post your Web pages.

Note: When creating or editing pages with Claris Home Page, you don't need to be online or even have an Internet account. Using Claris Home Page does not necessarily cause you to incur charges from your Internet service provider (ISP).

1. Does the provider have a local access number?
You shouldn't have to pay for toll calls to access your account. Although some providers have a toll-free 800 number, there may be extra charges to use this 800 number.

2. What's the number of and speed of the modems they utilize?
Ask them how many clients they have per modem; a 10 to 1 ratio is usually sufficient. If their modem pool uses anything slower than 28.8k baud per second modems, look elsewhere.

3. Do they bill by metered time or do they offer a flat rate?
A flat rate for access is increasingly common and usually a superior value. Estimate how much time you'll be online each month before you sign up with any service. If you're planning 40 hours of Web surfing, the $8.00 plan with $1.00 hourly charges will cost you almost $50.00 at the end of the month. Most flat rate plans are below $30.00 per month.

4. Setup fees?
Some ISPs charge a one-time setup fee while others do not. Be sure to inquire before signing up.

5. How much Web server space do they offer their users?
For others to view your Web site, it must be on a Web server. This should be included in the price of the account. For a personal Web site, 5 megabytes is usually sufficient. However, the more space you get, the better. If you plan on operating a small business Web site, 20MB is a good starting point.

6. What connection software and support do they offer?
Your ISP should provide you with the basic tools necessary to connect to the Web. They should also be happy to mail this software to you on floppy disks if you have no means of downloading it. Their technical support staff should be prepared to walk you through installing and configuring your setup.

Special note to Macintosh users: ask specifically about Mac support while shopping for an ISP. Many outstanding support departments have only Windows agents. Be sure your platform is well supported before you make a commitment.

7. Do they offer access to CGI scripts?
You may want to implement forms, image maps or counters to track visits to your site. These require the use of Common Gateway Interface scripts. Rather than learning how to program CGI scripts yourself and then uploading them to your site, many providers allow you to access their preexisting scripts. If you plan to add a high level of interactivity to your site, seek a provider with plenty of scripts at your disposal. If you plan to write your own CGI scripts, be sure the provider you select will allow you to upload and use them. Some ISPs do not allow the use of outside CGIs for security reasons.

Listing of a Few National Providers
HoloNet (510) 704-0160 www.holonet.net
MindSprint (800) 719-4332 www.mindspring.com
Delphi (800) 695-4005 www.delphi.com

Netcom (800) 353-6600 www.netcom.com
Earthlink (800) 395-8425 www.earthlink.com
PSI (800) 827-7482 www.psi.com

OfficeMail: Listing of a Few National Providers which provide UUCP type of accounts

UUNet (800) 488-6383 www.uunet.com
Netcom (800) 353-6600 www.netcom.com
Supernet (303) 296-8202 www.sni.net
Teleport (503) 223-0076 www.teleport.com

Mention of these providers does not imply an endorsement by Claris. This information is provided simply for your convenience.

If you have authorized Web access from someplace else (at work or a friend's house, for example) you can look for a provider using a search service from iWorld. This service can help you locate smaller providers in your area. The small providers are usually quite competitive and it's definitely worth your while to investigate them. This service is located at:

Apple Tape Backup 40SC: Third-Party Backup Speeds

Using Apple Tape Backup 40SC 2.0.1, what is the average access time for the drive if a user has it mounted on the desktop?

This article has been archived and is no longer updated by Apple.
By "average access time", we assume that you mean the average transfer rate. Measuring the average access time for a tape drive would make little sense, since it's not a random access device. If one were to test this, it could take a very, very long time.

Apple does not publish any official numbers for this specification, but we were able to achieve .95MB per minute using Tape Backup 40SC version 2.0.1. This rating was calculated without the time required to rewind the tape at the beginning and end of the backup. Only the speed of writing to tape for a 20MB volume backup was used.

Backing up files is considerably slower and varies depending on the sizes and numbers of files. Third-party backup programs that are compatible with our tape drive are faster in file-by-file mode than Tape Backup 40SC 2.0.1.

Tape Backup 40SC cannot be mounted on the desktop. The Tape Disk INIT was designed solely for single-file recovery from backups created with the volume backup option. It was not created to provide another backup option, and will not perform this function, unless a volume backup already exists for it to work with. This is documented in the "Apple Tape Backup 40SC Owner's Guide."

SuperMac Technologies has released their equivalent of Tape Disk named TapeDriver. It appears to work with the Apple Tape Backup 40SC to allow mounting the tape on the desktop, even if the tape doesn't contain a volume backup. It is not compatible with Tape Backup 40SC 2.0.1 volume backups, though, and asks to erase any tape inserted that contains one. The INIT is available on AppleLink by following this path:

3rd Party Connection
Third Party Software Updates
SuperMac
Mass Storage Support Files
TapeDriver

The two programs that we tested and found to be compatible with the Apple Tape Backup 40SC are Retrospect (Dantz Development Corp) and FastBack II (Fifth Generation Systems, Inc). Contact their vendors for more information. For more details, search the Tech Info library under company names for details.

Illegal Operation Error in Module COMCTL32.DLL when Switching into Edit Page Mode from Preview Page Mode

Here's what to do when you receive this error message: "an illegal operation error has occurred with an invalid page fault in module COMCTL32.DLL."

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If you receive this error message "an illegal operation error has occurred with an invalid page fault in module COMCTL32.DLL.", when switching to Edit Page mode from either Edit HTML Source or Preview Page mode in Claris Home Page, it is usually the result of an incompatibility with the video driver that is installed in your Windows 95 machine. Sometimes, however, the issue may be with an incompatible printer driver instead.

In either case, you need to install a more compatible video or printer driver from the Windows 95 CD or diskettes that came with your system.

To install a video driver:
1] select the Start menu
2] choose Settings and then Control Panel
3] double click on the Display icon
4] click on the tab that is labeled settings
5] click on change display type and select change under adaptor type
6] click on the radio button that reads show all devices

To install a print driver:
1] select the Start menu
2] choose Settings and then Printers

3] if you have more then one printer listed, you need to remove them all by highlighting each of them individually and selecting Delete from the File menu
4] double click on the Add Printer icon and follow the prompts when you click Next

Note: It is recommended that before installing or reinstalling a printer or video driver in your system, you know the manufacturer of your video card and printer. This will make installing the different driver easier because Windows 95 has drivers listed for just about every company manufacturer.

This article can be used for troubleshooting any error message that refers to the COMCTL32.DLL file.

Conflict with RAMDoubler and Kensington

Software conflicts can involve more than one extension/control panel, often with older versions of software utilities

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

It was reported what was thought to be a conflict between RAMDoubler and ClarisWorks 3.x and 2.x. Neither application would launch while RAMDoubler was active. When the Kensington Turbo Mouse software was updated to version 4.02 or later, both versions of ClarisWorks launched with RAMDoubler enabled.

Cannot Scroll Through Appointments with Multiple Event Banners

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

1. Open to "Monthly" calendar view
2. Create 3 or 4 appointments for a specific date. Notice that you can scroll through the appointments.
3. Add 2 or 3 "Event Banners" to the same date. In the event that you cover up all of your appointments with event banners, you will not be able to access your appointments.

Event banners are different from the Special Events of Claris Organizer 1.0 in that they are not scrollable.

Workaround is to view your appointments in the Weekly or Daily view.

ClarisWorks: DOS 21 Error when Using Win32s Based Applications

This article outlines some of the causes of a DOS 21 error and the steps you can take to possibly correct them.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Microsoft Win32s is a system extension that allows specially designed 32-bit windows applications to function and run in Windows 3.x or Windows for Workgroups 3.x which are 16-bit operating systems. In other words, Win32s enables Windows 3.x or Windows for Workgroups 3.x machines to emulate 32-bit mode.

Since Win32s runs Windows 3.x and Windows for Workgroups 3.x in a state Windows was never truly designed to run in, problems may arise. One such problem is a DOS 21 error. This error is a generic error indicating that Windows is having problems running your Win32s based application.

You will want to follow the steps below if you attempt to launch your Win32s based application and get any or all of the following error messages:

Win32s - Error: At least one system component is out of date. Please reinstall C:\\FMPRO30\\FMPRO30.EXE

Win32s - Error: Initialization of a dynamic link library failed. The process is terminating abnormally.

Unexpected DOS error 21

Application Error: Call to Undefined Dynalink

Depending on when you get this error will determine what path you take to try and resolve this. Please follow the proper path listed below.

YOUR WIN32S BASED APPLICATION USED TO WORK BUT NOW IT DOESN'T

If your Win32s based application, such as FileMaker Pro or ClarisWorks used to work but then suddenly stopped working, it is normally caused by another application or program installing older versions of files that are vital to the proper functioning of Win32s. To verify this you will want to perform the following steps:

1. Search for the files listed below and delete them from every directory EXCEPT from the \\WINDOWS\\SYSTEM

COMPOBJ.DLL 109056 9/6/95
OLE2.DLL 304640 9/6/95
OLE2CONV.DLL 57328 8/14/95
OLE2DISP.DLL 165008 7/25/95
OLE2NLS.DLL 152976 7/25/95
OLE2PROX.DLL 51712 9/6/95
STDOLE.TLB 5472 7/25/95
STORAGE.DLL 157696 3/2/95
TYPELIB.DLL 177824 7/25/95

The file size and date are taken from the files installed by the latest version of Win32s which is 1.30c. If you are using an older version of Win32s your file sizes and dates may vary. It is highly recommended that you obtain the latest version of Win32s if you are using an older version. It is also possible that you will encounter files whose dates is newer than the one listed above. This is usually OK --- the older ones are generally the problem.

2. In the \\WINDOWS\\SYSTEM directory, rename all the files listed above so that they have a .130 extension. Backing up the files ensures that if something goes wrong you can restore your system to the way it was before you starting troubleshooting this error.
3. The next step requires editing the SYSTEM.INI file. Open it up in any text editor, like NOTEPAD or SYSEDIT, and modify the following line from the [BOOT] section

DRIVERS=MMSYSTEM.DLL WINMM16.DLL

So that you remove the reference for WINMM16.DLL. The line should look like this when your doneÉ

DRIVERS=MMSYSTEM.DLL

4. Also in the SYSTEM.INI, remove the following line from the 386 Enhanced [386Enh] section of the SYSTEM.INI file:

Device=c:\\windows\\system\\win32s\\w32s.386

5. Save the changes to your SYSTEM.INI file
6. In the File Manager or equivalent , delete the entire WIN32S directory --- which is located in the \\WINDOWS\\SYSTEM subdirectory.
7. Quit out of Windows and restart
8. Delete the following files from the \\WINDOWS\\SYSTEM sub-directory

W32SYS.DLL
WIN32S16.DLL
WIN32S.INI
WINMM16.DLL

The above changes will take effect the next time Windows is run.

9. Reinstall Win32s per the directions that came with your application or from the directions that came with Win32s (if you downloaded it.)

After reinstalling Win32s, try your Win32s based application again and see if you can reproduce the errors you were getting. If the errors go away, then your system is fixed and your system should still function normally. If you continue to get any of the errors listed in this article, please see the section entitled:

YOUR WIN32S BASED APPLICATION HAS NEVER WORKED PROPERLY

If you just installed your Win32s application and immediately got one of the above errors, then another conflict is going on in your machine that is beyond the capacity of Claris Technical Support to assist you with. In this case one of two things is happening

1. There is another file or application on your system conflicting with the proper operation of Win32s
2. Your systems hardware, for one reason or another, is not compatible with Win32s.

It may be worthwhile to try uninstalling and reinstalling Win32s from your system, especially if you think you might have had a previous version of Win32s already installed. Please follow the directions listed above to see if it makes a difference.

To determine if you have a conflict with another file or application already installed on your system, you can try to reinstall Windows in another directory and see if that makes a difference. You can install Windows in another directory so that you do not effect your original configuration. Once you install Windows in another directory (for example \\WINDOWS2), launch that version of Windows and install Win32s and your Win32s based application into the new version of Windows.

If running your Win32s based application in the new version of Windows solves the problem, that indicates there is a configuration/compatibility issue between your original configuration and your Win32s based application. It is recommended that you use your new version of Windows and install all your Windows applications into this new version of Windows. Once you have confirmed that everything is running properly and/or has been copied over properly, you can delete your original version of Windows.

If the new version of Windows also produces the errors listed above then your system is having a general compatibility problem with Win32s. It is unlikely, without some hardware changes that you will be able to run your Win32s based application. At this point, you should contact that manufacturer of your system to see if they can offer any advice in running Win32s based applications.

Datapen Bar-Code Reader

I need a lightpen to read bar-code data that will be stored in a 4th Dimension or Foxbase database. Do you know anything about?

This article has been archived and is no longer updated by Apple.
Datapen is a computer-keyboard interface device used for decoding and entering data via bar codes. Bar-coding can be incorporated into any type of computer terminal or point-of-sale system. There is no need to change the system software, because Datapen emulates the existing keyboard and is completely transparent to the programs in use.

You don't need a decoder, since Datapen itself is a decoder device. The system thinks all the data is entered from the keyboard. To the existing programs, Datapen is invisible.

Contact pen readers, laser scanners, badge readers, CCD scanners, and most other types of intelligent, RS-232, input devices work with Datapen. Datapen supports the following bar-code readers/scanners:

- All Datalogic standard readers
- Pens P10, P31, P32, P40
- Laser hand-held scanner LS8110, DL4100, and DL4200
- CCD hand-held scanner DL60 series
- Slot reader SR11

Datapen supports UPC/EAN, 2/5/5 bars, Code 39, Codabar, 2/5 Interleaved, 2/5, ABC Codabar, MSI, Plessy, Code 32, Code 11, UPC A/E Add on code, 2/5 Datalogic, EAN/LAC, 2/5 Industrial, Delta IBM, Code C.I.P., Code 93, and Code 128.

Datapen installs between the computer and the keyboard. The keyboard cable from the Macintosh is plugged into Datapen, and the Datapen cable is plugged into the computer keyboard.

Apple Computer Model	Datapen Model
Macintosh, Macintosh Plus	DPA-04
Macintosh SE, II, Apple IIGS	DPA-03

Microsoft Office Launches ClarisDraw Without a New Document

ClarisDraw will not create a new document when launched from Microsoft Office.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Microsoft Office places a "pencil" icon near the Finder icon. One of the features of this icon is opening other applications both Microsoft and other. When you open ClarisDraw with this feature, it will not open a new document.

Steps to reproduce:
1) Go to the pencil icon on the top of the screen next to the Finder icon
2) Click on the pencil to and go to the Customize menu
3) Click New, Go to ClarisDraw and launch

ClarisDraw launches but will not open a new document. Workaround is to open ClarisDraw directly from the application icon or the Recent Applications menu.

Unexplained Menu Behavior and Minimized Application Window with ClarisWorks 4.x

The System Registry is the main database file for Windows 95, and from time to time entries within the Registry can become corrupt and cause issues with Windows 95 applications, including ClarisWorks 4.x.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If you encounter either of the following issues when using ClarisWorks 4.x, it is most likely caused by a corrupt entry in the System Registry:

-- Launching ClarisWorks 4.0 causes the application window to appear automatically minimized. ClarisWorks will appear in the Taskbar, and attempts to restore do not work. Double-clicking on a ClarisWorks file from the Explorer will also appear minimized, with the name of the ClarisWorks document showing up in the Taskbar.

-- Unexplained menu behavior, including not being able to see the menus (they are off the screen), or the menu commands themselves are unreadable.

If you encounter either of the above symptoms or other unexplained behavior in ClarisWorks 4.x, it is recommended that you delete the ClarisWorks for Windows section from the System Registry and restart ClarisWorks for Windows. Doing so will rebuild the contents of the System Registry and will allow your application to function normally once again.

ClarisWorks 4.0 for Windows 95 uses the Windows 95 System Registry to store information about the application as well as configuration parameters. The Registry is the central information database for Windows. Due to the importance of this file, great care must be taken when editing / modifying this file. It is recommended that only experienced users attempt to edit the Registry. It is also advisable to backup the Registry database before making changes. The Registry can be saved (exported) in text format as a .REG file by using the Registry Editor (REGEDIT.EXE). The Registry can later be restored (if necessary) by importing a .REG file that was created by exporting the Registry. Please consult your Windows 95 documentation for more information on the Registry Editor and backing up it's contents. Please do not attempt the following Registry edits if you are not comfortable doing so.

Editing the Registry to fix the issues mentioned above:

1. Close all open applications.
2. Click on the START button on the Taskbar and choose RUN.
3. In the OPEN dialog box, type REGEDIT and click OK.
4. In the REGISTRY EDITOR, double click on the HKEY_CURRENT_USER folder.
5. Under HKEY_CURRENT_USER, double click on the folder entitled SOFTWARE.
6. Under SOFTWARE, double click on the folder entitled CLARIS CORP.
7. Under CLARIS CORP., click once on the CLARISWORKS FOR WINDOWS folder.
8. With CLARISWORKS FOR WINDOWS highlighted, press the DELETE key on your keyboard.
9. Confirm that you want to delete the highlighted key.

Once you have deleted the ClarisWorks section of the Registry, close the Registry Editor (select EXIT from the REGISTRY menu) and relaunch ClarisWorks.

Avery Label Sizes Not Available For New Database Layouts

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks has a number of preset label configurations that allow you to easily set up a label layout in your database file for use with popular Avery label sizes.

These label sizes are normally accessed by selecting the Label radio button in the New Layout dialog box and then clicking on the pop-down list to choose the desired Avery label.

Sometimes, when clicking on this pop-down list, "Custom" will be the only option and none of the Avery sizes will be listed. There are three situations that can cause this to happen:

1. The ClarisWorks Labels file has been deleted from your computer's hard drive.

Use the Macintosh Find (or Find File) command (under either the File or Apple menus) to search for "ClarisWorks Labels" (without the quotes). If you locate a file, read #2 and/or #3 below to correct the issue. If you do not have this file on your computer, you will have to reinstall ClarisWorks in order to access the Avery formats.

2. The ClarisWorks Labels file has been moved to an improper location on your hard disk.

This file must be located either within the Claris folder, which is within the System folder; or within the same folder as the ClarisWorks program. If your ClarisWorks Labels file is in a location other than one of these, move it to either of these locations.

3. The ClarisWorks Labels file has been converted to something other than a Simple Text (or TeachText) file.

This file is used by the ClarisWorks program internally and is not meant to be opened directly (if you have a lot of experience with ClarisWorks you may want to edit this file to include additional label configurations, but this is not recommended). If the file has been inadvertently opened and saved using a word processing program other than Simple Text or TeachText (such as ClarisWorks or MacWrite Pro), it will no longer be accessible in your database. To correct this issue, either delete the file and reinstall ClarisWorks, or open the file and use the Save As command to save a copy of the file in Simple Text or TeachText format. Be sure to name the file "ClarisWorks Labels" (without the quotes) and to put the file in one of the locations outlined in #2 above.

NOTE: ClarisWorks 1.0 does not have any preset label configurations

Published Date: Feb 18, 2012

Converting Various Graphic Files to Macintosh PICT Files

I want to transfer DigiPaint (HAM format) and Professional Paint (some type of encapsulated PostScript) files from an Amiga 2500 series computer to the Macintosh. (I don't think they care about the format.) Do you have any suggestions?

This article has been archived and is no longer updated by Apple.
"PICTure This" from FGM Software is an application and DA that converts a wide variety of graphic file formats to PICT and PICT2 formats. Professional Paint should also provide the Amiga IFF format. FGM has indicated that Amiga EPSF files are different than Macintosh EPSF files, and they do not support the Amiga format at this time.

File Formats

Targa 8, 16, 24, 32
CGM
PCX (all varieties)
TIFF (all varieties)
LetraSet RIFF
Amiga IFF (except the 24 bit)
Amiga HAM
RIFF
X11 Bitmaps
Dr. Halo Cut (with palette support)
SunRaster Images (B&W and 8 bit)
CompuServe GIF
CompuServe RLE
GEM IMG (PC and Atari)
Lotus PIC
Lotus BIT
Lotus RLE
MacPaint
Macintosh EPSF (due to variations, most other platforms are not supported)

For more details, search the Tech Info library under "FGM Inc."

DEMOWeekly Preview of ClarisWorks for Kids (Vol 2, #6, 2/24/97)

Claris Pushes Deeper into Education Market

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Claris is readying a specialized version of ClarisWorks that has been adapted for the educational market and children in kindergarten through the fifth grade (ages five through 11). Called ClarisWorks for Kids, the new application is based on ClarisWorks but contains a number of modifications that make it useful for schools that offer Windows or Macintosh-based computer education for their students.

Over the past two years, Claris has been quietly gaining ground in the education market, and ClarisWorks is becoming the program of choice for middle-school computer education projects nationwide. ClarisWorks for Kids is interesting because of the approach the developer has made in order to adapt a "grown up" integrated software package for young students. The company hasn't "dumbed down" the software, but instead has added features that make it more appropriate for a classroom setting. The core elements of this program are password protected so that teachers can unlock new features as they are needed. ClarisWorks for Kids contains a special Internet launching tool that works with Navigator or Internet Explorer and which can be used to easily connect to a Claris Web site designed for kids. And the program has a speech-to-text generator that makes it easy to use for the youngest students, as well as those with learning challenges. Changes to the interface design also help youngsters learn basic skills needed to work effectively with software applications.

Claris establishes a strong example in leveraging a core competency into new markets. Unlike other software companies who are trying to take old products into new markets (usually by altering pricing and packaging), Claris stands apart in its efforts to make a horizontal product suitable for a somewhat vertical market by first examining and understanding the unique needs of that market.

International Dialing Adds Extra Characters

Extra characters will be added to international numbers when confirming the dialing

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If you have your dialing preferences set to confirm a phone number before dialing, you might notice some extra characters on international numbers. If you have the phone number on the contact card set with a preceding "+" and the preferences set to start International dialing with 011 then the dialing string will look like:

011 "extra character" 4412341234

This is a known issue, current workaround is to dial without confirming numbers.

AFP Passwords and User Authentication Methods

Are AppleShare File Server user passwords stored in the Users and Groups file in an encrypted or unencrypted form? If encrypted, what is the algorithm? If encrypted, is the encryption key stored on the server volume?

It is my understanding that in the Random Number Exchange method for user authentication, user passwords are never transmitted over the network unencrypted. Is this correct?

This article has been archived and is no longer updated by Apple.
It is true that passwords are not encrypted in the Users and Groups file on the server. The theory is that the file is not accessible over the network and that a server requiring security can be locked away from prying eyes and software.

You are correct in stating that the Random Number Exchange method of user authentication does not send a password over the network unencrypted. Be aware that some third-party AFP servers may not support this method (although it would be unusual), and the user has no control over what user authentication method is used. The server being connected determines this. For a more detailed description of user authentication methods available through the AppleTalk Filing Protocol, read "Inside AppleTalk" pages 13-28 through 13-30.

Macintosh: Application Launch Time Depends on Amount of RAM

When launching FileMaker II (Macintosh IIci, Internal HD80 SC, 8MB RAM) under the Finder, it takes twice as long as under MultiFinder. I've tried it with and without the video card and had the same results. I've also tried it with a Macintosh IIcx, and it took approximately the same time to launch under Finder and MultiFinder. Can you explain?

This article has been archived and is no longer updated by Apple.
We were able to reproduce these results on a number of systems, and it seems to be based on the amount of memory available to the application. Launching FileMaker II in a 6MB MultiFinder partition takes significantly longer than in a 2MB space. When the application launches, it checks the space available to it, and prepares it for its own use. It is also possible that more resources are preloaded into available memory. We found the same to happen with a number of applications, including Microsoft Word.

You didn't mention how much RAM was in the Macintosh IIcx that you tried, but we suspect that it has 2MB or less. This would explain why the launch time under Finder was close to that under MultiFinder. Launching FileMaker II under Finder on an 8MB Macintosh IIx took 50% longer than on the same system in a 512K MultiFinder partition.

How to "Hide" an Application using AppleScript

An example of how to hide FileMaker Pro as if you had chosen "Hide FileMaker Pro" in the Application Menu

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

It is possible to hide an application (and it's open windows) by selecting "Hide [appname]" from "the application menu" in the menu bar. The application menu is the right-most menu, to the right of the help menu, and is always present.

However, it may be desirable to script the hiding of an application. The following AppleScript can be used in various situations to aid in this automation. In FileMaker Pro, this can be used in a "Perform AppleScript" step in a ScriptMaker script.

```
tell application "Finder"
set visible of process "FileMaker Pro" to false
end tell
```

Not Recognizing an Application when Selecting it for "Send Apple Event"

What to do when the selected application shows up as "<unknown>" after you specify the application

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

When constructing a "Send Apple Event" script, you will sometimes need to specify an application to send the event to. When FileMaker Pro shows you a dialog box to select an application, it only shows you those applications that can accept Apple Events.

Issue

After you select the proper application, the name of that application should appear to the right of the words "Target Application". However, if the Target Application name appears as "<unknown>" even after you select an application, the desktop file may be damaged.

A Solution

Restart the Mac, holding control and command down until you are prompted about rebuilding the desktop. After rebuilding the desktop, try to specify the same application. After specifying the application, it's name should appear as the "Target Application".

CompuServe New Mail System, Customers Cannot Go Back to Old System

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Customers having issues with the New Mail system on CompuServe who request to go back to the old system are currently being told that there is no way to go back. CompuServe is aware of continuing issues with the New Mail system and investigating ways of getting people back to the old system.

The following is a statement from CompuServe's online support:

We are aware of this issue, and we are in the process of correcting it. Unfortunately, we do not have an exact time as to when it will be corrected.

Unfortunately, we do not have a way to transfer you back to the Old Mail system at this time. We are currently looking into a way to do so, but an exact date is not available. You will want to watch the "What's New" message for further information. I apologize for the inconvenience that you have been caused.

Microsoft¨ Compatibility Tool Version 1.0 for Windows NT¨ Workstation 4.0

The Microsoft Compatibility Tool Version 1.0 for Windows NT Workstation examines the hardware on your computer and tells you if your computer can support Windows NT Workstation 4.0. It also provides you with a summary of detected hardware.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Microsoft Compatibility Tool Version 1.0 for Windows NT Workstation 4.0

The Microsoft Compatibility Tool Version 1.0 for Windows NT Workstation examines the hardware on your computer and tells you if your computer can support Windows NT Workstation 4.0. It also provides you with a summary of detected hardware. Best of all, it's free from Microsoft. Specifically, this tool will:

* Identify PCI, EISA, ISA, MCA, and legacy devices, and the system resources used by the detected devices.
* Compare the detected devices with the system requirements and Hardware Compatibility List (HCL) for Microsoft Windows NT Workstation 4.0.
* Use this comparison to show if Windows NT Workstation 4.0 should install and run properly.
* Log the detected devices to a file named "NTCT.TXT" on Disk 2.

In addition to determining if your personal computer is capable of running Windows NT version 4.0, this software tool may be useful in diagnosing issues that occur during installation of Windows NT Workstation.

To download to tool and for more information, go to:

http://www.microsoft.com/windows/common/ntcompto.htm

How to Go to a URL from FileMaker Pro

You can set up a Send Apple Event in ScriptMaker to open Netscape & to go a URL

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Issue:
How do I click on a URL in FileMaker Pro and have it open Netscape and go to that URL?

Answer:
You can write a script in ScriptMaker, then attach a script to that field or you can set up a button next to the field labeled "Go to URL," which would run the script.

The script would have one step, Send Apple Event. After clicking on the Specify button, do the following:
1. Choose Other; Specify the Other Event
2. It will then come up with Specify Event dialog box. Type in GURL in both Event Class and Event ID. This is the Get URL event.
3. Select Field Value. A dialog box will come up listing your fields, you should choose the field where the URL is stored.
4. At the bottom, put a check in both options, Bring Target Application to Foreground and Wait for Event Completion Before Continuing.
5. Click on the Specify Application button and go to the folder where Netscape is stored (or other browser) and double click on Netscape.

Claris Emailer 2.0: Important Information

The read me document for Claris Emailer 2.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Important Information Regarding Claris Emailer 2.0

Thank you for choosing Claris Emailer 2.0, the best way to manage your email. Please take the time to read this document. It includes valuable information on undocumented features, recommended versions of software necessary to Claris Emailer, and compatibility reports and warnings.

IMPORTANT: The installation instructions in the printed Claris Emailer Getting Started guide are inaccurate. For updated instructions, download the PDF version of the Getting Started manual located on the Claris Emailer Web site at <http://www.claris.com/emailer>. Also available from this site is an expanded version of the Claris Emailer 2.0 User's Guide in PDF format, with over 100 pages of additional information.

This File Contains:

1. Installation Information
2. Technical Notes and Tips
3. Compatibility Issues
4. Late-Breaking Issues and More Information

1. Installation

Important: If you are having difficulty upgrading from a previous version of Claris Emailer, please read the document "Upgrading Instructions" located on installation Disk 1.

To obtain the latest version of the full Installation Guide, download the Getting Started PDF from the Emailer page on the claris web site at <http://www.claris.com/emailer>

This version of Claris Emailer 2.0 will install the following files:

-A Claris Emailer 2.0 Application
-This Important Information file
-Upgrading Instructions
-A Claris Emailer Files Folder, containing support files necessary to Claris Emailer 2.0
-A Support Files Folder, containing AppleScript and Modem Tool information
-A Downloads folder which will act as the default folder for any enclosures received. (See the Help Files for instructions on changing the default Downloads folder.)
-Help files, automatically placed in the Claris folder in the System Folder.

Initial installation of Claris Emailer 2.0 will most likely take up less than the recommended 9 mb of hard disk space. However, as more messages are added to the mail database, it will grow. If you currently have stored mail in Claris Emailer 1.X that you wish to convert to the new database format, you may need to clear additional hard disk space prior to launching Claris Emailer 2.0.

2. Technical Notes and Tips

A. Open Transport

If your Macintosh is running Open Transport networking software, Claris recommends that you use the latest release version of Open Transport, currently 1.1.2. This software is available from the Apple web site at <http://www.info.apple.com>.

B. Versions of PPP

If your Macintosh is running Open Transport networking software and you have a dial-up connection to your internet service provider, please obtain the latest Open Transport compatible version of your PPP software. OT/PPP, Apple's PPP software, is available free of charge from the Apple web site at <http://www.info.apple.com>.

C. Next Message Command Key

The command key equivalents for previous and next message are command - [and command -]

D. Get All Messages from Server

In the account options for all Internet and OfficeMail accounts the button 'Get all messages from server' will download all messages currently on the server regardless of their status as read or unread.

E. Mail Database Recovery Option

Holding down the Option key as you launch Claris Emailer, will provide the option of rebuilding the database. This feature will repair any damage and compact the file to reclaim unused space. A backup copy of your current mail database will be saved automatically in the Mail folder in the Claris Emailer Files folder. (Note: For larger databases, this process may take some time.)

F. Marking Recipients as Unsent

You can resend any message to the same recipient by opening the previously sent message in Sent Mail or wherever it currently resides and then clicking the green check to the left of the recipient's name. From the resulting pop-up menu select "Mark recipient as unread". The message will send with the next connection to that account.

G. AppleScript for Converting 1.X Databases

If you choose not to convert your old messages when you first install Claris Emailer 2.0 an AppleScript for converting all your messages later is available. The script is located in the AppleScripts folder in the Support Files Folder in your Claris Emailer folder and is called "Convert Emailer 1". As long as the necessary AppleScript software is installed, simply double-click on the AppleScript and select your old Emailer Files folder.

H. AOL Address Converter

For those who are already using version 3.0 of the AOL client software, a separate address book converter is available from the Claris Emailer support page on the Claris web site at <http://www.claris.com/emailer>.

3. Compatibility Issues

A. Norton Disk Doctor

Do NOT run Norton Disk Doctor while Claris Emailer 2.0 is running. This can result in a damaged mail database and lost data. No issues will occur if Claris Emailer 2.0 is not running when Norton Disk Doctor checks the drive.

B. WebQuick WWW Menu Garbled

If you are running WebQuick by Europa Software (included with NOW). You must have the latest version, or you may experience garbled menus in the WebQuick interface. Europa can be found at <http://www.europasoftware.com>

C. Saving to PostScript File

Using the print dialog to save multiple messages to a Postscript file on your drive, may cause Claris Emailer 2.0 to quit unexpectedly. The issue does not occur when saving only a single file.

D. QuickHelp Issues

-There is a conflict with the version of QuickHelp that Claris Emailer 2.0 installs (4.0) and certain configurations of QuickTime. If QuickTime Musical Instruments is installed but disabled and QuickTime and QuickTime Power Plug are enabled, QuickHelp 4.0 will crash during startup.

The issue will not occur if all three are enabled or Musical Instruments is removed.

-If previous versions of QuickHelp are RUNNING when QuickHelp 4.0 is launched from the Help menu in Claris Emailer, QuickHelp 4.0 will not launch.

E. GTQ Scripting Additions

GTQ scripting additions (AppleScript software for PowerTalk) may interfere with AppleScript capabilities in Claris Emailer 2.0. Remove the GTQ additions to avoid issues.

4. Late-Breaking Issues and More Information

TA43668_Claris_Emailer_Important_Information.pdf

For late-breaking news, instructions on how to subscribe to the Emailer-Talk list from Raven Systems Ltd., and further information regarding Claris Emailer, please consult the Claris Emailer home page: <http://www.claris.com/support/products/emailer/emailer.html>

For information on how to contact Claris Technical Support please see the Claris Service Directory included in the box.

If Only Decor Available is Gray

Missing Decors are a result of missing folder, duplicate copies of the application, or moved application or folders.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If the Decor shows up as gray then there are three things to check for:

1. The application has been moved. Claris Organizer 2.0 looks for the Decors Folder in the same folder as the application. If the Application has been moved out of the folder, like into the Apple Menu Items folder, then the decors aren't available to the application.

2. The same holds true if the Decors folder is moved or renamed. The application and the sub-folders in the Claris Organizer folder must all be kept together.

3. After updating the application there will be two copies of the application on the computer. Under some circumstances, like launching the application from the Launcher alias, the user may use the original version instead of the new version. Since the original may not be in the Claris Organizer Folder the Decors will not show in the menu.

LaserWriter 2.0 ROM: Problems the New ROMs Haven‘t Fixed

This article has been archived and is no longer updated by Apple.

Nearly all the problems described in section D.7 of the PostScript Language Reference Manual (copyright 1985, Adobe Systems, Inc., Addison-Wesley Publishing Co., ISBN 0-201-10174-2) have been fixed in the new LaserWriter software. The only unsolved problems are:

-- The readline problem described under 'Input/output problems'

-- The BuildChar problem, described under 'Font and cache problems'

-- The manualfeed problem, described under 'Miscellaneous problems'

The first of these should be considered a property of all PostScript printers when connected to AppleTalk; the latter two are peculiar to the LaserWriter.

Apple HD SC Setup 2.0.1: Partition Size

I just used the new Apple HD SC Setup 2.0.1, part of System Software 6.0.5, to reformat the internal HD80 SC drives on my Macintosh IIci and my Macintosh II. I was surprised to find that this reduced the disk capacity by roughly 1MB. I did a backup using DiskFit before reformatting. After reformatting, there wasn't enough room to restore. After deleting some non-essential files to make everything fit, I have "74,753K in disk and 1,539K available". Where did the space go?

This article has been archived and is no longer updated by Apple.
If a Quantum PRO drive was originally initialized with Apple HD SC Setup 2.0, the HFS partition would be larger than if it was initialized with Apple HD SC Setup 2.0.1. The reason is that the PRO drives were not directly supported by Apple HD SC Setup 2.0 (the drive did not exist yet!). However, because it was an Apple drive, the Apple HD SC Setup 2.0 software supported the drive with generic, Apple-drive settings. The size of the HFS partition was rounded down to the closest 20MB. Therefore, under Apple HD SC Setup 2.0, the HFS partition was 160,000 blocks (even).

Apple HD SC Setup 2.0.1 included changes that added direct support for PRO drives and the Macintosh IIci. (See the "System 6.0.5 Final Change History" for details.) The default HFS partition size for each drive is in an internal lookup table. The number of blocks allocated on a standard, known 80MB drive is 156,270 blocks. This size has been dictated by the original Quantum Q280 5.25-inch drive that had only 156370 blocks. To make ALL 80MB drives look alike (at least on the surface), we standardize on one 80MB partition size.

Therefore, if you had a PRO 80s drive, and you initialized it with Apple HD SC Setup 2.0 software and then went to Apple HD SC Setup 2.0.1 software, you would have lost 3730 blocks of storage or about 1.5MB. A workaround would be to use the CUSTOM partition screen, remove the original HFS partition, and create a new one manually, which is 80,000K.

Where Are OT/PPP Control Panel Settings Stored?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This article is taken from the Apple Computer TechInfo Library

TECHINFO-0021132

The configuration information entered through the PPP control panel are stored in the Remote Access Connections document (System Folder:Preferences:Remote Access:Remote Access Connections). Removal of this file clears all PPP control panel preferences including saved configurations and connect scripts.

Modem scripts used by OT/PPP are stored in the same location as ARA modem scripts, (System Folder:Extensions:Modem Scripts).

Modem control panel settings are stored in the Modem Preferences file (System Folder: Preferences: Modem Preferences).

Claris Organizer Version 2.0v2 Updater: Read Me

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Claris Organizer 2.0v2 Updater

Important:
To use this updater you must have already installed Claris Organizer 2.0. If, for any reason, the updater doesn't work for you, make a backup of your personal Organizer data file (you should always do this anyway) and re-install Claris Organizer 2.0 from your original diskettes. When the installer is finished DO NOT restart your computer. Instead, immediately launch the updater again.

To take advantage of the updated Instant Organizer you must restart after using this updater.

Bugs Fixed in Claris Organizer 2.0v2

- There was a problem with deletion of recurring tasks or appointments in the monthly calendar window. This has been fixed.
- The speed of various popup menus in the contact card and the list view windows has been dramatically increased.
- When the alarm notification dialog appears it will be accompanied by your computer's alert sound.
- Printing of single, marked contacts should now work in all cases.
- Many other small changes that should make Claris Organizer even more stable.

Suggestions
Do not let too many items accumulate in your popup menus. The popup menus are designed to provide short-cuts to frequently used cities, companies, etc. If you expect to have a very large number of contacts (over one thousand) we suggest that you turn off the "Add new items to menus" preference. Here's how to do this: from the Edit menu choose "Preferences..." then click on the icon on the left that is labeled "Contacts". Find the check-box that says "Add new items to menus" and un-check it.

There is also another preference that you might consider disabling if you have a very large number of contacts. If you turn of the "Do not auto-attach contacts" preference you will be spared waiting for the auto-attachment dialog when you enter a new appointment, task, or event that contains a reference to a contact. To turn off this preference select "Preferences..." from the Edit menu. Click on the icon on the left that is labeled "General". Select the radio button that says "Do not auto-attach contacts". You may also want to experiment with the other three radio buttons in this preference panel.

Small Business Collection for Macintosh CD - Begin Here

Begin Here document for the Small Business Collection for Macintosh CD.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Welcome to the Small Business Collection for Macintosh!

* Small Business Collection for Macintosh CD #1
* How to Really Start Your Own Business published by Inc. Magazine and Zelos Digital Learning

****
The Small Business Collection for Macintosh CD #1 includes:

4 full software applications:
* FileMaker Pro 2.1 - see enclosed card for cross-platform offer
* ClarisImpact 2.0 - NEW RELEASE!
* Apple Personal Diagnostics 1.1.2 - NEW RELEASE!
* ClickBook 1.2.8 - NEW RELEASE! (see below for important installation instructions)

and

* FileMaker Pro Ready-to-Use Solutions
- Over 20 Ready-to-Run Solutions created to help you manage your business & home: Lead Tracking Manager, Expense Manager, Invoice System, Project Manager, Product Manager, Contact Manager, To Do List, Asset Management, Home Budgets, Messages, Personnel Records, Employee Leave Form, Job Search Database, Job Application Form, Buy vs. Lease Analysis, Home Inventory, Student Database and Party/Wedding Planner.

- A Guide to More Solutions, CSA.fm, a directory of services and solutions created specifically for Claris software applications by Claris affiliated consultants, trainers, custom developers and publishers located in the United States and Canada

and
* Important Information:
- Developer program and services information - see description below
- How to order additional Claris and Apple applications, templates and courseware
- SimpleText and TeachText by Apple Computer
- FrameViewer application to facilitate viewing of User Guides for ClarisImpact and FileMaker Pro
- Adobe Acrobat to facilitate viewing of User Guides for Apple Personal Diagnostics
- Information on Claris Support. Please see the Reference Guide for support on non-Claris products

DEVELOPER INFORMATION
* A program overview of the Claris Solutions Alliance, a program created exclusively for software professionals and publishers who provide effective solutions for corporations, small businesses, educators and end users
* Solution Examples, a movie highlighting the benefits of FileMaker Pro for solution development
* The Claris Solutions Alliance enrollment application

****

How to Order Claris or Apple Applications, Templates and Courseware

Claris and Apple applications, courseware and training materials are available through your schools or districts for volume purchase licensing. To obtain more information about volume purchases, please call 800-3-CLARIS.

For individual or parent purchases of Claris products at Education pricing, please call 800-544-8554, extension 490.

For Support information on non-Claris products, please see the Reference Guide included in the box.

****

INSTALLING THE SOFTWARE:

Please see the Reference Guide enclosed in the box. In addition, for instructions on installing ClickBook open the ClickBook 1.2 folder, then double-click the ClickBook Introduction file.

TA43677_Small_Business_Collection_for_Macintosh_CD_Begin_Here.pdf

Once ClickBook and FileMaker Pro are installed, please refer to the FileMaker Pro Quick Start file written by BookMaker that provides step-by-step instructions on how to create booklets from FileMaker Pro files

Claris Impact 2.0 Windows Cannot Open A ClarisWorks 4.0 Document

When attempting to open a ClarisWorks 4.0 Document in Claris Impact 2.0, an error message is generated.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
When attempting to open a ClarisWorks 4.0 Document in Claris Impact 2.0, you will receive the following error message:

"This is a ClarisWorks 4.0 document. Claris Impact cannot open a ClarisWorks 4.0 document."

This is due to the fact that the ClarisWorks translator that ships with Impact 2.0 will not recognize the ClarisWorks 4.0 file format.

You can still convert your ClarisWorks 4.0 document into a Claris Impact 2.0 document by saving it in a file format that Impact can read. For instance, you can save the document as .WMF (Windows Meta File), or as .PCT (PICT), both of which can be opened by Impact.

EPSF Image Is Placed Correctly On Screen, but Shifts When Printed

If an EPSF object placed in a ClarisDraw document appears correctly onscreen but alignment shifts when it is printed, the issue may be in the source image.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If an EPSF object placed in a ClarisDraw document appears correctly onscreen but alignment shifts when it is printed, the issue may be in the source image.

For example, in Mathematica, images can be cropped in such a way that the actual size of the object remains the same while only the cropped image is visible. An EPSF file created from this image will include the "removed" part of the image, and if this part is invisible in its environment, the image will appear to have moved.

Solution: Recompile the image in Mathematica so that the image's size matches its visible part, and bring this image into ClarisDraw.

Getting the Correct Path for a Picture in a Container Field When Only a Reference to the File Has Been Stored

You can place the references (pathnames) of a picture container field into another field using AppleScript.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Container fields in FileMaker Pro 3.0 can store a reference to a graphic file instead of storing the actual graphic within the database. By importing a picture and storing a reference only, you can display the graphic on your layout while it is actually stored elsewhere. FileMaker Pro stores the path and name of your file in the field, but there is no feature which allows you to view or modify this path directly. This may become a issue if, after importing pictures as a reference only, you decide to move them to another folder, or if you are using a Web publishing tool that needs to access the references to those pictures so they will appear on a Web page.

AppleScript to the rescue!

A solution to this issue lies in the use of AppleScript applications. The two AppleScript applications below can be used to manipulate the references stored in container fields. They are provided as a reference only and can be modified to more precisely fit your needs. For example, you may alter these AppleScript applications to direct another application to open the graphic instead of putting the reference into a FileMaker Pro field. Or you can use the Replace command to change parts of the path name field to reflect a relocation of folders and then run the script to update or "mass re-import" graphics as references.

Both AppleScript applications were written based on the following assumptions:

1. All records in the current found set contain graphics that have been imported using a reference.

2. The relevant container field is named "Picture."

3. The text field to contain the reference/path is named "FileName."

4. The scripts are to be run as separate applications, either executed manually or by using the "Send Apple Event" script step in ScriptMaker software.

5. FileMaker Pro has the relevant database open and is currently the foremost, or foreground application.

6.You have made a backup of your databases before running these AppleScript applications.

The following AppleScript named "Get References" will get the path name and put it into the field "FileName."

```
Tell application "FileMaker Pro"
-- count the found set of records in the (current) database and
-- put that number into NumOfRecords.

set NumOfRecords to count record of layout 0 of database 1

-- Loop through all the found set

repeat with i from 1 to NumOfRecords

-- Get the contents of "Picture" in a certain record of the
current database

set PictureReference to cell "Picture" of record i of layout 0
of database 1

-- Put the contents into "FileName" as text

set cell "FileName" of record i of layout 0 of database 1 to
PictureReference as text

-- Stop when you run out of records

end repeat
end tell
```

TA43681_Getting_the_Correct_Path_for_a_Picture_in_a_Container_Field_When_Only_a_Ref

The following AppleScript named "Set References" will use the path name in the "FileName" field update the reference in the a field "Picture."

```
tell application "FileMaker Pro"

-- count the found set of records in the (current) database and put that number into NumOfRecords.

set NumOfRecords to count record of layout 0 of database 1

-- Loop through all the found set

repeat with i from 1 to NumOfRecords

-- Set the data reference of "Picture" to the file whose name
is "FileName"

set data of cell "Picture" of record i of layout 0 of database
1 to file (cell "FileName" of record i of layout 0 of database
1 as text)

-- Stop when you run out of records

end repeat
end tell
```

A/UX: System 5 Interface Definition (SVID) Compliance

I want to know what our level of SVID compliance is. Can you help?

This article has been archived and is no longer updated by Apple.

This is the response from A/UX Engineering Management regarding the A/UX SVID compliance:

SVID - System Five Interface Definition is a two-volume book that describes the user and program interface to AT&T System V UNIX. It is published by AT&T and available for a nominal charge. SVVS, System Five Verification Suite, is a lengthy test program from AT&T that one MUST pass, WITHOUT modifications to claim SVID compliance.

A/UX passes SVVS V.2 and always has. The V.2 designation means that it is the verification suite for UNIX release V.2 from AT&T. There is also SVVS V.3, which verifies UNIX V.3 compliance, and there will be a V.4 verification suite available from AT&T shortly.

Now, to make matters a little more complex, there are also optional kernel extensions in the SVID. They are optional, not mandatory. However, if implemented, you pass the optional tests in SVVS to claim compliance. All releases of A/UX 1.0, 1.0.1, 1.1, 1.1.1, 2.0, and 3.0 pass these optional kernel extensions as well.

So the bottom line is that A/UX 3.0 is SVID V.2 compliant with the optional kernel extensions.

There are different editions of the SVID associated with the different releases of AT&T System V:

SVID	System V
Issue 2, Volumes 1 and 2	Release 2
Issue 2, Volumes 1 through 3	Release 3
Issue 3	Release 4

Our current version of A/UX conforms to SVID Issue 2, Volumes 1 and 2.

Making Floppies from Electronic Purchase

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Claris Emailer installer was designed for floppy disks (3 of them) and so your installer should have come with three folders labled "Disk 1", "Disk 2", and "Disk 3". You should be able to copy those folders directly onto floppy disks for storage.

If you want real executable install floppies, you must name the disks as above (no quotes) and then copy the "contents" of the disks (not the folders saying "disk 1", etc.) onto those disks. If you do all that, you should be able to run the installer directly from the floppies.

A/UX: Partitioning Third-Party Hard Drives (6/95)

I want to use a third-party 320MB hard drive and partition it for use with A/UX.

This article has been archived and is no longer updated by Apple.
To partition non-Apple drives, do the following:

1) First, initialize the third-party hard disk drive using SilverLining, FWB Tools, or the utility that came with the drive.

2) Launch the HD SC Setup program that came with A/UX on the installation CD-ROM. (NOTE: The Mac OS version of HD SC Setup cannot be used for this task.)

If you have not yet installed A/UX, then boot from the A/UX Installation CD-ROM. Follow the instructions in the A/UX Installation Guide for preparing the disk and installing the A/UX software.

3) Partition the hard disk. You should refer to the A/UX Installation Guide section on Performing a Custom Installation for detailed instructions.

Some Important Space Considerations

In creating a bootable system disk, don't forget to create Autorecovery and swap space partitions and to leave a minimum amount of user free space:

Autorecovery - The Autorecovery partition maintains a copy of the files used in the A/UX startup process so that, if you ever experience a catastrophic system failure with A/UX, the files that are critical to the A/UX startup process can be restored from the Autorecovery partition, if necessary. The Autorecovery partition requires 3 MB of disk space.

Swap space - A/UX provides the ability to use space on a hard disk to increase the computer's memory. The UNIX terminology, this space is called the swap space, and is used to exchange, or swap, portions of files in the computer's memory with those being kept temporarily on the hard disk. The recommended minimum amount of swap space is 18 MB. Generally, swap space should be set to 1.5 to 2 times the amount of physical RAM installed.

User free space - User free space is a portion of each file system not used for storing data. The space is used by the operating system to maintain the files in the file system. The recommended minimum is 5 MB. It cannot be smaller than 2 MB.

It is recommended that you do not create any partitions larger than 1.8 gigabytes in size.

You may also be able to use the "dp" (disk partition) command under A/UX to partition the entire drive. For more detailed information on how to use "dp", refer to dp(1M) manual pages.

Article Change History:
05 Jun 1995 - Changed access to everyone.
23 Aug 1994 - Updated for HD SC Setup that comes with A/UX.

MacDraw Pro 1.5v3 Updater does Not Run on PowerMacs

This updater only runs on 68k Macintosh computers, not PowerMacs.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The MacDraw Pro Updater, which updates MacDraw Pro 1.5v1 and MacDraw Pro 1.5v2 to MacDraw 1.5v3 and updates the EPSF Translator, will only run on Macintosh 68k machines. On PowerMacs it will not launch properly and closes without any message or error code. It will function properly on a Macintosh 68k based machine.

In order to update your MacDraw Pro application to 1.5v3, you must first update the application on a 68K Mac then transfer the application to a PowerMac.

Installer Issue with CSA CD-ROM Release VI (6)

The alias to the installer for Claris Emailer 1.1v3 is looking for a disk to install from that does not exist.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
There is nothing wrong with the installer for Claris Emailer 1.1v 3 on this disk, however, the alias for the installer was created when the CD was named something different, thus it cannot find the installer.

The solution is to open the installer directly from within the Disk 1 folder.

Company Name Missing on Mailing Labels

Unless the Title field is checked to print, the Company Name will not print on a mailing label.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
When setting up a custom layout for a mailing label, unless the Title field is selected to print, the Company name field will not print, even though it has been selected. The solution is to select the Title to print as well.

Epson Stylus Printer Can Cause Problems with the Library Dialog

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

There is a known incompatibility with ClarisWorks for Kids 1.0 and the Epson Stylus printer drivers 2.52 and 3.04 when background printing is turned on. If you are using either of these drivers and are having problems with the Library dialog in ClarisWorks for Kids 1.0, turn Background Printing off. To do this, select the Chooser under the Apple menu, click on the icon for the Epson Stylus printer, and click the "Off" radio button under Background Printing.

FreePPP, MacPPP, and OT/PPP

This article provides a brief overview of FreePPP, MacPPP, and OT/PPP.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If you use a dial-up connection to the Internet, you'll also need to install an implementation of PPP. As SLIP (Serial Line Protocol) has more or less gone the way of the dinosaur, PPP has taken over. You can use FreePPP or MacPPP with MacTCP or FreePPP or OT/PPP with Open Transport (OT/PPP can only be used with Open Transport).

There is no hard and fast rule about which protocol you should use with which Macintosh or even which networking architecture. If your Macintosh uses a PowerPC processor (four-digit model numbers), OT/PPP may provide a faster connection because it's native, which means it takes advantage of the faster processor. If your Macintosh is a 68K processor, FreePPP and MacPPP might have the edge because they're already running in 68k mode, whereas the native OT/PPP has to run in emulation (which means it's pretending to be written for a 68k Mac) on non-Power Macs.

Setting aside performance benefits, FreePPP does have the edge on user interface, allowing you to monitor connection activity and connect or disconnect by using a menu that's always on the menu bar. FreePPP also makes it easy to write your own modem scripts and adjust your port speed- the speed at which your modem connects. However, if you don't usually tinker with these variables, OT/PPP should suit you just fine.

You can always install both FreePPP and OT/PPP to test which you like better, using the TCP/IP control panel to switch between the two. Of course, remember that you can't switch protocols during an open connection.

A/UX: Recommended Technical and Reference Materials (9/94)

Can you provide documentation or technical references for the following list of OS nucleus functions?

- Interrupt handling
- Process creation and destruction
- Process stat switching
- Dispatching/process scheduling
- Process suspension and resumption
- Process synchronization
- Interprocess communication
- Manipulation of process control blocks
- Support of I/O activities
- Support of storage allocation and deallocation
- Support of the file system
- Support of a procedure call/return mechanism

This article has been archived and is no longer updated by Apple.
First of all, A/UX is based on AT&T System V R2.2 with BSD 4.3 Extensions, which include networking and software interrupts. Both AT&T System V.2.2 Interprocess communication (Message, Semaphores, and Shared Memory) and BSD Interprocess communication (Sockets) are supported by A/UX. Also, NFS (Network File System) from Sun Microsystems is supported by A/UX; services includes NFS, YP, and RPC (Remote Procedure Calls).

With the A/UX description above, and since UNIX is an industry standard operating system, the references for UNIX kernel functions can be found in any UNIX publications and reference books. A notable one is "The Design of the UNIX Operating System" by Maurice Bach. It covers most of the topics.

BSD 4.3 "UNIX System Manager's Manual" is a good reference for B-Net networking and Fast File System (UFS) supported under A/UX 2.0 and 3.0.

"Implementing Remote Procedure Calls" by Birrell and B.J. Nelson is good reference for RPC. It was published in ACM Transactions on Computer Systems, Vol. 2 No. 1, Feb 1984, pp. 39-59.

In addition, the "A/UX Network Applications Programming" documentation contains RPC, XDR, NFS, and YP Protocol specifications and a B-Net programming guide.

For UNIX system programming, the following books are recommended:

- "The UNIX Programming Environment" by Brian Kernighan and Rob Pike
- "Advanced UNIX Programming" by Marc J. Rochkind

Also, O'Reilly and Associates, Inc. publishes the "Nutshell Handbook" series which covers a wide range of UNIX and TCP/IP topics.

"Not Enough Space on the disk" error in ClarisWorks with Gateway Machine Running Windows NT 4.0 on a 2gb+ Drive

There appears to be a problem with some models of Gateway Pentium computers with hard drives of 2+gigs, running Windows NT 4.0 . While running ClarisWorks 4.0 customer have reported receiving a "Not enough space on the disk" error message.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Problem:
There appears to be an issue with some models of Gateway Pentium computers with hard drives of 2 gb+ running Windows NT 4.0. While running ClarisWorks 4.0 customers have reported receiving an error message that there was "Not enough space on disk" to complete an operation.

Windows Explorer shows that there is plenty of space available, but running the Windows NT Diagnostics Report (Start:Programs:Administrative Tools (Common):Windows NT Diagnostics) shows 0 kb available.

Solution:
This seems to be a problem with some specific Gateway models. Please call Gateway Technical Support for assistance (General Technical Support # 800-846-2301, URL: http://www.gateway.com).

ClarisWorks for Kids 1.0 ReadMe -- Macintosh

This is the Read Me file which is included with version 1.0v1 of ClarisWorks for Kids for the Macintosh

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Important Information Regarding ClarisWorks for Kids 1.0 Software

Thank you for licensing ClarisWorks for Kids. We believe you will enjoy hours of entertainment and educational learning with the product. This document contains:

1. Installation Information
2. Technical Notes and Tips
3. International issues
4. Late-Breaking Issues and More Information

1. Installation
The CD version of this software installs the following files:

A. A complete version of the ClarisWorks for Kids application including a full set of clip art, templates, sounds, and movies. Alternatively, you may select to install a subset of the clip art if you have a limited amount of disk space using the Custom Install option. The floppy disk edition includes the complete application but only a subset of the full content found on the CD.
B. This Read Me document.
C. A PDF version of the ClarisWorks for Kids Getting Started Guide. You will need Adobe Acrobat to open the file.
D. A ClarisWorks for Kids Folder, containing the support files necessary to run ClarisWorks for Kids.

E. Help files, automatically placed in the Claris folder in the System Folder.
F. The ClarisWorks for Kids penmanship fonts which are placed in the Fonts folder in the System Folder.

2. Technical Notes and Tips
A. The software is preset to 3,250K minimum and 5,000K preferred and suggested. However, if you intend to work with large documents or insert many QuickTime movies and sounds, it is strongly recommended that you increase the allotted memory partition for ClarisWorks for Kids. This is done by increasing the "preferred size" in the "Get Info" Dialog box in the Finder for ClarisWorks for Kids.
B. If you experience problems running ClarisWorks for Kids on your computer, try turning off any unnecessary System Extensions and Control Panels and restarting your machine. To take advantage of ClarisWorks for Kids' full multimedia capabilities, Apple Computer's QuickTime¨ and Speech Manager and should be turned on. However, to improve performance consider turning these off.
C. Be sure to change your password and "hint" in the Teacher Menu if you are concerned about security.

D. If you had previously installed a beta version of ClarisWorks for Kids, it is recommended that you delete the existing ClarisWorks for Kids Preference file (found in the Preferences Folder in your System Folder) before you install this final version.
E. If you intend to run a web browser from within ClarisWorks for Kids' Web tools folder, you will need sufficient RAM in your computer to open both programs simultaneously.
F. If ClarisWorks for Kids is not "speaking", be sure that Apple MacinTalk (English Text to Speech) software is loaded on your computer. A copy of this software is available on this CD. You should be aware that most voices use 300Kb of RAM above and beyond what is required to run ClarisWorks for Kids. The "Bruce", "Agnes" and "Victoria" voices require 1,500Kb. Also, be sure that you have your computer volume levels turned up (System Folder: Control Panels: Monitors and Sounds).
G. If Adobe Type Reunion is installed on the same computer as ClarisWorks for Kids, menu and button display and functionality may be problematic. Remove Adobe Type Reunion from your Extensions folder within the System folder and restart your computer.

H. Certain Activities will not print correctly to PostScript printers (transparent paint frames do not print WYSIWYG via PostScript printer drivers). These are Copying, Tracing Animals, Hidden Animals, Drawing with Shapes, Graphs, Baseball, Football, Basketball. Some Clip Art library objects are also affected.
I. To achieve maximum performance, consider turning off one or more of the speech options in the Teacher menu's Audio Feedback dialog.
J. ClarisWorks For Kids documents have been saved with Page Setup settings for PostScript printers (e.g. Apple LaserWriter, HP LaserJet). When printing to other types of printers (Apple StyleWriter, HP DeskJet), set Orientation to landscape in the Teacher menu's Page Setup dialog.
K. With Modern Memory Manager turned off (32-Bit Addressing under System 7.1), ClarisWorks For Kids will not work correctly. Use the Memory Control Panel to turn on Modern Memory Manager (or 32-Bit Addressing) and restart your Macintosh.
L. Some sounds are distorted with Virtual Memory on. Use the Memory Control Panel to turn off Virtual Memory.

M. There is a known incompatibility with the Epson Stylus printer drivers 2.52, 2.70, and 3.04, with Background Printing turned On. If you are using one of these drivers and are seeing an empty Library dialog, turn Background Printing Off in the Chooser and relaunch ClarisWorks for Kids.
N. When attempting to save a file to a hard drive with more than 2.1 Gb of free space, a disk full error will result under operating systems prior to 7.5. Either save the file to a floppy, or consider upgrading your system software.

O. If you have selected a clipart library and the program asks you to insert the disk ClarisWorks for Kids CD, this means a file containing a QuickTime movie cannot be located on your hard disk. Insert the ClarisWorks for Kids CD, and Cancel the "Movie cannot play properly" dialog. Select "Hide Clip Art" from the Options menu, then "Show Clip Art" and select the desired library.

3. International Issues

A. ClarisWorks for Kids installs the US English dictionary. If you prefer to use another dictionary, you must open the Claris Folder in the System folder and remove the file called "US English - Spelling" from the folder. Launch ClarisWorks for Kids and from within a document and select Spelling in the Edit menu. The program will then automatically provide you with a dialog box that allows you to locate the Main dictionary. Navigate to the Claris folder in the System folder and select the dictionary of your choice. Your new selection will now be maintained. We've included a copy of the "UK English - Spelling" dictionary on ClarisWorks for Kids CD in the UK Dictionary Folder if you don't already have this software on your computer. Copy it to your Claris Folder in your System folder on your computer's hard drive.

B. If you would like to remove content that is specific to the US edition (US Presidents etc.), simply open from within the Finder the ClarisWorks for Kids folder after installation and navigate to the Clip Art or Activities folders. Remove the unneeded documents.

4. Late-Breaking Issues and More Information

For late-breaking news, please consult the ClarisWorks for Kids home page: <http://www.claris.com/k12/kids>

Changing the Amount of Time Allowed For Services to Shutdown

How to increase the WaitToKillService Timeout value in the System Registry to increase the length of time given for services to shut down.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
In Windows NT 3.51 and 4.0, the WaitToKillServiceTimeout value name in the registry allows you to specify a length of time that the service control manager must wait for services to complete the shut-down request.

To specify the wait time, follow these steps:

1. Start the Registry Editor (Regedt32.exe) and locate the following Registry subkey in the HKEY_LOCAL_MACHINE subtree:

\\SYSTEM\\CurrentControlSet\\Control

2. Highlight the value WaitToKillServiceTimeout

3. From the Edit menu, select String.

4. Enter the amount of time desired in milliseconds (the default is 20,000)

If a value is not present, select Add Value from the Edit menu and enter the following:

Value Name: WaitToKillServiceTimeout
Data Type: REG_SZ
String: <in milliseconds; default is 20,000>)

Note: Keep in mind that if you lose power, it is possible that your uninterruptible power supply (UPS) may not provide enough backup power to the computer to allow all of the services to shut down properly in addition to the shutting down the System. If you have a longer timeout value, the UPS may run out of power before the services run.

5.Click OK and then quit the Registry Editor to save the changes.

A/UX 2.0: How to Start X11 in Color

Configuration

Macintosh IIfx with 8MB RAM and internal HD80 SC
A/UX 2.0b10
External HD80 SC
AppleColor High-Resolution RGB Monitor
X11 Window System (version that shipped with A/UX 2.0b3)

Problem

I can get X11 in color by selecting the "Console Emulator" session type and typing:

X -screen 0 -depth 8

However, I cannot find a way to enable X11 color in such a way that the user can select the "X11" session type and have a color X11 display appear as the default. None of the various .Xdefaults, .x11start, and so on files seems to have an option that tells the X server to expect a color display device. Is there any way to do this, other than via the Console Emulator (or hacking the /usr/bin/X11/X startup script)?

This article has been archived and is no longer updated by Apple.

```
Yes, there are two ways to launch X11, the native X11 Window System, under A/UX
2.0.  One is choosing from the "A/UX Console Emulator" session type.  The other
is choosing from the "X11" session type from the login dialog Option menu.

The problem you are experiencing is because the default X11 server startup
script (/usr/bin/X11/X) starts up the window in black and white mode.  To start
up the X11 server in color mode from the "X11" session, modify the "xinit"
command line in the /usr/bin/X11/X script file as below (this example is for
8-bit color):

Change:

    xinit xterm ... -- XmacII -logo -v $*  >> $DEBUGLOG 2>&1

To:

    xinit xterm ... -- XmacII -logo -v -screen 0 -depth 8 >> $DEBUGLOG 2>&1
```

Word Wrap not working in Netscape 2.0

Messages sent from Emailer as quote-printable will not word wrap in Netscape 2.0.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
I have had the experience that a message prepared in Emailer and read by Netscape mail reads as a long uninterrupted line, until a carriage return is encountered.

This is a bug in Netscape 2.0 that I believe they fixed in 3.0. It was due to an error in managing messages that are quoted-printable. Your messages are probably quoted-printable because you use accented characters.

Any character that requires two or more keystrokes to use is a higher order character (an 8 bit character) that must be broken into a two character (or more) sequence to be sent over the internet, and the message is flagged as quote-printable so the receiving program can properly decode the information.

Column Headings in Multiple Page Timeline Documents

Claris Impact does not automatically repeat column heading information at the top of each page of a multiple page timeline document. Here is a workaround.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

ClarisImpact does not automatically repeat column heading information at the top of each page of a multiple page timeline document. If you have many tasks and your timeline is longer than one page, you can place headings at the top of each page of your timeline by taking a screen shot of your timeline and copying and pasting the heading part of your picture into the top of your second page. To do this:

1. Under the View menu, select Show Page Breaks

2. Insert a task at the top of your second page; leave this task blank

3. Resize this blank top row so that it is the same height as your heading. Resize the surrounding task rows as necessary to ensure a clean break across pages.

4. Set your View to 100% and make sure you can see as much of your column heading information as possible.

5. Take a screen shot of your timeline (command-shift-3; this is a Macintosh feature that will work in any application)

6. Look for Picture 1 on your hard drive and open it (if you have other screen shots, it may be Picture 2 or Picture 3, etc.)

7. Draw a rectangle around the header part of the picture of your timeline and Copy to the clipboard.

8. Close Picture 1 and return to your timeline

9. Paste your heading at the top of the second page. If necessary, use the Arrange menu options to bring it to the front.

10. If your heading information does not all fit on one screen, make the other part of your heading information visible and repeat steps 5 through 9.

Claris Emailer Version 2.0v2 Updater: Read Me

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Changes between Claris Emailer 2.0v1 and 2.0v2

Claris Emailer 2.0v2 is a maintentance release, consisting of a number of bug fixes and minor feature enhancements.

Bug fixes

1. In AppleScript, "the front window" will now always return the correct window under all circumstances.

2. In AppleScript, accessing unread incoming messages in the Out Box and Deleted Mail folders now works properly.

Enhancements

1. In the Schedule Entry dialog, the day-of-week abbreviations are displayed according to the values set in the Date and Time control panel.

2. In the Schedule Entry dialog, the appropriate hours, separators, and "before noon" and "after noon" tags are displayed according to the values set in the Date and Time control panel.

3. When clicking the "Stop" button on the connections Dialog with the Option key depressed, all pending connections will be stopped--not just the current one. Clicking Stop without the Option key depressed will stop only the current connection as with previous versions of Claris Emailer.

4. The "filter" Applescript verb has been added; this will apply mail actions to specified messages.

5. The number of characters accessible from within AppleScript in the subject field has been increased to 255.

6. Added the "properties" property to allow getting all properties at once with an AppleScript.

7. Claris Emailer will now sort contacts, recipients, and subjects according to the rules of the language specified in the Text control panel. If you are upgrading from Emailer 2.0v1, you will need to rebuild ("Typical Rebuild") your message database to take advantage of this feature.

IMPORTANT: Once you have rebuilt the database with Claris Emailer 2.0v2, you will not be able to open the database with Claris Emailer 2.0v1 unless you rebuild the database using the Advanced Rebuild option with 2.0v1.

HOW TO REBUILD YOUR DATABASE: Quit Claris Emailer if it is running. Launch Claris Emailer, holding down the Option Key. You will see the rebuild dialog. Click on the Typical Rebuild or the Advanced Rebuild radio button, as needed, and then click the Rebuild button.

"Typical Rebuild" will remove deleted messages from the Mail Database file and compact the file; it will also remove index entries to those messages from the Mail Index file, reducing the size of that file as well. "Advanced Rebuild" will create a new Mail Index file from the Mail Database file; this will result in deleted messages becoming undeleted, and may expand the size of both files.

You will need free disk space equal to the combined sizes of the Mail Database and Mail Index files in order to be able to rebuild the database.

8. New AppleScripts added to the AppleScript menu:
- Mark as read (marks selected messages as read)
- Mark as unread (marks selected messages as unread)
- Run mail actions on message (performs mail actions on selected messages)
- Toggle schedules (Toggles schedules on and off)

To the Example AppleScripts folder
- Save messages as text Saves selected messages as text files)

9. AppleScripts that have been modified
In the AppleScript menu:
- Go to Claris Emailer Home Page
- Register Claris Emailer

In the 'Example AppleScripts' folder:
- Emailer USENET news WWW search
- New unread mail in the In Box

Important Information Regarding Claris Emailer 2.0

IMPORTANT: The installation instructions in the printed Claris Emailer Getting Started guide are inaccurate. For updated instructions, download the PDF version of the Getting Started manual located on the Claris Emailer Web site at <http://www.claris.com/emailer>. Also available from this site is an expanded version of the Claris Emailer 2.0 User's Guide in PDF format, with over 100 pages of additional information.

This File Contains:

1. Installation Information
2. Technical Notes and Tips
3. Compatibility Issues
4. Late-Breaking Issues and More Information

1. Installation

Important: If you are having difficulty upgrading from a previous version of Claris Emailer, please read the document "Upgrading Instructions" located on installation Disk 1.

To obtain the latest version of the full Installation Guide, download the Getting Started PDF from the Claris Emailer Support page at <http://www.claris.com/emailer>.

This version of Claris Emailer 2.0 will install the following files:

-A Claris Emailer 2.0 Application
-This Important Information file
-A Claris Emailer Files Folder, containing support files necessary to Claris Emailer 2.0
-A Support Files Folder, containing AppleScript and Modem Tool information
-A Downloads folder which will act as the default folder for any enclosures received. (See the Help Files for instructions on changing the default Downloads folder.)
-Help files, automatically placed in the Claris folder in the System Folder.

Initial installation of Claris Emailer 2.0 will most likely take up less than the recommended 9mb of hard disk space. However, as more messages are added to the mail database, it will grow. If you currently have stored mail in Claris Emailer 1.X that you wish to convert to the new database format, you may need to clear additional hard disk space prior to launching Claris Emailer 2.0.

2. Technical Notes and Tips

A. Open Transport

If your Macintosh is running Open Transport networking software, Claris recommends that you use the latest release version of Open Transport, currently 1.1.2. This software is available from the Apple web site at <http://www.info.apple.com>.

B. Versions of PPP

If your Macintosh is running Open Transport networking software and you have a dial-up connection to your internet service provider, please obtain the latest Open Transport compatible version of your PPP software. OT/PPP, Apple's PPP software, is available free of charge from the Apple web site at <http://www.info.apple.com>.

C. Next Message Command Key

The command key equivalents for previous and next message are command - [and command -]

D. Get All Messages from Server

In the account options for all Internet and OfficeMail accounts the button 'Get all messages from server' will download all messages currently on the server regardless of their status as read or unread.

E. Mail Database Recovery Option

Holding down the Option key as you launch Claris Emailer, will provide the option of rebuilding the database. This feature will repair any damage and compact the file to reclaim unused space. A backup copy of your current mail database will be saved automatically in the Mail folder in the Claris Emailer Files folder. (Note: For larger databases, this process may take some time.)

F. Marking Recipients as Unsent

You can resend any message to the same recipient by opening the previously sent message in Sent Mail or wherever it currently resides and then clicking the green check to the left of the recipient's name. From the resulting pop-up menu select "Mark recipient as unread". The message will send with the next connection to that account.

G. AppleScript for Converting 1.X Databases

If you choose not to convert your old messages when you first install Claris Emailer 2.0 an AppleScript for converting all your messages later is available. The script is located in the AppleScripts folder in the Support Files Folder in your Claris Emailer folder and is called "Convert Emailer1". As long as the necessary AppleScript software is installed, simply double-click on the AppleScript and select your old Emailer Files folder.

H. AOL Address Converter

For those who are already using version 3.0 of the AOL client software, a separate address book converter is available from the Claris Emailer support page on the Claris Emailer Support page at <http://www.claris.com/emailer>.

3. Compatibility Issues

A. Norton Disk Doctor

Do NOT run Norton Disk Doctor while Claris Emailer 2.0 is running. This can result in a damaged mail database and lost data. No problems will occur if Claris Emailer 2.0 is not running when Norton Disk Doctor checks the drive.

B. WebQuick WWW Menu Garbled

If you are running WebQuick by Europa Software (included with NOW). You must have the latest version, or you may experience garbled menus in the WebQuick interface. Europa can be found at <http://www.europasoftware.com>

C. Saving to PostScript File

Using the print dialog to save multiple messages to a PostScript file on your drive, may cause Claris Emailer 2.0 to quit unexpectedly. The problem does not occur when saving only a single file.

D. QuickHelp Issues

-There is a conflict with the version of QuickHelp that Claris Emailer 2.0 installs (4.0) and certain configurations of QuickTime. If QuickTime Musical Instruments is installed but disabled and QuickTime and QuickTime Power Plug are enabled, QuickHelp 4.0 will crash during startup.

The problem will not occur if all three are enabled or Musical Instruments is removed.

-If previous versions of QuickHelp are RUNNING when QuickHelp 4.0 is launched from the Help menu in Emailer, QuickHelp 4.0 will not launch.

E. GTQ Scripting Additions

GTQ scripting additions (AppleScript software for PowerTalk) may interfere with AppleScript capabilities in Claris Emailer 2.0. Remove the GTQ additions to avoid problems.

4. Late-Breaking Issues and More Information

For late-breaking news, instructions on how to subscribe to the Emailer-Talk list from Raven Systems Ltd., and further information regarding Claris Emailer, please consult the Claris Emailer Support page at <http://www.claris.com/emailer>.

For information on how to contact Claris Technical Support please see the Claris Service Directory included in the box.

Setting a Default Color Palette in ClarisImpact 2.0

The documentation for ClarisImpact 2.0 Macintosh [page 3-21] for setting a default palette is incorrect. The correct procedure is detailed below.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The documentation of ClarisImpact 2.0 gives incorrect information on how to select a default color or gradient palette for the application.

The documentation instructs you to Choose Colors and Gradients from the Layout menu, and Click Make Default.

There is no Make Default button.

The correct procedure is to Choose Colors and Gradients from the Layout menu, Click Open and select an alternative palette, Click OK. Then, Choose Save As from the File menu, Select ClarisImpact Options from the pop-up menu. Click Save.

This creates a new ClarisImpact Options document which the application uses as a template for creating new documents. The Options document stores color palette information.

Some Font Suitcases Cannot be Opened, Moved or Deleted under Mac OS 8

Attempting to open, move or delete some fonts results in the alert: "The name, "TT BernhardMod Rm/Bd BT" is already taken. Please use another name."

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Most of the font "suitcases" installed with ClarisImpact 2.0 cannot be opened in Mac OS 8.

Attempting to open:
TT BernhardMod Rm/Bd BT
TT Bodoni Bd BT
TT Bodoni BT
TT ClassGarmnd Rm/Bd BT
TT Futura BdCn BT
TT Futura Bk BT
TT Futura Md/Bd BT
TT GeoSlb712 Md/Bd BT

...will results in the alert: "The name, "xxx" is already taken. Please use another name."

These other fonts behave properly:
TT CommercialPi BT
TT CopprplGoth Bd BT
TT CopprplGoth BdCn BT
TT Futura MdCn BT

Note: In all cases, the fonts seem to display OK in the font menu and there have been no reports of other "abnormal" activity. However, the suitcases, once installed cannot be dragged out of the 'blessed' Font folder. If you drag the entire folder to the desktop and restart, you can trash them (but you still can't open them).

ClarisWorks Menus Do Not Appear Correctly in Mac OS8

Menus in ClarisWorks appear with gray borders with white squares.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
When running ClarisWorks 4.0 with Mac OS 8, the menus will not be gray when "System-wide platinum appearance" is checked in the Appearance Control Panel. Instead, the Font menu will have a gray border, and other menus will have white squares in them.

This is a cosmetic problem. The menus do work correctly.

From the Mac OS 8 Read Me file:
"Unusual or inconsistent appearance
Some applications will exhibit unusual or inconsistent cosmetic anomalies when used with Mac OS 8. These are harmless, but if they bother you turn off the system-wide setting in the Appearance control panel. Contact the manufacturer of the program to see if an updated version of the program is available."

At this time there is no update to ClarisWorks 4.0 that fixes this problem, and no update is planned. This problem is corrected in ClarisWorks Office 5.0.

LaserWriter IINTX: Timeout Problems

I have a Compaq PC connected via serial cable to an LaserWriter IINTX. I used terminal emulation to enter PostScript interactive mode and changed the default timeout parameters so that jobs never time out. I want to change these parameters back to a more normal setting.

When I enter the interactive mode and keys in "statusdict begin" followed by a carriage return, the command is processed and the whole job finishes. However, I can't get the LaserWriter IINTX to accept any of the remaining commands required to reset the default settings. Normally, I would get the PS> prompt, but since the change was made to the timeout defaults, this is no longer the case.

1) How can I change back to reasonable default times?

2) Why am I seeing this problem? Is there something strange going on in the product, or am I doing something that's not permitted?

Nevertheless, printing from applications using the batch mode still works OK, and jobs still seem to timeout.

This article has been archived and is no longer updated by Apple.
Using the following sequence of commands, we were able to set and restore timeout defaults using both batch and interactive modes. Line numbers are for reference in this article only, and are not required by the printer.

```
1 serverdict begin 0 exitserver
2 /helvtica findfont
3 15 scalefont
4 setfont
5 72 700 moveto
6 /str 20 string def
7 %statusdict begin 0 60 30 setdefaulttimeouts
8 statusdict begin defaulttimeouts str cvs show
9 str cvs show
10 str cvs show
11 showpage
```

What may be confusing in interactive mode is that after typing line 1 the "PS>" prompt is no longer displayed and the printer stops echoing keystrokes to the user. Type line 2 to prove that commands are still accepted by the printer. It returns a notice that it can't find "helvtica" and is substituting courier. Turning local echo on after line 1 will eliminate blind typing.

Commenting out line 7 lets the user power-cycle the printer to see that the changes are permanent. Lines 8, 9, and 10 pop values returned by defaulttimeouts off the stack in the order wait, manual feed, job.

Information on setdefaulttimeouts and defaulttimeouts is available on page 300 of the "PostScript Language: Reference Manual" from Addison-Wesley (ISBN # 0-201-10174-2).

ClarisWorks 5.0 - Disk 3 of 9

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

ClarisWorks 5.0 - Disk 3 of 9

A batch of disks for ClarisWorks 5.0 (Macintosh) were distributed where Disk 3 had the contents of Disk 4 by accident. If you have one of these disk sets, you can download an image of DIsk 3 from our web site, and use it to restore the proper contents of floppy disk #3.

REQUIREMENTS 'Mac OS 7.0.1 or later 'A Macintosh or Mac OS compatible computer with a 1.4 MB floppy drive. This includes all PowerPC computers, all Performa computers, all LC series computers, all Centris and Quadra series computers, and all PowerBook computers equipped with a floppy drive. Macintosh computer models that do not have this size floppy drive include the Mac 128, Mac 512, Mac Plus, some Mac SE and some Mac II series computers. If you?re uncertain, see the manual that came with your computer for more information.

To make a floppy from a disk image

1. Make sure you have enough 1.4 meg floppy disks at hand to make a complete set of disks. Each disk image file will require a separate floppy disk.

2. Quit all open applications and start Disk Copy.

3. Choose "Make a Floppy..." from the Utilities menu and select the first disk image file. Disk Copy verifies the disk image file to ensure that it is not corrupted.

4. When prompted, insert a 1.4 MB floppy disk. Disk Copy shows a dialog box asking you to confirm that you want to erase everything on the floppy disk. Click OK. Disk Copy finishes and verifies the new information on the floppy disk.

5. Write the name of the disk on a label and affix it to the disk. Do not rename the disk on the computer. Disk Copy will properly name the disk.

6. Choose "Make a Floppy..." from the Utilities menu and select the next disk image file. Repeat this process until all of the new floppies have been made.

NOTE If you have a PowerBook computer with a removable or separate floppy drive, you?ll need to make sure that the floppy drive is connected and available before attempting to make a floppy with Disk Copy.

Two Help Menus Better Than One?

Claris Organizer 2.0v2, while running on Mac OS 8, displays two Help menus side-by-side

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Claris Organizer 2.0v2, while running on Mac OS 8, displays two Help menus side-by-side.

The left-most Help menu is actually the Claris Organizer Help menu that is specific to Claris Organizer, such as:
Contents...
Search Index for...
Tips...
Ten Minute Tour...

The right-most Help menu is the Mac OS Help menu, containing items such as:
Balloon Help, Help Topics, as well as the contents of the other Help menu.

Both menus are active and fully functional. Besides the odd appearance of two Help menus, there are no other known oddities specific to Mac OS 8 and Claris Organizer 2.0.

This is a cosmetic problem. The menus do work correctly.

From the Mac OS 8 Read Me file:
"Unusual or inconsistent appearance
Some applications will exhibit unusual or inconsistent cosmetic anomalies when used with Mac OS 8. These are harmless, but if they bother you turn off the system-wide setting in the Appearance control panel. Contact the manufacturer of the program to see if an updated version of the program is available."

At this time there is no update to Claris Organizer 2.0 that fixes this problem, and no update is planned.

ClarisWorks for Kids Brings Power and Ease of Use to Students, Parents and Teachers

ClarisWorks for Kids allows teachers and parents to combine a large mix of ready-made templates and educational clip art to create activities that can enhance a child's learning opportunities.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

The ClarisWorks for Kids integrated software package, designed specifically to help children in grades K - 5 (ages 5-11) excel in school and inspire learning at home, is now available. Based on ClarisWorks 4.0 software, ClarisWorks for Kids allows students to communicate their ideas in a variety of creative, powerful, and fun ways.

Using a Writing Pad (word processing), Art Pad (painting), List Pad (database) and Graphing Pad (spreadsheets) -- all designed for the younger child -- teachers and students will find that ClarisWorks for Kids has all the tools they will need to work successfully.

With more than 75 fun and creative activities -- from charting the weather to measuring plant growth -- ClarisWorks for Kids provides rich educational content in many subjects, including language arts, math, history, geography and science. Teachers as well as parents can easily design new activities in ClarisWorks 4.0 software, since it is document-compatible with ClarisWorks for Kids. A password protected adults-only menu lets adults customize the use of ClarisWorks for Kids to suit different age levels and activities.

Ability to create templates in ClarisWorks 4.0 is key

The ability to create custom templates in ClarisWorks 4.0 is one of the key features of ClarisWorks for Kids because it gives teachers, parents, and outside developers the ability to put together an almost unlimited number of lesson activities. Work sheets, special projects, even entire units (related activities on a specific subject) can be assembled, shared with colleagues, or marketed.

Special features

Among the features that make ClarisWorks for Kids a true standout are its large collections of sounds, movie clips and educationally relevant clip art, all designed to allow students to make creative, exciting documents, reports and graphs. Also included are easy-to-read penmanship fonts, an intuitive filing system and musical color palettes. A text-to-speech command lets students hear their work read back to them. Whether they're creating multimedia reports that build on what they've learned or illustrated stories that come straight from the imagination, children will find that ClarisWorks for Kids contains the tools they need to bring their ideas to life.

System requirements for the Mac OS

* Mac OS-compatible computer with a 68020 or higher processor
* System 7.1 or later
* 8 MB RAM (if running System 7.1)
* 10 MB RAM (if running System 7.5/7.6)
* 13" monitor (or larger)
* 30 MB disk space for minimal installation; 150 MB disk space for full installation.
* CD-ROM drive [Note: ClarisWorks for Kids software is shipped on CD-ROM. The CD-ROM includes a tremendous amount of clip art, templates and activities. A high-density diskette version is available for an additional fee. The diskette version, due to space, contains the entire ClarisWorks for Kids application but only a subset of the full CD content. The diskette version is fully functional and can provide hours of enjoyment for your child or student. Check with your Claris reseller for more information on how to obtain the diskette version.

Problems in Removing Objects from Documents with Missing Fonts

Deleting objects or layers with text does not necessarily modify the font information associated with the document.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
When fonts are used in a ClarisDraw document, ClarisDraw keeps an internal list of used fonts within the document. If the fonts are then changed or removed, the internal font list may not reflect the fact that the removed fonts are no longer present.

This idiosyncrasy becomes very evident when a document is transferred from one machine to another where the installed fonts are different. ClarisDraw will report the uninstalled fonts used in the document as missing. Removing or changing the fonts in the document to match the current installed fonts, then saving the document, will not remove this message when the file is reopened. The only workaround is to create a new document and then copy and paste the desired objects into the new document.

Category Sub-menu Does Not Display with OS 8

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When running under Mac OS 8, the sub-menu for the Category command in the Edit menu does not display all the values. Instead, it displays two to three menu items with up and down scroll arrows to scroll the sub-menu.

The sub-menu does work correctly. This is a cosmetic problem. One workaround is to select Edit Categories, then click done. The sub-menu will then display all the category values.

Macintosh IIfx: Non-Apple RAM SIMM Requirements

Can you give me the specifications for ordering non-Apple RAM SIMMs for a Macintosh IIfx?

This article has been archived and is no longer updated by Apple.
The Macintosh IIfx requires SIMMs that conform to the following specifications:

- 1 or 4MB capacity--256KB SIMMs are not supported.

- 64-pin (for separate Read and Write lines) versus 32-pin for other Macintoshes. The LaserWriter IINTX uses similar, but slower, 64-pin SIMMs. Macintosh IIfx SIMMs will work in a LaserWriter IINTX, but LaserWriter IINTX SIMMs are too slow for the Macintosh IIfx.

- Fast Page Mode support, like the Macintosh IIci.

- 80ns or faster.

Customized Elements Seem to Disappear After a Clean System Installation

The ClarisWorks Shortcuts preferences file must be moved back into the active Preferences folder if a new operating system has been installed using the Clean Install option.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Problem:
Application specific macros (Shortcuts in ClarisWorks 4.0), customized Button Bars, Dictionaries (spell checking, auto-hyphenation, thesaurus), file translation, customizations to Assistants, and Equation Editor preferences seem to disappear when a new Mac OS is installed using the Mac OS Installer's Clean Install option.

Background:
Preference files for all of these features are stored in the Preferences folder in the System folder. (Document-specific shortcuts / Macros are stored with a document).

If a new Mac OS is installed using the Mac OS Installer's Clean Install option, the contents of the old System Folder are placed in a folder called Previous System Folder. Items moved to this Previous System Folder include the Claris folder, which contains spelling dictionaries, help files, translators, etc., and the Preferences folder, which contains preference files for the features above .

Solution:
To restore your customized tools and operations:

1. Quit the ClarisWorks 5.0 or ClarisWorks 4.0 application if it is open.

2. Move the Claris folder from the previous System Folder to the new System folder at the same level as the Control Panels folder and the System file itself. Then move all ClarisWorks 5.0 preferences files (if you're using ClarisWorks 4.0, there is only the ClarisWorks Shortcuts document) from the Preferences folder in the Previous System Folder to the Preferences folder in the new System Folder.

3. Launch ClarisWorks. All previously defined application-specific Shortcuts/Macros, customized Button Bars, specialized Assistants, and Equation Editor customizations should now be restored.

The Line Width Menu, in some Claris Applications, Doesn‘t Display All Line Widths Properly in Windows 95

On some Windows machines, with newer video cards, the line width menu shows only the 1 pt. line. All other point widths show their number, but not the visual line.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
On some Windows machines, with newer video cards, the line width menu shows only the 1 pt. line. All other point widths show their number, but not the visual line.

If set to one point, a line drawn in your Claris application will display correctly. However, if it is set to any other point size, the line will disappear; the only thing you will see is the selection handles on the document.

To fix this problem, you need to reduce the graphics acceleration for your video card.

Follow these steps:

1] Go to the System properties -- right-mouse click on My Computer and choose Properties, or click on Start, Settings, Control Panel, and find the System control panel.

2] Choose the Performance tab. Click on the Graphics button. Slide the indicator from Full acceleration down to None. Restart your machine.

Note: You may have other applications in your system that need some of the capabilities of your accelerated video card. In that case, you will need to experiment with the acceleration setting and figure out the least possible setting that your other applications will work in and that the specific Claris application needs to have to display all line width menu selections.

ClarisWorks & AppleWorks: Password Removal

I used the password protection feature of AppleWorks (or ClarisWorks) to protect a document, but now can no longer remember the password. Can Apple help me remove the password?
This article has been archived and is no longer updated by Apple.
Apple does not offer a password removal service for protected documents.

The password protection feature does not encrypt documents, but modifies them only to the extent that AppleWorks requires a password to open them.

How to Consolidate Spreadsheet Data to One Page

How to print all your data on one page when it is spread across more than one page.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

When printing a spreadsheet larger than a page in ClarisWorks, the spreadsheet will split the information onto two pages, starting from column A, thus, leaving you with one half of your information on the first page and the other half on the second. This is especially noticeable when you have only a few rows but many columns. This will leave you with extra space below each portion of the spreadsheet on each page. What if you could put both halves of the divided spreadsheet on one page?

The following is a work around solution:

1. Go to your spreadsheet and view it in Page View. This will show you how many columns are divided between two pages.

2. Select the columns you want to move by highlighting them with the the mouse.

3. Go to the 'Calculate' menu and select 'Move...'. This is where we will designate the new location of the cells we want to move from the second page.
*note: You will want to designate a cell which is below the information on the first page.

The space below the information on the first page should now contain the information which was located on the second page.

For additional 'Moves', repeat steps 1 -3.

For more info on the 'Move...' feature in ClarisWorks, consult the chapter on Spreadsheets in your User's Guide.

PostScript: Language change incorporates packed arrays

This article has been archived and is no longer updated by Apple.

Several additions have been made to the standard PostScript language. These additions are upward-compatible and do not affect the function of any existing PostScript programs. The changes are included in the new LaserWriter, LaserWriter Plus, and other PostScript printers; they will be documented in a future edition of the PostScript Language Reference Manual.

-- General comments

PostScript programs that are intended to be compatible with all PostScript printers should not make use of the new features. However, it is possible for a program to determine whether or not the new features are present and to invoke them conditionally. The descriptions below suggest how to determine whether a particular feature is present or not.

-- Packed array representation

PostScript procedures are represented as executable arrays which, until now, have been stored in the same fashion as literal data. The representation, while offering maximum flexibility, is very costly in space (8 bytes per element). Large PostScript programs, such as the built-in server program, and downloaded preambles, consume considerable amounts of Virtual Memory.

Since most programs do not require the ability to be treated as data but only the ability to be executed, a more compact representation has been introduced: the packed array. Programs represented by packed arrays are typically 50 to 75 percent smaller than the same programs represented as ordinary arrays.

The packed array object has a type different form an ordinary array object ('packedarraytype' versus arraytype'); but in most respects it behaves the same as an ordinary array.

The differences between a packed array and an ordinary array are:

1. Packed arrays are always read-only: you can't use 'put', 'putinterval', etc. to store into a packed array.

2. Packed arrays are created differently from ordinary array (see below).

3. Accessing arbitrary elements of a packed array can be quite slow; however, accessing the elements sequentially (as is done for the PostScript interpreter and by the 'forall' operator) is approximately as efficient as accessing an ordinary array.

4. The 'copy' operator cannot copy into a packed array since it is read-only; however, it can copy the value of a packed array to an ordinary array of at least the packed array's length.

To create packed arrays, you may employ two methods, the PostScript input scanner and the operator 'packedarray'. More commonly, the PostScript input scanner creates packed arrays automatically for all executable arrays that it reads. That is, whenever the scanner encounters a "{" while reading a file or string, the scanner accumulates all tokens up to the matching "}" and turns them into a packed array instead of an ordinary array. To build a packed array explicitly, invoke the 'packedarray' operator with a list of operands to be incorporated into the new packed array.

SMB Server: Connection Solutions

I am having difficulty attaching to an SMB server on a Token Ring. Here are my system specifications and my AUTOEXEC.BAT listing:

Macintosh configuration:

- Macintosh IIcx
- 1MB RAM
- 40MB hard disk
- 1-bit monochrome monitor
- Apple TokenTalk NB Card
- System 6.0.3, Finder 6.1

Token Ring network:

- IBM PC server running PC LAN 1.32 Extended Services
- Server Name: DOM1
- System software is on drive labeled CDRIVE
- Applications and documents on drive labeled DDRIVE
- Using 4MB Token Ring Interface cards on PS/2 nodes

AUTOEXEC.BAT listing:

```
date
time
PATH=C:\\PCLP13BS;C:\\PCLP13XS\\DOS;C:\\PCLP13XS\\NET1_30
prompt $p$g
cls
@ECHO OFF
YNPROMPT Y N 31 Start PC LAN Program 1.3 (Y/N)?
IF ERRORLEVEL 1 GOTO NOPCLP
FASTOPEN C:=100
NET START SRV DOM1 /XS
IF ERRORLEVEL 1 GOTO NOPCLP
XSDC.BAT
:NOPCLP
```

I know that the cabling is good, because I can successfully connect a PS/2 to the same cables and get a connection. When Iuse the Macintosh, I enter the server drive/pathname through the SMB DA and select it for connection. I get the message: "The server is not responding", which, according to the manual, means that the name or path specified is incorrect.

I believe that I am entering the name and path correctly, although there seems to be some discrepancy as to whether I should enter server name\\path or volume name\\path. I can't find anyone who can tell me if this is an SMB server. IBM systems engineers here haven't heard of SMB. If this is not an SMB server, how can I tell, and can it be made into an SMB server?

Originally, the SMB server hard drive did not have a name. I was using the Macintosh pathname as the server name. I tried naming the Drive volume and using that name in the Macintosh DA SMB pathname, but I still had problems.

This article has been archived and is no longer updated by Apple.
The Server Message Block protocol is a Microsoft-developed protocol that is used in the IBM PC LAN program and OS/2 LAN server. It is a presentation layer protocol corresponding to Apple Filing Protocol (AFP) in the AppleTalk Protocol Stack. Since this server is running the PC LAN program, it is an SMB server.

1) Workstation Name: Workstation Name is the name of your workstation. It tells the network administrator who you are. You can enter any name in this field as long as it has at least one character. The limit is 14 characters. Note that if you are using an OS/2 LAN server, this name must exactly match the username created on the OS/2 server (all in uppercase).

2) When you Add an SMB volume name, the format is \\\\ServerName\\VolumeName.

Server Name is found by issuing the NET NAME command on the server machine. In your case, it is DOM1 as also stated in the NET START command in the AUTOEXEC.BAT file.

Volume Name is the same name you specified in the NET SHARE command. For example, the following shares a volume name "EXAMPLES" for read/write access and with password TESTPASS:

NET SHARE EXAMPLES = C:\\SMB\\EXAMPLES TESTPASS /RW

Note that you "equate" the path to a volume name in the above NET SHARE command on the server, and then use that volume name when you add the server volume. The hard drive name on the server has nothing to do with this utility.

The password is optional if you did not specify one in the NET SHARE command on the server. For testing until you get it to work, omit the password. You can always add a password later. If you specify only the root directory of the drive (such as C:\\), all files on that drive are available to other computers.

To display the sharing status on the server, issue the NET SHARE command without any parameters: NET SHARE. We suggest that you check into this since we did not see any NET SHARE command in the AUTOEXEC.BAT file. Remember, you need to use NET SHARE to "publish" a volume to be shared.

3) Once you have added a volume, select it and click the Connect button. Leave the password field blank, if you did not enter a password in the NET SHARE command on the server.

If the volume is successfully mounted, its name appears in the lower SMB server DA window.

If you add the names of all SMB volumes on your network at one time, later, when you want to access a different volume, its name will already be an option in the Select an SMB volume window.

4) Also, make sure that you use the Apple File Exchange shipped with the latest SMB File Transfer Utility.

We hope that this helps to clear the confusion between server name, volume name, pathname, and so on.

ClarisWorks 5.0 Features

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

New Look And Feel
- Buttons and Button Bars
- Redesigned Text Ruler
- Easily accessible functions in spreadsheet
- Context-sensitive Help using ?

Enhanced Functionality
- Bookmark, Document, and URL links
- Default font easy to set
- Equation Editor
- Password Protected documents
- New Textures palette
- Named Ranges in spreadsheets
- Organize Libraries into Folders
- Apply multiple styles
- Multimedia field in database
- Larger text fields in database (~1000 characters, up from 510)
- Page breaks before and after Parts in database
- New Assistants / Improved Assistants
- New Stationery (templates) / Improved Stationery (templates)
- More clip art

Improved File Compatibility
- Improved HTML translator
- Updated File Translators

Internet Savvy Features
- Start Browser from ClarisWorks
- URL links within ClarisWorks
- Custom buttons for your favorite Web Pages
- Make Web pages
- - save as HTML
- - web page templates
- One button to go to Claris technical support web page
- Interactive documents using links

ClarisWorks 5.0 Mac, Read Me

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Welcome to ClarisWorks 5.0 for Macintosh!

Thank you for choosing ClarisWorks 5.0 software. We're excited about this latest release of ClarisWorks and hope that it will help you to be more productive and creative. This Read Me file documents some tips that may prove helpful when using ClarisWorks 5.0, including changes for users of previous versions of the program. In particular, this document provides information about:

I. New Features in ClarisWorks 5.0
II. Usability and Design Changes in Version 5.0
III. Technical Notes and tips

I. New Features in ClarisWorks 5.0
For a detailed list of the new ClarisWorks 5.0 features, refer to the "ClarisWorks Installation and New Features Guide" (chapter two) or to the ClarisWorks Help System.

Launching Help
1. From the Help or ? menu, choose "ClarisWorks Help Contents"
2. Click on the link "New features in ClarisWorks 5.0" under the section "ClarisWorks Help".

Changes to the Interface
The Button Bar
The most noticeable change in ClarisWorks is the button bar. The button bar gives you one-click access to 150 shortcuts to make your work easier. You can also create your own buttons to appear on the button bar. With so much flexibility the button bar could get pretty crowded so we've added the ability to create multiple button bars. There are 4 different button bars (Default, Assistant, Internet and Document), and you can create your own button bar! You can switch between button bars at any time. Also, you can now dock your button bar at the top, bottom, left, or right on your screen. You can even tear it off to make it into a palette.

The Text Ruler
The text ruler has been streamlined to make it easier to set up tabs and margins. When you move tabs or margins, page guides allow you to align text precisely.

The Paste Function Dialog
In a spreadsheet, clicking the Paste Function button will bring up a dialog showing all functions, organized by category that you can paste into your spreadsheet. This feature makes memorizing the syntax of a function unnecessary.

Compatibility
ClarisWorks can now read documents created in Microsoft Word and Excel, WordPerfect, Lotus 1-2-3, and other applications. You can even save files in these formats as well.

Content
ClarisWorks includes many new stationery files. To see the new stationery files, choose New from the File menu, click the button "Use Assistant or Stationery" and choose "About Stationery" from the pull down menu. Additionally, there are new clip art libraries. Choose "Library" from the File menu to display a menu containing all libraries in the application.

The Internet
Take advantage of the Internet by starting your browser or email application from ClarisWorks, linking a ClarisWorks document to a Web page, creating custom buttons for your favorite Web pages, making your own Web page, or linking documents together.

II. Usability and Design Changes in Version 5.0

Styles
In ClarisWorks 4.0, applying a style to text (for example) then applying another style would "compound" (overlap) the two styles. In ClarisWorks 5.0, you can compound styles or not. By default, compounding styles is turned off. Refer to the Help system using the keyword "Compound Styles command" for more information.

Palettes
The Texture palette is new in ClarisWorks 5.0. You can edit textures as well as patterns and save your customized palettes. For more information, use the keyword "textures" or "palettes" in onscreen Help.

Access To the Help System from within any Dialog
In ClarisWorks 5.0, you can access onscreen Help from any dialog box. This is helpful if you are using a feature and have a question about the functionality. Click on the Help button (a question mark in the lower left corner of the dialog box) to display a Help topic that is applicable to the current dialog box.

Apple Guide Support
The Macintosh version of ClarisWorks 5.0 offers the item "Frequently Asked Questions" under the Help or ? menu. For example, if you've always wondered how to create mailing labels, the "Frequently Asked Questions" feature can help you.

III. Technical Notes and Tips

Using Documents Created in ClarisWorks 2.0, 2.1, 3.0 and 4.0
ClarisWorks 5.0 has a different file format than ClarisWorks 2.0, 2.1, 3.0 (which all used the same file format) and ClarisWorks 4.0.

When you open ClarisWorks version 1.0, 2.0, 2.1, 3.0, and 4.0 files in ClarisWorks 5.0, you will see the message "This document was created by a previous version of ClarisWorks. A copy will be opened and '[v5.0]' will be added to the filename."

To replace your ClarisWorks 1.0, 2.0, 2.1, 3.0, or 4.0 files with ClarisWorks 5.0 versions, choose Save or Save As from the File menu, remove [v5.0] from the file name, and click Replace when ClarisWorks asks if you want to replace the existing file. If you are converting a number of files to the 5.0 file format, you can turn off the warning and the [v5.0] filename suffix by choosing Preferences from the Edit menu and deselecting "Old Version Alert" and "[v5.0] Suffix".

Note: Macros and shortcut buttons created in ClarisWorks 3.0 and 4.0 documents are not supported in ClarisWorks 5.0 and will need to be recreated.

Installing and Using the ClarisWorks File Converter
The "ClarisWorks File Converter" formats version 4.0 files so they can be opened by 2.0, 2.1, and 3.0 versions of ClarisWorks. To install the ClarisWorks File Converter application, you must run the file "Install ClarisWorks" in the ClarisWorks Office Software folder on the CD, choose Custom Install from the popup menu and select the "ClarisWorks 4.0 to 2.0/3.0 File Converter" option from the list under File Translators.

To share ClarisWorks 5.0 files with users of versions 2.0, 2.1, and 3.0, you first save the ClarisWorks 5.0 files in 4.0 format by choosing Save As from the File menu and selecting ClarisWorks 4.0 from Save As Type list. Then you use the separate ClarisWorks 4 to 3 Converter application to convert the 4.0 documents so they can be used with these versions.

For more on using the File Converter, see the document "Read Me - CW File Converter" that is installed with the File Converter.

Using ClarisWorks 4.0 and 5.0 on the Same Macintosh
Some users may want to keep both versions 4.0 and 5.0 on their Macintosh. (You might choose to do this if others in your organization have older versions of ClarisWorks.) Keep in mind that all versions of ClarisWorks use the same "Creator", so older versions of ClarisWorks and the ClarisWorks documents created by them will have the same desktop icons as version 5.0.

Sharing Files with ClarisWorks 5.0 for Windows
ClarisWorks 5.0 for Macintosh has the same file format, user interface, and features as ClarisWorks 5.0 for Windows. ClarisWorks 5.0 for Macintosh also opens files created in ClarisWorks for Windows versions 1.0, 3.0, and 4.0 and converts the files to version 5.0 format. You can create a ClarisWorks document on Windows and edit it on a Macintosh computer or vice versa. Consequently, if you work with both Macintosh and Windows versions of ClarisWorks, or if you collaborate with colleagues who use ClarisWorks 5.0 for Windows, you can work without translating files or learning a different program.

Due to differences between Windows 95/NT and Macintosh platforms, you must use a file transfer program such as PC Exchange, AccessPC, or a similar utility to transfer files via floppy disk. Most Macintosh computers come with PC Exchange installed as part of the operating system. Follow the directions in the documentation for the file transfer utility program. Before copying the files to or from a PC-formatted diskette, rename the ClarisWorks files with DOS-Compatible filenames (8 characters or less, no space or punctuation marks) and be sure to include the .CWK extension. (.CWS for stationery files)

After copying your files to a PC-formatted floppy diskette, you can copy them to your PC's hard drive and open them as you would any ClarisWorks document.

Fonts, margins, page breaks, and graphics may look different after they are transferred from the Macintosh. You can minimize unintended font changes by using TrueType fonts on both platforms. Helvetica on the Macintosh converts well to Arial on Windows, and Times converts well to Times New Roman. To restore the original page breaks, you may need to change the margins and page breaks.

Some macros created on the Macintosh may not run as expected on Windows. In these cases, you'll need to recreate those macros.

Equations created with the Equation Editor become picture objects when transferred to Windows 95/NT. You will need to recreate the equation should you wish to edit it.

Textures will also appear altered when moving from one platform to another. Default textures are replaced by the texture in the same location in the palette on the other platform. Custom textures will come across, but will be altered to meet the size conventions on each platform. Macintosh textures can be as large as 64 x 64 pixels; Windows textures are limited to 8 x 8 pixels. Textures will be enlarged or shrunk as appropriate to fit in the texture palette.

Editing Documents Created with the ClarisWorks Assistants

Some documents created using the ClarisWorks Assistants or provided as Stationery files contain objects that are locked or grouped. (Locking and grouping keeps text and graphics objects in position and prevents accidental edits.)

To unlock and ungroup objects so you can move or edit them:
1. Click the Arrow tool and then select the object.
2. Choose Unlock or Ungroup from the Arrange menu. If an object is both locked and grouped, first unlock it and then ungroup it.

To edit a text object, click the Text tool and then click the text you want to edit.

Adjusting ClarisWorks Memory

In most cases, the preset memory allocation is adequate for working on ClarisWorks documents. However, if you are working with large Paint documents, very long documents, or if you have several large documents open at the same time, you may see the message "Not enough memory to complete this operation" or "The document has been reduced to fit the available memory." These messages mean that you need to increase the amount of memory set aside for ClarisWorks. Increasing the memory allocation may also reduce the time it takes to print some documents.

To increase the memory allocation for ClarisWorks:
1. If ClarisWorks is open, quit the application.
2. Open the folder that contains the ClarisWorks 5.0 application.
3. Click the ClarisWorks application once. (If you click the icon twice, you'll start ClarisWorks. If that happens, choose Quit from the File menu and try again.)
4. Choose Get Info from the File menu.
5. Double-click the Preferred Size box.
6. Type a larger number to increase the memory size.
7. Close the ClarisWorks Info window.

Running the Introduction to ClarisWorks tour

The Introduction to ClarisWorks tour requires a 640x480 monitor or larger, and prefers 256 colors and 4096k of memory. The tour will run at higher color settings and with as little as 2048k of memory, but you may experience color problems or the sound may not work.

If you experience color problems, change the number of colors to 256 using the Monitors control panel.

If you experience memory problems and are running the Introduction to ClarisWorks application and ClarisWorks application at the same time, quit ClarisWorks and double-click the "Introduction to ClarisWorks" file (in the ClarisWorks 5.0 Folder).

Using the Sample AppleScript scripts

Version 5.0 includes four sample AppleScript scripts that illustrate the use of AppleScript to automate ClarisWorks functions. The four AppleScript scripts are located in the ClarisWorks Scripts folder in the ClarisWorks 5.0 folder:

1. Convert Documents converts multiple non-ClarisWorks files, or files created in earlier versions of ClarisWorks, to ClarisWorks 5.0 format.
2. Print Documents prints multiple ClarisWorks documents.
3. Mail Merge merges FileMaker Pro 3.0 database data into ClarisWorks documents.
4. Remote Slide Show runs ClarisWorks slide shows from a remote Macintosh.

For more information on these scripts, consult the "About the AppleScripts" document stored in the ClarisWorks Scripts folder. For more information on the AppleEvents supported by ClarisWorks 5.0, consult the ClarisWorks AppleEvents List document in the ClarisWorks Scripts folder. (The document assumes familiarity with AppleEvents and AppleScript.)

Note: AppleScript is provided with System 7 Pro and System 7.5. If you're using System 7.0 and 7.1, AppleScript is available from Apple Computer, Inc. The Mail Merge and Remote Slide Show scripts require AppleScript version 1.1.

ClarisWorks Required Internet Config Settings

ClarisWorks 5.0 takes advantage of Internet Config 1.3 (installed with the ClarisWorks 5.0 installer) to open Web browsers and electronic mail

(email) applications. We have preset the "Helper" settings defined in Internet Config to use Netscape Navigator as your browser and Claris Emailer software as your email application. If you want to use different Helper applications for Web browsing or email or have previously installed and defined Internet Config settings, you'll need to do the following:

1) Double-click the Internet Config alias icon located in the Internet Config 1.3 folder in the ClarisWorks 5.0 folder (or click the Internet Config button in the ClarisWorks 5.0 Internet button bar).
2) Click the "Helpers" button.
3) Modify (or add as needed) the following entries:
file - <browser application of choice>
http - <browser application of choice>
https - <browser application of choice>
mailto - <email application of choice>
4) Close the "Helpers" window by clicking the close box.

5) Choose Save from the File menu.
6) Quit Internet Config and restart your computer.

For more information refer to the user documentation.html file located in the Internet Config 1.3 folder in the ClarisWorks 5.0 folder on your hard drive.

MacLinkPlus for ClarisWorks
The MacLinkPlus for ClarisWorks files are not compatible with Macintosh 840AV and 660AV computers when running system software 7.1.2 or earlier. The ClarisWorks Easy and Custom installer options prevent these components from being installed on these systems. If you have either of these systems, and would like to take advantage of the MacLinkPlus translators provided with ClarisWorks, you'll need to upgrade your system software to version 7.5 or newer before installing ClarisWorks 5.0.

ClarisWorks installs the 68K versions of all the MacLinkPlus for ClarisWorks files and filters on PowerPC as well as 68K computers. There is a known problem resulting from PowerPC versions of MacLinkPlus for Easy Open and Mac OS Easy Open that could cause ClarisWorks to experience difficulties when it is first launched. We have worked around this problem by providing the 68K files.

When opening files using any of the MacLinkPlus or XTND supported file filters, we suggest that you specifically select the "Document Type" and "File Type" to be used in the Open Dialog. Many applications use the same file types for multiple versions of their documents. Attempting to open these documents without specifically selecting the document and file type may cause the application to use a translator for an earlier version and fail to translate the document. If this happens, you'll see the message "Cannot convert to specified document type".

ClarisWorks contains portions of the file translation library of MacLinkPlus, a product of DataViz, Inc.

Claris and the ClarisWorks team thank you for your purchase of ClarisWorks 5.0. Your support, comments, and suggestions help us to continue to bring you better solutions for your future productivity needs.

CLARISWORKS OFFICE NOW AVAILABLE FOR WINDOWS 95, NT 4.0 AND MAC OS

Users of popular productivity tool applaud its tightly integrated architecture, customized business solutions, and Internet capabilities

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

SANTA CLARA, Calif., September 17, 1997 ? Claris Corporation today announced the immediate availability of ClarisWorks Office, the newest version of the company's complete cross-platform productivity solution software for Windows 95, NT 4.0 and Mac OS users. Small, fast and extremely economical, ClarisWorks Office is less than one half the size of other suites, while providing a powerful and full-featured alternative to bloated suite products.

ClarisWorks Office includes the new ClarisWorks 5.0 software, which features Internet enabling and linking, a customizable button bar for faster access to the most used features of ClarisWorks, enhanced HTML translation for quick productivity on the desktop or on the World Wide Web, an easy on-ramp to the Internet with a choice of Internet Service Providers (ISPs); Claris Home Page Lite software for easy authoring of Web pages, and more than 230 ready-to-use documents including JIAN BusinessBasics (Claris Edition), a comprehensive set of small business solutions from the makers of the popular business planning software BizPlanBuilder.

"At a time when the number of companies with less than 20 employees comprise about 90 percent of the business market ClarisWorks Office, with its compact size and exciting new features, sets the office suite standard for todayÕs small business user." said Dominique Goupil, Claris president. "Small businesses need to watch their expenses and really make sure theyÕre getting value for their dollar; for them, ClarisWorks Office fits the bill perfectly."

Designed to deliver all the office needed for small business, home or education users who want productivity but do not have dedicated support technicians to back them up, ClarisWorks has attracted more than 15 million users worldwide with its ease-of-use and award-winning seamless integration of powerful productivity tools. Earlier this year ClarisWorks 4.0 was rated by small businesses as more reliable, easier to learn, offering more value for the money and higher general satisfaction than Microsoft Office in a study by Dataquest, a Gartner Group Company.

Beta tester Jim Erwin, president of sYnapse Software, Inc. in Rochester, New York, believes other office suites are too cumbersome for most small businesses. "ClarisWorks Office is the best piece of software ever created for small business. It combines capability with power and flexibility that's just not matched. All the clumsy office 'bloatware' suites just don't do it for the vast majority of small business people," said Erwin. "ClarisWorks Office is simple, it's powerful, and it has tremendous capabilities ? a database, spreadsheet, word processing, graphics, and macro capability ? all rolled into one extremely well integrated package."

Everything users need for productivity on the desktop and on the Web
With full-featured productivity tools, customized documents, plus the power of the Internet, ClarisWorks Office enables users to create everything from memos to presentations, customer lists to mailing labels, letters to school term papers, custom Web pages to invitations, balance sheets to home budgets, and business reports to family newsletters.

ClarisWorks Office consists of:
ClarisWorks 5.0: The new version of the smartest all-in-one productivity software, which features enhancements to word processing, spreadsheet, graphics and database software; powerful presentation capabilities; and Internet enabling that lets users create links to the Internet from documents ? all in a single, easy-to-use program that offers instant access to all features and the ability to combine words, graphs, tables, photo images, and even video, on a single page.

JIAN BusinessBasics (Claris Edition): More than 60 business documents: agreements, worksheets and checklists covering sales, marketing, finance, accounting, management and operations provide effective, time-saving ways to manage and grow emerging and existing small businesses.

Ready-to-use documents: 175 ready-made customizable ClarisWorks documents including: newsletter layouts, financial worksheets, databases, presentations, Web page templates and more enable any user to instantly create professional-looking documents for business, home or school.

Claris Home Page Lite: Establishing a presence on the Web is simple with this powerful authoring tool that lets users build dynamic Web pages in minutes ? without learning HTML programming.

Internet connection software: Users can be up and surfing, exchanging email and creating a presence on the Internet quickly and easily with a choice of either NETCOM's Internet Suite, NETCOMplete or EarthLink Network's TotalAccess software. Both services include browser software. ClarisWorks Office users who subscribe to NETCOM's SOHO hosting service for six months will receive a free set-up and one free month of service. U.S. users who subscribe to EarthLink's Internet access will receive a free set-up and one free month of access. Canadian users should call EarthLink at 800/395-8410 for special prices.

Right tools at the right time
Rather than bombarding users with thousands of features they must pay for but will never use ?? and that take valuable RAM and disk space ?? ClarisWorks Office presents the tools users need, when they need them, saving time and enhancing productivity. The new fully customizable, context-sensitive ClarisWorks button bar provides users with the appropriate tools for the task and enables them to build their own desktop "control center" with custom buttons for launching other applications, documents, and Web sites. Users can also set up a button bar that will travel with a document ?? so the right shortcuts are there when needed.

ClarisWorks Assistants offer detailed, friendly help with layout, design and content in the automated creation of everything from newsletters and tables to mailing labels and business cards. New contextual help within ClarisWorks makes it simpler than ever to get answers quickly from any dialog box.

The new robust ClarisWorks HTML translator with support for GIF and JPEG images, background images, and tables makes it a snap to create documents for the Internet. Ten new ClarisWorks templates for quickly creating single page Web sites help even the most novice users easily create their own Web pages. And, when users are ready to publish multiple page sites, Claris Home Page Lite offers the Web authoring tools they need.

ClarisWorks 5.0: More power and compatibility plus Internet enabling and linking
The foundation of the ClarisWorks Office product, ClarisWorks 5.0 offers significant new features that deliver more power at users' fingertips. In addition to the button bar which brings one click access to 150 of the most commonly used features, ClarisWorks 5.0 includes an improved text ruler featuring new tab and margin guidelines for aligning text easily and access to text attributes such as font, size and style. Users can also now specify a default font for all their documents and password-protect confidential documents.

The spreadsheet now supports named ranges so users can create easy-to-understand formulas that make data sharing simpler. In addition, the more than 100 functions included in the spreadsheet have been categorized for easier access. As important data comes in many forms, the database now supports multimedia fields including pictures and QuickTime movies. More than 600 new clip art images (over 1100 total) are available to illustrate any ClarisWorks 5.0 document.

Users can now also create Internet-enriched documents that include references and links to Web sites, easily link related documents, and facilitate navigation within larger documents through new Web and document linking capabilities in ClarisWorks 5.0.

When sharing data with associates or friends who use other productivity software such as Microsoft, Lotus, and Corel products, ClarisWorks 5.0 makes it simple with translators created exclusively for ClarisWorks Office by DataViz, makers of the popular MacLinkPlus and Conversions Plus translation products. ClarisWorks 5.0 also continues to be the only productivity suite that delivers complete cross-platform compatibility with no translation required.

Excellent value
ClarisWorks Office has a lower initial retail cost than traditional suite products and its usability and integration are designed to lower training and support costs as well. ClarisWorks also continues to require modest computing power: 8 MB RAM and 68 MB of disk space for a full install including all clip art and templates, less than one half the disk space of Microsoft Office 97, so users are much less likely to require costly hardware upgrades to be productive.

The U.S. estimated retail price for the Windows 95/NT 4.0 version of ClarisWorks Office is $79, with an upgrade/trade up rebate of $20. The U.S. estimated retail price for the Mac OS version is $99, with an upgrade/trade up rebate of $30. U.S. users of previous versions of ClarisWorks can upgrade to just ClarisWorks 5.0 for $49.

Availability and system requirements
Windows systems require Microsoft Windows 95 or NT 4.0 and a 386 or newer processor; Macintosh requirements are Mac OS System 7.0.1 or later and a 68020 or newer processor. On all platforms, ClarisWorks Office requires a CD-ROM drive and 8 MB of RAM and 21 MB of hard disk space for a minimal installation.

For more information, call 1-800-544-8554 or visit the new ClarisWorks Office Web site at http://www.claris.com/clarisworks. ClarisWeb, the Claris World Wide Web home page, is located at http://www.claris.com.

Claris is among the world's largest vendors of productivity software for personal computers, based on total revenue. Claris Corporation, a leading vendor of cross-platform software for business, education and home, has headquarters in Santa Clara, Calif. Note to editors: Visit the Claris media center on the Web at http://www.claris.com/news/press.

Fonts Included with ClarisWorks 5.0 for Macintosh

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks 5.0 for Macintosh installs the following seven fonts:

Arial MT Cn Lt
Bodoni MT Ultra Bold
Gill Sans Condensed Bold
Klang MT
New Berolina MT
Old English Text MT
Script MT Bold

The following two terminal emulation fonts are installed for use with ClarisWorks Communications documents:

TTYFont
VT102Font

All nine of the above fonts are installed in the Fonts folder within your System folder.

Published Date: Feb 18, 2012

Fonts Included with ClarisWorks for Kids

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks for Kids 1.0 installs the following three fonts:

Early Learner
SchoolScript
SchoolText

The latter two are contained in a font suitcase called SchoolFonts.tt. All of these fonts are installed into the Fonts folder within your System folder.

Updated Windows 95 Driver For The HP LaserJet 5 Family Seems to Reduce Printing Errors

There is a PCL driver available from HP that is compatible with Claris software running under Windows 95. It is compatible with the LaserJet 5, 5L, 5M, 5N, 6P & 6MP.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The standard PCL (printer control language) driver version G1.30 is available for the HP 5, 5L, 5M, 5N, 6P & 6MP laser jet models. The actual version of the new driver is G1.30 (PCL). If you have been experiencing problems printing to an HP 5 series driver we recommend installing this latest version. You can find version information for your currently installed HP 5-family driver by following these steps:

1) Click the Start button, choose Settings, then Printers
2) Right-click on your HP driver and choose Properties
3) Click on the Device Options tab
4) Click on the About button

Anything prior to version G1.30 may be incompatible with Claris software.

The driver is available on the Hewlett-Packard website, www.hp.com. The specific URL for the the LaserJet 5L page is http://hpcc923.external.hp.com/cposupport/indexes1/lj5ls.html.

Once you download the compressed driver archive to your hard drive, expand it into its own folder. Proceed with a normal installation of a new printer (Start, Settings, Printers, Add Printer), and when you get to the list of manufacturer's, click on Have Disk. Navigate to the folder where you expanded your archive and it will install the new driver.

You can also just change your existing installation of any printer driver by doing the following:

1) Click on Start, Settings, Printers.
2) Right-click on your installed HP driver and choose Properties.
3) Click on the Details tab.
4) Click on the New Driver button and proceed as described in the previous paragraph to the list of manufacturers and the Have Disk button.

Troubleshooting Windows Printing Issues (Errors Or WYSIWYG)

This article is designed to be the one-stop shopping for your Windows printing troubles -- whether you're getting an error or not getting what you want (WYSIWYG).

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Are you getting an ERROR?

-- Exception 10h:

Switch to a driver that ships with Windows 95 - usually the same model printer, but try one lower family number. [Example: HP LaserJet 5si and HP LaserJet 4si]

or

Turn off the Math Coprocessor :
1. With your right mouse button, click My Computer, and then click Properties.
2. On the Device Manager tab, click View devices by type.
3. Double-click System Devices.
4. Click Numeric Data processor, and then click Properties.
NOTE: With a Plug and Play bios, the Numeric Data Processor option will be under a Plug and Play branch in the Device Manager rather than at the top level.
5. On the Settings tab, click Never Use The Numeric Data Processor.
6. Click OK.
7. Restart your computer.

-- Divide Error:

Switch to a driver that ships with Windows 95 - usually the same model printer, but try one lower family number. [Example: HP LaserJet 5si and HP LaserJet 4si]

-- "Cannot Access Print Options":

This usually only occurs in FileMaker Pro 3.0v1 and 3.0v2. It was fixed as of v3, so updating their FMP application is the solution.

Are you getting printed out what you see on-screen (WYSIWYG)?

-- Text Clipping:

In FMP versions 3.0v3 and later, go to layout mode and hold the Shift key down while accessing Mode, Layout Setup. A New Break checkbox will appear in the dialog box. Check it and see if that does it.

If the above doesn't work, remain in Layout mode, select the text field that is getting clipped and go to Format, Line Spacing and choose Custom. Switch the Lines to Pixels and lower the default number of 16 to something like 13. Switch to Preview mode and check it out.

-- Solid Black or Shading instead of Pattern Fill:

If you are printing to an HP 4 (most models), you likely need to switch your printer's graphics mode from raster to vector or vice versa. This is done in the printer's properties. Click on Start, choose Settings, then Printers. Right-click on your printer and choose properties from the pop-up menu. Click on the graphics tab, where you'll see the radio buttons for raster and vector graphics. Whatever it is set to, choose the other one.

Text Color Can Only Be Changed From Button Bar

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

In previous versions of ClarisWorks, the color of a text selection in a word processing document could be changed via the 'Text Color' option in the 'Style' menu. This option no longer exists in ClarisWorks 5.0, and has been replaced by a Text Color palette on the button bar.

The color of text within a text frame in a Word Processing document can be changed under the 'Format' menu if the entire frame is selected as an object, as in previous versions of ClarisWorks.

The text color of cells in a ClarisWorks 5.0 Spreadsheet document can still be changed by choosing 'Text Color' in the 'Format' menu.

The color of text within a field in a ClarisWorks database document can be changed under the Format menu as well as in Layout mode.

The ClarisWorks help system incorrectly states that the color of text in a Word Processing document can be changed in the 'Style' menu.

Published Date: Feb 18, 2012

Bookmarks Do Not Appear In New Document Window

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When creating links to bookmarks in the same document, you must be sure to leave the default document setting to '<Current Document>'. If you try to select the document you are working in by hitting the 'Choose Document' button, the bookmarks you created will not be available to you. This scenario only happens when the document has been saved first. Newly opened documents that have not been saved will not show in the 'Choose Document' window, thus avoiding the entire issue.

Underlined Space Characters Do Not Print In ClarisWorks 5.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When creating underlines in ClarisWorks 5.0, selecting 'Underline' in the Styles menu and then using the space bar to place the line in your document has been found to not print the line created. The problem also occurs when documents created in older versions of ClarisWorks are used in ClarisWorks 5.0. Lines created by either option spaces or tab spaces will print. As of yet, there is no solution to correct the problem.

It is recommended that you not create underlines in this fashion. The best way to make long underlines is by creating a tab and setting the tab to have a fill of the underline character. This can be done by double clicking on the tab after it is created. You could also create a plain tab and use the drawing tool to draw in a line as well.

Movies Don‘t Play Correctly When Using QuickTime 2.5

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When using ClarisWorks versions 2.0, 2.1,3.0 and 4.0 with QuickTime 2.5, QuickTime movies won't play correctly in the Slide Show. The movie soundtrack plays correctly, but the display only shows the first frame of the movie. To have movies play correctly in these versions of ClarisWorks, use QuickTime 2.1.

ClarisWorks 5.0 works correctly with QuickTime 2.5, which is supplied on the ClarisWorks Office CD.

ClarisWorks 5.0 Upgrade Comes with Two CDs

When you purchase ClarisWorks 5.0 you'll receive two CDs, but only one license.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
ClarisWorks 5.0 is available as an 'application only' Upgrade or as a new Retail product which includes the application, some added ClarisWorks templates, Claris Home Page Lite, and additional 3rd party items such as Jian Business Templates and some Internet Service Provider software.

If you own an earlier version of ClarisWorks, you have an option to buy either the Upgrade or the Upgrade and the content of the Office product. If you qualify, the second offer allows you to get the same extra items which a new ClarisWorks Office Retail customer gets, but at a price "net" the Retail in-box rebate.

If you buy the Upgrade CD and the ClarisWorks Office CD through our upgrade mailing offer you are entitled to one license of the ClarisWorks 5.0 application even though you will get two CDs. Each CD has the ClarisWorks 5.0 application, but only the Office CD has the added items. So, if you purchase both the ClarisWorks 5.0 Upgrade CD and the ClarisWorks Office CD, you will receive two copies of ClarisWorks 5.0 (one copy ships on each CD), however, having a second copy of ClarisWorks 5.0 does not constitute the grant of a second software license. You can install from either or both CD's, however, you are allowed legally to use only one version of ClarisWorks 5.0.

To get the benefits of having purchased the Upgrade with the Office content, it is recommended that you follow these procedures:

1. If you haven't already installed ClarisWorks, the best advice is to install from the Office CD, and to put the 5.0 CD away in storage should something happen to your Office CD.

2. If you have already installed from the 5.0 CD, you can do a custom install of ClarisWorks from the Office CD to get just the extra templates. Everything else on the Office CD (Home Page Lite, Internet Service Provider software, trial applications) has its own installer, so you can make individual decisions about which of these items you want to install.

For purchasing information and detailed Spec Sheet of ClarisWorks Office 5 go to the **Apple Store** on line at http://store.apple.com/

Q & A About DataViz Translators in ClarisWorks 5.0 and the Mac OS

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Question: Why are 68k versions of DataViz filters installed when installing to a computer with a PowerPC processor, even when selecting Custom Install and choosing "ClarisWorks for my system"?

Answer: The ClarisWorks Office installer works as designed, including installing the PowerPC-native version of the application on machines with PowerPC processors.

The installer installs the 68k version of the filters we have licensed from DataViz regardless of the machine's processor type. This is deliberate and is due to a problem with the Mac OS that can cause the PowerPC versions of DataViz's filters to crash the system.

Question: What should be done with the versions of the MacLinkPlus Setup Control Panel and MacLinkPlus extension that were previously installed with Mac OS/8? Should these be disabled in favor of the ClarisWorks pair or used in combination with them?

Answer: There is no need to do anything with any previously installed versions of the MacLinkPlus Control Panel or Extension in order for ClarisWorks Office to function properly. The Apple and Claris versions of these Control Panels have overlapping, but not identical settings. Each Control Panel can be used to change the settings unique to that Control Panel. For settings common to both, changes in either Control Panel will be be reflected in both and used by any application translating a file via a DataViz filter.

Question: What about the files in the DataViz folder within the System folder? Should they be merged with the files in the DataViz folder that is inside the Claris folder within the System folder?

Answer: In most cases, the number of filters provided from installations of MacLinkPlus or Mac OS/8 are larger than the subset of filters we have licensed and provide in the ClarisWorks Office installation. Therefore, it is not recommended to delete these filters as it could result in the loss of filters not provided in ClarisWorks Office. ClarisWorks translators are located within the Claris folder in the System folder, but other applications do not look in this location for translators. Therefore, previously installed DataViz translators, and the Claris translators, should be left in their original locations.

Step Size for the X Axis Tickmarks Won‘t Change

In a ClarisWorks Spreadsheet, you can enter a Step Size value for the tick marks for the X axis, but that axis is for labels and the tickmarks simply delineate the labels

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

The tickmarks on the X axis of a line chart in ClarisWorks represent the names of your series. If you have no names for your series it will default to labeling them numerically.

Those numbers are still the names of a series and those names are divided by tickmarks. Therefore ClarisWorks will not change the number of tickmarks that are displayed, even though you have filled in the Step Size box in the Axes dialog.

It looks deceiving because there are numbers and it would look as if you could treat them as numbers. In reality they are names and can't be manipulated.

If you want to achieve this look, you can use a column to put names for the X axis and simply leave some of them blank.

For example if you wanted every fifth one labeled you could enter this column:

1
(blank cell)
(blank cell)
(blank cell)
5
(blank cell)
(blank cell)
(blank cell)
(blank cell)
10

etc.

New Document Buttons Fail to Use Options (Default) Stationery

Using the buttons will create a standard ClarisWorks file, with none of your custom formatting

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If you create an "options" or default stationery file, the settings you establish in that file will be used every time you create a new file of that type (word processing, spreadsheet, etc.). So, if you create, for example, a word processing options stationery file with the margins set to 1.5 inches, every time you choose Word Processing from the New Document dialog box, an untitled document will be created that has 1.5 inch margins (as opposed to the ClarisWorks default standard of 1 inch margins).

Normally, if you use the New Document Buttons in the Button Bar to create a new file (instead of using the menu command), ClarisWorks will, as would be expected, also use the stationery file to create a new blank file with your preferred settings. However, if you have or had ClarisWorks 3.0 (or an earlier version) on your computer, the buttons in the Button Bar may create new files that do not contain your custom modifications.

This is due to the fact that the button is looking for your options stationery document in a folder called "ClarisWorks Stationery." In ClarisWorks 3.0 and earlier, this folder was stored on your hard drive inside the Claris folder, which is within your System folder. In ClarisWorks 5.0 (and 4.0), this folder is located within the ClarisWorks program folder. If you still have a ClarisWorks Stationery folder in the Claris folder within your System folder, the buttons in the ClarisWorks 5.0 Button Bar will look there for the file, instead of looking for the ClarisWorks Stationery folder within the program folder.

To correct the situation, you can move, rename or delete the ClarisWorks Stationery folder in the Claris folder within your System folder. If you are no longer using your previous version of ClarisWorks, it is recommended that you delete the old ClarisWorks Stationery folder. If you want to continue to have access to these files, you should move the folder out of the Claris folder or give it a different name. If you do either of these, when you use ClarisWorks 3.0 you will no longer see the available stationery files when clicking on the option to "Start with an Assistant or Stationery" in the New Document dialog box. However, if you choose Open from the File menu and navigate to the location of your old ClarisWorks Stationery folder, you will be able to open and use all of the stationery files in that folder. In ClarisWorks 5.0, all of the stationery files will continue to be available in the New Document dialog box, and the New Document buttons will utilize your options stationery file as expected.

NOTE: For more information on creating and using default (options) stationery files, open the ClarisWorks Help Index, type the word "stationery" and select the desired topic, particularly "Set up default fonts and formatting."

Cannot Re-Open Saved Document

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If a customer is unable to open a previously-saved document, check to see if they have (or have had) Deneba Canvas version 5.0 installed. A problem with the installer for that program makes ClarisDraw files unopenable.

To fix further occurrences of this problem:
1. Download the updater from the Deneba website www.deneba.com
2. Quit the Claris application, then trash the Claris Fonts file.

To fix files that have already been damaged:
Open the file using Norton Disk Editor. In an untouched ClarisImpact or ClarisDraw document, the third "word" (set of 2 characters) will be D0 (that's D-zero). However, in a corrupted file, the third "word" will be 00 (a null value). Simply changing this word back to D0 will fix the problem.

ClarisDraw 1.0v4 Updater: Important Information

This is the Read Me included as part of the ClarisDraw 1.0v4 Updater.

Important: There is no ClarisDraw 1.0v4 Updater for Windows, the latest update for Windows is ClarisDraw 1.0v3.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

Note: This article mentions software updates. You may search for software updates in the Software Updates Library at following URL: "**http://asu.info apple.com/**"
This article has been archived and is no longer updated by Apple.
This file contains last-minute information that will help you get more from ClarisDraw. You will also find important tips in the "Troubleshooting" section of ClarisDraw's onscreen Help.

Hard Disk Space Needed During Installation
To save hard disk space, the "Easy install" option places all ClarisDraw files and only a minimal set of ClarisArt files on your hard disk. To install all of the ClarisArt files, relaunch the Installer, go to "Custom" install, and select the 'ClarisDraw ClarisArt' option.

During installation, ClarisDraw will temporarily require more hard disk space than it needs after installation is completed. This is because, during installation, the ClarisDraw Installer places compressed copies of the ClarisDraw files on the hard disk, then makes decompressed copies of these files. Once installation is successfully completed, the Installer automatically deletes the compressed files and leaves only the new, uncompressed files for your use.

Power Macintosh Installation
The "Easy Install" option places on your hard disk the appropriate Macintosh or Power Macintosh version of ClarisDraw, depending on the Macintosh being used. If you'd like to install both the Macintosh and Power Macintosh versions on any machine, use the following steps:

* Use the Easy Install option to install one complete set of files, then Quit the Installer.

* Open the 'ClarisDraw Folder' that was just installed and rename the ClarisDraw application appropriately (example: 'CD Macintosh' or 'CD Power Macintosh')

* Open the Installer a second time, choose "Custom" and select either 'ClarisDraw Application Macintosh' or 'ClarisDraw Application Power Macintosh', depending on the version previously installed.

When this installation is completed, both applications will be located in the same folder and will use the same auxiliary files.

Important: The Power Macintosh version will not run on a conventional Macintosh (68K).

Memory
Occasionally in low memory situations an alert will appear stating "There is not enough memory to complete this operation". This is particularly common when working with paint frames, and is typical of any application with a paint feature. We suggest saving your document before continuing. If you are working with large documents and find yourself in this situation frequently, we suggest increasing the application's memory partition as described in the ClarisDraw onscreen help, or your Macintosh User's Guide.

Bad Fonts
ClarisDraw tests for bad fonts when the application is first opened. It also tests for bad fonts when opening the application after fonts have been added to your system. ClarisDraw creates a 'Claris Fonts' file which is used to display fonts in their actual typeface in the Font menu. If ClarisDraw encounters a bad font, or one that it cannot correctly add to the Claris Fonts file, an alert is displayed indicating that some fonts may be bad. These fonts will be listed in a 'Bad Fonts' text file in the Claris Folder, which is located in your System Folder. Additionally, these fonts will be displayed in the Chicago font in ClarisDraw's FONT menu. We suggest removing or replacing these fonts from your system before using ClarisDraw. Refer to the manual that came with your Macintosh for instructions on how to remove or replace these fonts. Once these fonts have been removed or replaced, throw away the 'Claris Fonts' file, also located in the Claris folder, and open ClarisDraw.

There may be some fonts that work properly in ClarisDraw and still fail our tests. The only difference between these and other fonts is that they will be displayed in the Chicago font in the FONT menu. However, we suggest performing the following simple tests on these fonts before using them in the application:

1) Create some text in ClarisDraw and apply the font. If the application unexpectedly quits, this font is bad and should be removed or replaced immediately.

2) If the application does not quit when the font is applied, create multiple pieces of text, apply several different font sizes, and print the file. If the font appears correctly on screen and when printed, then there is no need to replace or remove this font.

Exporting Documents with Bezigons Created from Text
If you create a document that includes bezigons created from text, and then save this document in EPSF, CGM, MacDraw Pro or MacDraw II format, you may see extra lines in the converted document, both onscreen and when printing. This is a limitation of Apple's "QuickDraw" object-drawing technology.

Opening or Saving Color Palettes
ClarisDraw ships with several specialized 256-color palettes. You can access these palettes by opening them from the "Colors & Gradients" dialog box in the LAYOUT menu. Make sure that you select the 256-color palette first; the "Open" and "Save" buttons will then become available.

Illuminated Letters Library
If your drawing includes objects from the Illuminated Letters library, and you need to scale these letters, for best results do not resize a letter by manually stretching it. If you do that, the letter or number background will scale accurately, but the enclosed letter or number will not because it is an actual piece of text. Instead, use the "Scale Selection" feature from the ARRANGE menu, with the "Scale text" option selected.

Claris periodically issues maintenance releases of shipping software applications. A maintenance release is identified by v2, v3, v4, etc. numbering. The improvements made in each new version are included in this package and are detailed below.

ClarisDraw 1.0v4 Detailed Improvements

*Corrected a problem saving files to drives with greater than 2 Gigabytes available space.

ClarisDraw 1.0v3 Detailed Improvements
Better Integration with ClarisDraw for Windows

* ClarisDraw for Windows files (.cdd and .cdt) open directly from the Open File Dialog
* Wrapped text created in ClarisDraw for Windows appears correctly
* Improved import of graphics with rotated and grouped objects from ClarisDraw for Windows
* When ClarisDraw 1.0v3 is launched for the first time, a text file is created in the Claris folder named Claris Font Map, containing the following entries:

- Arial=Helvetica
- Courier New=Courier
- Fixedsys=Monaco
- Modern=Helvetica
- MS Sans Serif=Helvetica
- MS Serif=Times
- Script=Geneva
- Small Fonts=Geneva
- System=Geneva
- Terminal=Geneva
- Times New Roman=Times
- Wingdings=Cairo

A font named on the left in a ClarisDraw for Windows document will be mapped to the corresponding Macintosh font named on the right when opened in ClarisDraw 1.0v3. This list may be edited and augmented as needed by the user.

Improved Translation of MacDraw Pro Files
* Landscape documents import as landscape
* Spell checking imported MacDraw documents works correctly
* Text objects maintain correct text wrap
* Rotated text objects import correctly

System Conflict
* Memory is properly managed so closing Desk Accessories after use no longer causes a operating system conflict.

Miscellaneous
* Resizing multiple lines with arrows at end retains correct arrow orientation
* Fixed a problem printing the ClarisDraw help files to Hewlett Packard printers
* Improved printing multiple documents from the finder
* Drag selecting text now also selects the last character
* In the first row of text, up arrow goes to beginning of line
* In the final row of text, down arrow goes to end of line
* Corrected map of Japan in ClarisArt library

* Corrected images in the code flags and map symbols libraries

ClarisDraw 1.0v2 Detailed Improvements
Improved Translation of MacDraw Pro Files
* Text blocks import with correct size, and without wrapping
* Document size and page orientation information are properly imported
* Extremely fine pen sizes import at ClarisDraw's minimum available size, rather than being imported at a pen width of zero.
* MacDraw II and MacDraw Pro documents with rotated polygons import with all polygons accurately placed
* Objects in MacDraw Pro files opened in ClarisDraw for Power Macintosh print properly to Postscript printers.
* MacDraw Pro files containing PICT objects import completely and with correct size and proportion

Improved compatibility with ClarisImpact
* Imported ClarisImpact files retain correct ruler settings
* ClarisImpact files with rotated models, groups or tables import properly
* ClarisImpact files with all objects locked import properly

Import and Export Improvements
* Text in files saved as a PICT, then reopened and ungrouped, retains its proper color
* Pen size is properly translated when exported to CGM format
* Arrowheads properly export to CGM format
* Inappropriate "insufficient memory" error dialog eliminated when saving large PICTÊfiles as MacDraw II or MacDraw Pro.
* Resolution of bitmapped images properly preserved when exporting to MacDraw II or MacDraw Pro
* Black and white (one-bit) files export to EPSF with only the necessary information, so they remain reasonable in size
* White text, copied to the Clipboard along with colored text, does not change the way colored text is displayed on screen after you switch to the Finder and back
* QuickTime movies export properly

Improved Printing
* Print range settings work properly with slides and handouts
* Rotated, colored text prints properly with the Apple LaserWriter 7.x driver
* Polygons and bezigons print and display properly when exported or copied from ClarisDraw, then imported or pasted into other applications and printed to a Hewlett-Packard DeskWriter printer

System Conflict
* Pop-up tools are now properly available when using System 7.1 on a Macintosh Plus, SE, Classic, PowerBook 100, or Portable

Miscellaneous
* The CommercialPi BT font displays correctly in the Font menu and in text
* ClarisDraw properly launches with a wider variety of corrupted fonts installed
* Proper line spacing is preserved even if a single line of text contains characters of varying point sizes, and line spacing is changed to a measurement other than Lines
* Objects snap correctly to the grid under a wider variety of situations
* Screen objects display properly after using the spellchecker while viewing the Master Slide
* Colors in the gradient editor display properly when in paint mode with a paint frame set for thousands or millions of colors
* Library object "thumbnails" retain their proper size in Name View
* After installing this updater, ungrouping text pasted from external clipboard will no longer change the font to Geneva
* Needed to run the updater are:
- 3 MB of disk space
- 2 MB of RAM

*This version will not update the Canadian version of ClarisDraw.

Word 6 Translation Problems in ClarisWorks 5.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Under certain circumstances, which are currently under investigation, the Word 6 translator does not show up in the ClarisWorks 5.0 Mac translator list, and Word 6 files cannot be opened using File/Open. In most cases, this occurs on machines that have or had Word 6 installed, though there have been unconfirmed reports of this problem manifesting itself on Word-free systems.

Claris Engineering is aware of this issue and is looking into it. In the meantime, the workaround is to drop-launch the Word 6 file onto the ClarisWorks 5.0 application. This will open the file using the correct translator.

Also, though "MS Word 6" does not show up in the Save As dialog box either, using the "MS Word [MacLink]" translator listed in the ClarisWorks 5.0 Save As pop-up will correctly translate the file into Word 6 format.

Conflict with Instant Organizer and the ClarisWorks 5.0 Installer

YouÕll have to restart your computer after installing ClarisWorks 5.0.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
There is a conflict with Instant Organizer and the ClarisWorks 5.0 installer on machines running System 8.0.

The conflict has two results:
1) At the end of installation, when the installer brings up the continue, quit, restart dialog, you will get a Type 10 error which will force you to restart. In spite of this error, the installation of ClarisWorks is correct and complete.

2) The ClarisWorks installation will finish, but some of the desktop elements will not be displayed. If you quit the installer but do not restart, your machine will be in an unstable state.

Restarting your computer after installing ClarisWorks 5.0 will return your machine to its normal state and allow you to use ClarisWorks and Instant Organizer.

GIFs with Transparent Background Print or Export as Black

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Problems:
1- GIF images brought into ClarisWorks that have transparent background pixels print as solid black.
2- if you export to a PICT file, then open the PICT file in another program, the images will appear solid black.

An example of how this problem can be created:
1- Open a web page in Netscape 4.03 with a gif image with a transparent background, such as www.claris.com

2- Open a blank ClarisWorks 5.0 drawing document

3- Copy/paste the image from Netscape into ClarisWorks. Or, drag-and-drop the image into ClarisWorks. The image will appear correct on screen. If the image has transparent pixels, you'll see the drawing grid behind the image.

4- Print using either the LaserWriter 8 driver or the HP DJ 800 Series driver. The GIF image prints as solid black.

5- Save the document as a PICT file, then open the PICT file in another program, such as MacDraw Pro. The GIF image appears solid black on screen.

As of this writing, earlier versions of ClarisWorks prior to 5.0 have not been tested for these problems. We have no workaround at this time.

JIAN BusinessBasics, Claris Edition

These are the additional stationary documents that ship with ClarisWorks Office 5.0.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
JIAN BusinessBasics, Claris Edition comes to Claris customers from the makers of the world's #1 selling business plan software ◆? BizPlan Builder. JIAN BusinessBasics includes essential tools for time-pressured business people. Below are the time-saving letters, documents, checklists forms and templates in the areas business owners need most help:
- Finance and Accounting
- Management and Operations
- Sales and Marketing

These files are all installed with ClarisWorks Office. You can find and use them as you would any Claris stationery document. Simply follow the directions for stationery found in HELP or the User's Guide.

ClarisWorks: Text Pastes With Wrong Font

In ClarisWorks 5.0, the font pasted was not the font copied.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Knowledge Base.
This article has been archived and is no longer updated by Apple.
In some situations in ClarisWorks 5.0, you may find that the font that is pasted is not the same font that was copied. This will occur if the data that you are copying was originally from a ClarisWorks 4.0 document.

An example of how this problem is created:

1. Create a document in ClarisWorks 4.0 using the same font as the default font in ClarisWorks 5.0.
2. Save the document and open it with ClarisWorks 5.0.
3. Copy a selection of text and paste it elsewhere within the document. The text will appear in Helvetica, regardless of what the font should be.

Note: This only occurs in documents created in ClarisWorks 4.0 then opened in ClarisWorks 5.0.

Workaround:
Ignore the font used while pasting text. After editing, choose 'Select All' and change to your desired font.

After Installing with OS 8, Computer Loops on Restart

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you install ClarisWorks 3.0 on a computer running OS 8, you may run into a problem. After the installation when you click the Restart or Quit button, your computer will start up or try to go back to the Finder, then it will go into an endless loop.

Restart the computer and the computer should start up normally and work correctly. The installed copy of ClarisWorks 3.0 should function correctly (although it has not been tested for compatibility by Claris).

The problem may be an incompatibility between OS 8 and the Installer Cleanup extension that's installed by the ClarisWorks 3.0 installer into the Extensions folder. You can restart the computer with extensions off and delete the Installer Cleanup Extension manually.

A/UX: Sendmail Problem (9/94)

Configuration

Macintosh IIfx with 8MB RAM
2 HD80 SC (external)
EtherTalk NB Card
A/UX 3.0

The kernal was generated with:

newconfig ae6 bnet appletalk

AppleTalk is connected and functioning; however, the system is not yet connected to an Ethernet network.

Problem

On startup, a core dump file (86016 bytes) is created in the root directory, and a ps -ef shows that "sendmail" is not running. No relevant message appears in the A/UX System Console Window. Using the UNIX command "strings" on /core gives this as the first two lines:

sendmail
/usr/lib/sendmail -bd -q30m

from which I deduced that sendmail has crashed during system initialization. Logged in as root, I issued the command:

/usr/lib/sendmail -bd -q30m

and the system replies:

"Illegal instruction - core dumped"

Can you help?

This article has been archived and is no longer updated by Apple.
During our testing, A/UX 3.0 seems to start the sendmail successfully.

From the error message you got, it seems that the frozen sendmail configuration file (/usr/lib/sendmail.fc) was bad. Have you ever modified the sendmail configuration file (/usr/lib/sendmail.cf) and correctly rebuilt the frozen file?

Note that the /usr/lib/sendmail, /usr/ucb/mailq, and /usr/ucb/aliases files are all hard-linked together with the mode of -rwsr-x-rx root bin 128216 sendmail.

Try to use the "-bt -dX" option to debug the problem. X is the debugging flag list. Each flag has a number and a level; for example, -d3-19.4 sets debugging flags from 3 through 19 and a level 4.

Normally, the sendmail is started up from the /etc/inittab, but to rebuild the frozen file and restart the sendmail:

1) Kill the sendmail process if it is running.
2) Do /usr/lib/sendmail -bz
3) Do /usr/lib/sendmail -bd -q30m

Exported ClarisWorks 5.0 Outline Styles Import into Other ClarisWorks 5.0 Documents Incorrectly

If you export an outline style from a ClarisWorks 5.0 document, then import it into a different ClarisWorks 5.0 document and choose "replace all styles with same name", the imported outline style will be incorrect.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Problem:

I modified the outline style called "Harvard" in a ClarisWorks 5.0 document. Now I would like to import that style into other ClarisWorks documents. I exported the style from the original document and then opened other documents and imported the style. Now when I look at the stylesheet after the import, it shows "Harvard" as one of my styles, but when I edit the style I see that where the original had 12 levels, called "Level 1", "Level 2", etc. the newly imported style has 12 levels, each one called "Level 12". I tried the same thing with the "Legal" outline style, and the import yields a style called "Legal" that has 10 levels, each called "Level 10". Each of the 10 "Level 10" options have no style information in them.

Explanation:

This issue only arises if the "replace all styles with same name" checkbox is selected when importing an outline style with the same name as an existing outline style. If this box is deselected and a new outline style is imported, it will contain the correct information for that style.

Out of Memory in ClarisDraw for Windows when Using a ClarisDraw for Macintosh File

An 'Out Of Memory' error message can occur when transferring a file from the Macintosh version of ClarisDraw to the Windows version if a Macintosh desktop picture is included in the file.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
ClarisDraw for windows cannot import desktop images that are available in Mac OS 8 from the Macintosh version of ClarisDraw. The only available workaround is to create a paint frame in the original file on the Macintosh and to paste the desktop image into it. Once the file is moved over to the Windows platform the image will be visible.

The Windows Metafile Translator does not Save Line Widths Correctly in ClarisDraw

When saving a drawing from ClarisDraw as a Windows metafile (.wmf), certain line widths are not saved correctly.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

In ClarisDraw, you have the ability to create a line using the option 'hairline'. A hairline in ClarisDraw has a point size of 0.01, which hypothetically is the narrowest line size than can be created. When saving a copy of a ClarisDraw file as a .WMF file, with any line width lower than 1, it will be converted to a 1 point line. This is due to a limitation of the .WMF translator and currently, there is no workaround.

ClarisDraw 1.0 ReadMe

This is a full text version of the ClarisDraw 1.0 readme file.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

WELCOME TO CLARISIMPACT 2.0!

Thank you for choosing ClarisImpact¨ 2.0. This Read Me file documents some additional tips that may prove helpful when using ClarisImpact 2.0. This document provides information on:

I. Technical notes and tips
II. Great features of ClarisImpact 2.0

I. TECHNICAL NOTES AND TIPS

A. Installation

Follow the instructions in the installation guide to install ClarisImpact. You can't copy the files to your hard drive using the DOS copy command, because the files are compressed to fit on fewer disks. The setup program decompresses files during installation.

You must be running SMARTDRV.EXE to install ClarisImpact. Claris recommends using default values for SmartDrive.

ClarisImpact is a 32 bit application. Before installing ClarisImpact on a computer running Windows 3.1 or Windows for Workgroups 3.11, you must install Win32s, which is included in this package. Note: If you are using Windows 95, do not install Win32s.

Some virus checking software may interfere with the installer and prevent a complete installation. If you have trouble installing, turn off any virus checking software before starting the ClarisImpact Installer. You can turn virus checking back on after installation is successful.

You cannot start ClarisImpact from a directory whose name contains upper ASCII characters (for example □, ©, £). This is a limitation of Win32.

B. Out-of-memory error messages

If you encounter an error message that indicates there is not enough memory to perform an operation, Claris recommends:

- adjusting your Virtual Memory setting (see Performance tips for Windows 3.1 and Windows for Workgroups 3.11 below)
- removing any unnecessary drivers and TSRs from the CONFIG.SYS file to free up more memory in DOS
- closing other applications and ClarisImpact documents that are running in the background

C. Performance tips for Windows 3.1 and Windows for Workgroups 3.11

32-bit applications such as ClarisImpact 2.0 require that Virtual Memory is on. To improve performance on computers with 8 MB of memory or less, Claris recommends setting virtual memory to permanent and using the suggested size for your virtual-memory setting as displayed in the Virtual Memory dialog box. This value is typically twice the size of physical memory, but should be at least 11,700 K or 11.7 MB.

To set virtual memory:

1. In the Program Manager, open the Main Group, double-click the Control Panel icon, and then double-click the 386 Enhanced icon.
2. Click Virtual Memory and then click the Change.
3. Select Permanent from the Type pop-up menu.
4. Click the checkbox next to Use 32-Bit Disk Access. Note: This setting is NOT recommended for laptops running on battery power.
5. Click OK.

If the suggested size of virtual memory is less than twice the physical memory installed on your computer, you might need to increase your free disk space by removing unwanted files or defragmenting your hard disk. Note: DOS 6.0 users can use DEFRAG.EXE.

If you are an experienced Windows user and you have adjusted your virtual memory settings as described but still feel your performance could be improved:

- In DOS, run:

DEFRAG

- In DOS, run:

MEMMAKER

- Change the following settings in the CONFIG.SYS file:
FlLES=60
STACKS=9,256

- Add the following line to the CONFIG.SYS file:
BUFFERS=10

- Add the following line to the [WINDOWS] section of the WIN.INI file:
DefaultQueueSize=16

- Add the following lines to the [386enh] section of the SYSTEM.INI file:
DMABuffersize=64
XLatBufferSize=128
MaxBPS=768

- Delete the following lines from the [386enh] section of the SYSTEM.INI file:
EGA80W0A.FON...
EGA40W0A.FON...
CGA80W0A.FON...

CGA40W0A.FON...

- Always use SmartDrive!

D. Printing
If you have trouble printing, try installing an updated printer driver, available from your printer manufacturer or Microsoft Corporation. For instructions on installing a driver and configuring your printer, see the the Control Panel documentation in the Microsoft Windows User's Guide.
ClarisImpact requires a valid default printer driver, NOT the Generic/Text Only driver. To select or change the default printer:
1. In the Program Manager, open the Main Group, double-click the Control Panel icon, and then double-click the Printers icon.
2. Select a printer from the Installed Printers list and click Set As Default Printer. If no printers appear in the list, see your Microsoft Windows User's Guide for instructions on installing printers.

E. Video cards and drivers
If your screen doesn't display objects correctly, you may have a problem with your video driver. Try changing the resolution to 640x480 or 800x600 or try changing the number of colors displayed (for example, 256, 32K, millions of colors).

To verify a video driver problem, change the video driver to Windows standard VGA and run ClarisImpact. If the problem disappears, contact the video card manufacturer for the latest version of the video card driver or use the driver that is included with the Windows installation.

F. ClarisImpact INI file settings
If you experience either of the problems listed below, make the suggested changes to the [ClarisImpact] section of the CLARIS.INI file in your Windows directory:
- Problem:
Color/gradient palettes do not draw completely, or show up with black or missing colors/gradients
Suggested setting:
Cache Palettes = 0

- Problem:
Tools are not drawn correctly, or display as black
Suggested setting:
BitmapTools=0

G. Fonts

If fonts do not display or scale correctly (for example, they are clipped or overlap), Claris recommends:

- Making certain a valid printer driver is selected as the default
and that is it NOT the Generic/Text Only driver
- Enabling TrueType fonts (see below)
- Making certain the standard Windows fonts, such as Arial, are
properly installed

To delete or reinstall standard Windows fonts, see the Microsoft Windows User's Guide.

To enable True Type fonts:

- In the Program Manager, open the Main Group, double-click the
Control Panel icon, and then double-click the Fonts icon.
- Click TrueType, and then click Enable TrueType Fonts.

H. Sharing files between the Macintosh and Windows ClarisImpact 2.0 for Windows has the same file format, user interface, and features as ClarisImpact 2.0 for the Macintosh. You can create a ClarisImpact document on Windows and edit it on a Macintosh computer, or vice versa. Therefore, if you work with both Macintosh and Windows versions of ClarisImpact, or if you collaborate with colleagues who use ClarisImpact 2.0 for Macintosh, you can work without translating files or learning a

different program.

However, if you want to transfer files between platforms via diskette, you must use a file transfer program that lets you create and use PC-formatted diskettes on a Macintosh. To copy the ClarisImpact files onto a PC formatted disk, follow the directions in the documentation for the file transfer program you are using. When you use a multi-platform server (such as Novell Netware) to transfer files from Macintosh to a Windows computer, you can use the ClarisImpact documents right off the server. No file transfer program is required.

When sharing files with systems running Windows 3.1 or Windows for Workgroups 3.11, make sure that your ClarisImpact filenames follow DOS filename conventions (8 characters or less) and end with the .CID extension. (For ClarisImpact Library files, use the .CLB extension.)

Fonts, margins, page breaks, and some graphics might display differently when transferred between Macintosh and Windows. You might have to adjust the margins and page breaks in the transferred file to restore the original appearance.

You can minimize font problems by installing and using the TrueType fonts that ship with ClarisImpact for both Macintosh and Windows. When a file is opened, ClarisImpact first checks to see if each of the fonts in the document is installed in the current system. If a font is not installed, ClarisImpact checks its font mapping information to substitute an appropriate font. Font mapping information is stored in the Claris Font Map file inside the Claris folder in your System folder on Macintosh and in the [ClarisFontMap] section of the CLARIS.INI file in your Windows directory on the PC. If a font is not listed in the font mapping file, it is mapped to Geneva on the Macintosh and to Arial on the PC. You can manually edit and/or add entries to the font mapping information.

I. Network installation issues
ClarisImpact can be installed and run simultaneously by multiple users off of a server. If Windows is also being run off of the server, Windows must be installed using SETUP /N.

Multiple simultaneous users can share ClarisImpact styles. However, if simultaneous users edit the same style, only changes from the last save are retained. For this reason, Claris recommends that users who access ClarisImpact from a server and who want to customize styles should store their CISTYLES directory on their own hard disks.

Multiple users cannot simultaneously open the same ClarisImpact document or library.

J. Software requirements for the DataDraw templates
If you want to use the database or spreadsheet templates that are installed in the DataDraw directory, you must have FileMaker¨ Pro or Microsoft Excel 5.0 installed on your system. Instructions for using each template are located on the Help screens in the FileMaker Pro and Excel template files.

II. GREAT FEATURES OF CLARISIMPACT 2.0

A. Cross-platform support
ClarisImpact 2.0 is now available for Windows and Windows 95 as well as the Macintosh and the Power Macintosh. You can easily exchange files between platforms, because no file-format translation is needed.

B. Automated data transfer with DataDraw(TM)

You can automatically convert information from FileMaker Pro, Microsoft Excel, or any application that exports data to a text file into a number of supported ClarisImpact business graphics. DataDraw turns names, dates, and numbers into organization charts, timelines, tables, data charts, or calendars. Try it out with the templates provided in the DataDraw directory.

C. Enhanced styles
ClarisImpact styles have been professionally designed to reflect today's business standards. These pre-designed combinations of fonts and color schemes help you quickly communicate your data in an attractive graphic format.

D. Powerful presentation builder
Organize your thoughts before they appear on your slides with the integrated ClarisImpact outliner. Use the slide sorter to view and rearrange your entire presentation at a glance. Include speaker notes that help you give your presentation. Add pizzazz to on-screen presentations with over fifty slide transitions and slide markup.

E. More flowchart symbols
Create a wider variety of flowchart diagrams using nine symbol sets. Symbol sets include: Telecommunication and Transportation networks, Decision Trees, Brainstorming, Root Cause Analysis, Total Quality Management, and Block Diagrams.

F. Symbol creation controls on flowchart connectors The flowchart tool includes an indicator showing connector text placement and autogrow/autoshrink symbols. Create flowcharts quickly and easily with these connectors.

G. Flexible organization charts
Make complex organization charts fit where you need them. Quickly resize an entire organization chart by clicking and dragging while boxes in the chart automatically grow and shrink around text. The new Fit To Page feature prints an organization chart of any size on one page.

H. Versatile scheduling timelines
ClarisImpact timelines work well for planning simple projects and tracking milestones. Grid lines automatically adjust to match your project dates, tasks can be linked to and unlinked from each another, and any task can be designated as a milestone.

I. Easy to use table feature
Create complex tables easily. In addition to organizing text and numbers, tables work like spreadsheets by supporting industry-standard formulas and summations.

J. Many data chart types
ClarisImpact includes 32 data chart types and a simple interface for creating them. Charts can be edited and styled in a variety of ways.

K. Enhanced calendars
Produce business or personal calendars that display week numbers as well as weekday-only calendars. Calendar art makes it easy to highlight holidays and other common events.

L. Create great looking graphics
Get creative with a broader palette of colors and gradients. Get your work done faster using the object Info palette and zooming controls. The ClarisArt libraries contain over 400 new clip art images to increase the variety of high-quality art you can use in your charts and diagrams.

Claris¨ and the ClarisImpact team thank you for your purchase of ClarisImpact 2.0. Your support, comments and suggestions help us to continue to bring you better solutions for your future productivity needs.

Published Date: Feb 18, 2012

ClarisDraw 1.0v3 Updater Information

This file is contains a full description of the updater, what it does and where the updated files are located.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
ClarisDraw 1.0v3 Updater

Improvements
* Saving a file to a volume with 2 Gigabytes
or more space available works correctly

Overview
Thank you for investing in Claris software. From time to time, we produce maintenance releases of our software. We'll add minor functionality, correct defects, or respond to customer requests. We'd like to make it as convenient as possible for you to obtain these new versions and enjoy their benefits.

Updates, in contrast to upgrades, contain few changes from the previous version. Instead of distributing the full, revised application, we can provide just the files necessary to incorporate the new functionality and fixes. When you run the accompanying Updater, it will combine your original ClarisDraw 1.0v1 or 1.0v2 files with the new changes to create new ClarisDraw 1.0v3 files. The following files are updated with this updater:

DRAW.EXE - ClarisDraw 1.0v3 application
DRAW.RSR - Resources for the ClarisDraw application (v1 only)
CLDRAW.HLP - ClarisDraw help file (v1 only)

README.TXT - Document that describes general release information. (v1 only)
CODEFLAG.CLB - ClarisDraw art library (v1 only)
MAPS4.CLB - ClarisDraw art library (v1 only)
MAPSYMBL.CLB - ClarisDraw art library (v1 only)
GFXICGM.G32 - CGM import file filter (v1 only)
GFXOCGM.G32 - CGM export file filter (v1 only)
RTF.G32 - Rich Text Format file filter
XTDIMDP.G32 - MacDraw Pro import file filter
XTNDGR95.DLL - File filter support DLL

This document describes the steps you take to apply the update. You may want to print it out if this is the first update you've installed.

ClarisDraw 1.0v3 Updater will upgrade U.S. versions 1.0v1 or 1.0v2 to the current U.S. release, 1.0v3. This Updater WILL NOT update any international versions of ClarisDraw.

The information is organized as follows:
1. Guide to updating your ClarisDraw 1.0 files
2. Legal considerations

1. Guide to updating your ClarisDraw 1.0 files

To use the ClarisDraw 1.0v3 Updater your current installation of ClarisDraw 1.0 must be on drive C:. If your DRAW and CLARIS directories are on different volumes, then you will need to move them to drive C:, run the updater, and then move the updated directory to the desired location.

If the update fails during the procedure, it is because an item

was not found where expected. You must perform a full install of ClarisDraw 1.0v1 or 1.0v2, then run the updater again.

1.1 Applying the update

Quit ClarisDraw, if you're using it.

Run the Windows program DRAWUPV3.EXE included in this distribution. The updater will search for your current ClarisDraw 1.0 folder and bring up a dialog for you to select DRAW.EXE. If you have multiple copies of ClarisDraw, navigate to the correct one. Select the file and click OK. The updater will ask you to confirm the location. Click Yes if it's correct or Cancel to start over again if it's wrong.

The updater will then search for your current Claris folder and bring up

a dialog for you to confirm its location. If you have multiple copies of the folder, selecting 'No' in the confirmation dialog will cause the updater to search again for another instance of the folder - continue selecting 'No' until the one you want to update is shown.

1.2 Technical Considerations

Hard Disk Space
You'll need approximately 3.5MB of free disk space.

Virus Detection Software
The Updater makes several changes to the resources in ClarisDraw. Many virus utilities consider this activity improper and may try to prevent it. To avoid this inconvenience, disable all virus detection software before applying the update.

2. Legal Considerations

Legal Considerations
The enclosed .RTPatch updater program is ©1991-1997 by Pocket Soft, Inc. P.O. Box 821049, Houston, Texas 77282.

The software code changes contained within the Updater, the original software, and the software created by the updater program are © 1987-1997 Claris Corporation. All rights reserved. Claris and ClarisDraw are registered trademarks of Claris Corporation. All other trademarks are

property of their respective owners.

The following license agreement applies:

PLEASE READ THIS DOCUMENT CAREFULLY PRIOR TO USING THIS SOFTWARE.

The enclosed computer program is an update (the Update) to ClarisDraw 1.0 (the Software). In order to use and/or copy the Update as authorized by this License, you must have validly licensed at least one copy of the Software. You are required to have a validly licensed copy of the Software for each copy of the Update made hereunder. The Update and the copies authorized herein replace your validly licensed copies of the Software and are not additional copies (i.e., you may not use the Update in addition to the Software the Update is replacing).

The Update is licensed, not sold, to you by Claris Corporation (Claris) for use only under the terms of this License, and Claris reserves any rights not expressly granted to you. You own the disk(s) on which the Update is recorded or fixed, but Claris and its licensers retain ownership of the Update itself.

1. License. This License allows you to (i) make copies of

the Update, only up to the number of validly licensed copies of the Software in your possession and (ii) use each such authorized copy on a single computer at a time. You are required to have a validly licensed copy of the Software for each copy of the Update made hereunder. The Update and the copies authorized herein replace your validly licensed copies of the Software and are not additional copies. To use the Update means that the Update is either loaded in the temporary memory (i.e., RAM) of a computer or installed on the permanent memory of a computer (i.e., hard disk, CD ROM, etc.). You may use at one time as many copies of the Update as you have licenses for. You may install the Update on a common storage device shared by multiple computers, provided that if you have more computers having access to the common storage device than the number of licensed copies of the Update, you must have some software mechanism which locks-out any concurrent users in excess of the number

of licensed copies of the Update (an additional License is not needed for the one copy of the Update stored on the common storage device accessed by multiple computers). If the Update is installed on the permanent memory of a single desktop computer (i.e., not a storage device shared by multiple computers) and that desktop computer is used by one individual for at least 80% of the time the computer is in use, that same individual may also use a copy of the Update on a portable or home computer.

The Update is protected by copyright law. As an express condition of this License, you must reproduce on each copy the Claris copyright notice and any other proprietary legends that were on the original copy supplied by Claris.

You may permanently transfer all your rights under this License to another party by providing to such party all copies of the Update licensed under this License, and the Software the Update replaces, together with a copy of this License and all written materials accompanying the Update, provided that the other party reads and agrees

to accept the terms and conditions of this License.

2. Restrictions. The Update contains trade secrets in its human perceivable form and, to protect them, you may not REVERSE ENGINEER, DECOMPILE, DISASSEMBLE, OR OTHERWISE REDUCE THE UPDATE TO ANY HUMAN PERCEIVABLE FORM. YOU MAY NOT MODIFY, ADAPT, TRANSLATE, RENT, LEASE, LOAN, RESELL FOR PROFIT, OR CREATE DERIVATIVE WORKS BASED UPON THE UPDATE OR ANY PART THEREOF.

3. Termination. This License is effective until terminated. This License will terminate immediately without notice from Claris or judicial resolution if you fail to comply with any provision of this License. Upon such termination you must destroy the Update, all accompanying written materials, and all copies thereof. You may also terminate this License at any time by destroying the Update, all accompanying written materials and all copies thereof.

4. Export Law Assurances. You agree that neither the Update nor any direct product thereof is being or will be shipped, transferred

or reexported, directly or indirectly, into any country prohibited by the United States Export Administration Act and the regulations thereunder or will be used for any purpose prohibited by the Act.

5. Limited Warranty and Disclaimer, Limitation of Remedies and Damages. YOU ACKNOWLEDGE THAT THE UPDATE MAY NOT SATISFY ALL YOUR REQUIREMENTS OR BE FREE FROM DEFECTS. CLARIS WARRANTS THE DISKETTES ON WHICH THE UPDATE IS RECORDED TO BE FREE FROM DEFECTS IN MATERIALS AND WORKMANSHIP UNDER NORMAL USE FOR 90 DAYS FROM PURCHASE, BUT THE UPDATE AND ACCOMPANYING WRITTEN MATERIALS ARE LICENSED "AS IS." ALL IMPLIED WARRANTIES AND CONDITIONS (INCLUDING ANY IMPLIED WARRANTY OF

MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE) ARE DISCLAIMED AS TO THE UPDATE AND ACCOMPANYING WRITTEN MATERIALS AND LIMITED TO 90 DAYS AS TO THE DISKETTES. YOUR EXCLUSIVE REMEDY FOR BREACH OF WARRANTY WILL BE THE REPLACEMENT OF THE DISKETTES OR REFUND OF THE PURCHASE PRICE. IN NO EVENT WILL CLARIS OR ITS DEVELOPERS, DIRECTORS, OFFICERS, EMPLOYEES

OR AFFILIATES BE LIABLE TO YOU FOR ANY CONSEQUENTIAL, INCIDENTAL OR INDIRECT DAMAGES (INCLUDING DAMAGES FOR LOSS OF BUSINESS PROFITS, BUSINESS INTERRUPTION, LOSS OF BUSINESS INFORMATION, AND THE LIKE), WHETHER FORESEEABLE OR UNFORESEEABLE, ARISING OUT OF THE USE OF OR INABILITY TO USE THE UPDATE OR ACCOMPANYING WRITTEN MATERIALS, REGARDLESS OF THE BASIS OF THE CLAIM AND EVEN IF CLARIS OR AN AUTHORIZED CLARIS REPRESENTATIVE HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Claris' liability to you for actual damages for any cause whatsoever, and regardless of the form of the action, will be limited to the greater of $500 or the money paid for the Update that caused the damages.

THE ABOVE LIMITATIONS WILL NOT APPLY IN CASE OF PERSONAL INJURY ONLY WHERE AND TO THE EXTENT THAT APPLICABLE LAW REQUIRES SUCH LIABILITY. BECAUSE SOME JURISDICTIONS DO NOT ALLOW THE EXCLUSION OR LIMITATION OF IMPLIED WARRANTIES OR LIABILITY FOR CONSEQUENTIAL OR INCIDENTAL DAMAGES, THE ABOVE LIMITATIONS MAY NOT APPLY TO YOU.

6. General. This License will be construed under the laws of the State of California, except for that body of law dealing with conflicts of law. If any provision of this License shall be held by a court of competent jurisdiction to be contrary to law, that provision will be enforced to the maximum extent permissible, and the remaining provisions of this License will remain in full force and effect. If the Software or Update is supplied to the United States Government, it is classified as "restricted computer software" as defined in clause 52.227-19 of the FAR. ClarisImpact 2.0 for Windows Read Me file

This is the full text version of the ClarisImpact 2.0 for Windows Read Me file.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

WELCOME TO CLARISIMPACT 2.0!

Thank you for choosing ClarisImpact¨ 2.0. This Read Me file documents some additional tips that may prove helpful when using ClarisImpact 2.0. This document provides information on:

I. Technical notes and tips

II. Great features of ClarisImpact 2.0

I. TECHNICAL NOTES AND TIPS

A. Installation Follow the instructions in the installation guide to install ClarisImpact. You can't copy the files to your hard drive using the DOS copy command, because the files are compressed to fit on fewer disks. The setup program decompresses files during installation.

You must be running SMARTDRV.EXE to install ClarisImpact. Claris recommends using default values for SmartDrive.

ClarisImpact is a 32 bit application. Before installing ClarisImpact on a computer running Windows 3.1 or Windows for Workgroups 3.11, you must install Win32s, which is included in this package. Note: If you are using Windows 95, do not install Win32s. Some virus checking software may interfere with the installer and prevent a complete installation. If you have trouble installing, turn off any virus checking software before starting the ClarisImpact Installer. You can turn virus checking back on after installation is successful.

You cannot start ClarisImpact from a directory whose name contains upper ASCII characters (for example □, ©, £). This is a limitation of Win32.

B. Out-of-memory error messages If you encounter an error message that indicates there is not enough memory to perform an operation, Claris recommends:

- adjusting your Virtual Memory setting (see Performance tips for Windows 3.1 and Windows for Workgroups 3.11 below)
- removing any unnecessary drivers and TSRs from the CONFIG.SYS file to free up more memory in DOS
- closing other applications and ClarisImpact documents that are running in the background

C. Performance tips for Windows 3.1 and Windows for Workgroups 3.11 32-bit applications such as ClarisImpact 2.0 require that Virtual Memory is on. To improve performance on computers with 8 MB of memory or less, Claris recommends setting virtual memory to permanent and using the suggested size for your virtual-memory setting as displayed in the Virtual Memory dialog box. This value is typically twice the size of physical memory, but should be at least 11,700 K or 11.7 MB.

To set virtual memory:

1. In the Program Manager, open the Main Group, double-click the Control Panel icon, and then double-click the 386 Enhanced icon.
2. Click Virtual Memory and then click the Change.
3. Select Permanent from the Type pop-up menu.
4. Click the checkbox next to Use 32-Bit Disk Access. Note: This setting is NOT recommended for laptops running on battery power.
5. Click OK.

If the suggested size of virtual memory is less than twice the physical memory installed on your computer, you might need to increase your free disk space by removing unwanted files or defragmenting your hard disk. Note: DOS 6.0 users can use DEFRAG.EXE.

If you are an experienced Windows user and you have adjusted your virtual memory settings as described but still feel your performance could be improved:

- In DOS, run:
DEFRAG
- In DOS, run:
MEMMAKER

- Change the following settings in the CONFIG.SYS file:
FILES=60
STACKS=9,256
- Add the following line to the CONFIG.SYS file:
BUFFERS=10
- Add the following line to the [WINDOWS] section of the WIN.INI file:
DefaultQueueSize=16
- Add the following lines to the [386enh] section of the SYSTEM.INI file:
DMABuffersize=64
XLatBufferSize=128
MaxBPS=768
- Delete the following lines from the [386enh] section of the SYSTEM.INI file:
EGA80W0A.FON...
EGA40W0A.FON...
CGA80W0A.FON...
CGA40W0A.FON...
- Always use SmartDrive!

D. Printing If you have trouble printing, try installing an updated printer driver, available from your printer manufacturer or Microsoft Corporation. For instructions on installing a driver and configuring your printer, see the the Control Panel documentation in the Microsoft Windows User's Guide. ClarisImpact requires a valid default printer driver, NOT the Generic/Text Only driver. To select or change the default printer:

1. In the Program Manager, open the Main Group, double-click the Control Panel icon, and then double-click the Printers icon.
2. Select a printer from the Installed Printers list and click Set As Default Printer. If no printers appear in the list, see your Microsoft Windows User's Guide for instructions on installing printers.

E. Video cards and drivers If your screen doesn't display objects correctly, you may have a problem with your video driver. Try changing the resolution to 640x480 or 800x600 or try changing the number of colors displayed (for example, 256, 32K, millions of colors).

To verify a video driver problem, change the video driver to Windows standard VGA and run ClarisImpact. If the problem disappears, contact the video card manufacturer for the latest version of the video card driver or use the driver that is included with the Windows installation.

F. ClarisImpact INI file settings If you experience either of the problems listed below, make the suggested changes to the [ClarisImpact] section of the CLARIS.INI file in your Windows directory:

- Problem:
Color/gradient palettes do not draw completely, or show up with black or missing colors/gradients
Suggested setting:
Cache Palettes = 0
- Problem:
Tools are not drawn correctly, or display as black
Suggested setting:
BitmapTools=0

G. Fonts If fonts do not display or scale correctly (for example, they are clipped or overlap), Claris recommends:
- Making certain a valid printer driver is selected as the default and that is it NOT the Generic/Text Only driver
- Enabling TrueType fonts (see below)
- Making certain the standard Windows fonts, such as Arial, are properly installed

To delete or reinstall standard Windows fonts, see the Microsoft Windows User's Guide.

To enable True Type fonts:
- In the Program Manager, open the Main Group, double-click the

Control Panel icon, and then double-click the Fonts icon.
- Click TrueType, and then click Enable TrueType Fonts.

H. Sharing files between the Macintosh and Windows ClarisImpact 2.0 for Windows has the same file format, user interface, and features as ClarisImpact 2.0 for the Macintosh. You can create a ClarisImpact document on Windows and edit it on a Macintosh computer, or vice versa. Therefore, if you work with both Macintosh and Windows versions of ClarisImpact, or if you collaborate with colleagues who use ClarisImpact

2.0 for Macintosh, you can work without translating files or learning a different program.

However, if you want to transfer files between platforms via diskette, you must use a file transfer program that lets you create and use PC-formatted diskettes on a Macintosh. To copy the ClarisImpact files onto a PC formatted disk, follow the directions in the documentation for the file transfer program you are using. When you use a multi-platform server (such as Novell Netware) to transfer files from Macintosh to a Windows computer, you can use the ClarisImpact documents right off the server. No file transfer program is required.

When sharing files with systems running Windows 3.1 or Windows for Workgroups 3.11, make sure that your ClarisImpact filenames follow DOS filename conventions (8 characters or less) and end with the .CID extension. (For ClarisImpact Library files, use the .CLB extension.)

Fonts, margins, page breaks, and some graphics might display differently when transferred between Macintosh and Windows. You might have to adjust the margins and page breaks in the transferred file to restore the original appearance.

You can minimize font problems by installing and using the TrueType fonts that ship with ClarisImpact for both Macintosh and Windows. When a file is opened, ClarisImpact first checks to see if each of the fonts in the document is installed in the current system. If a font is not installed, ClarisImpact checks its font mapping information to substitute an appropriate font. Font mapping information is stored in the Claris Font Map file inside the Claris folder in your System folder on Macintosh and in the [ClarisFontMap] section of the CLARIS.INI file in your Windows directory on the PC. If a font is not listed in the font mapping file, it is mapped to Geneva on the Macintosh and to Arial on the PC. You can manually edit and/or add entries to the font mapping information.

I. Network installation issues ClarisImpact can be installed and run simultaneously by multiple users off of a server. If Windows is also being run off of the server, Windows must be installed using SETUP /N.

Multiple simultaneous users can share ClarisImpact styles. However, if simultaneous users edit the same style, only changes from the last save are retained. For this reason, Claris recommends that users who access ClarisImpact from a server and who want to customize styles should store their CISTYLES directory on their own hard disks.

Multiple users cannot simultaneously open the same ClarisImpact document or library.

J. Software requirements for the DataDraw templates If you want to use the database or spreadsheet templates that are installed in the DataDraw directory, you must have FileMaker¨ Pro or Microsoft Excel 5.0 installed on your system. Instructions for using each template are located on the Help screens in the FileMaker Pro and Excel template files.

II. GREAT FEATURES OF CLARISIMPACT 2.0

A. Cross-platform support ClarisImpact 2.0 is now available for Windows and Windows 95 as well as the Macintosh and the Power Macintosh. You can easily exchange files between platforms, because no file-format translation is needed.

B. Automated data transfer with DataDraw(TM) You can automatically convert information from FileMaker Pro, Microsoft Excel, or any application that exports data to a text file into a number of supported ClarisImpact business graphics. DataDraw turns names, dates, and numbers into organization charts, timelines, tables, data charts, or calendars. Try it out with the templates provided in the DataDraw directory.

C. Enhanced styles ClarisImpact styles have been professionally designed to reflect today's business standards. These pre-designed combinations of fonts and color schemes help you quickly communicate your data in an attractive graphic format.

D. Powerful presentation builder Organize your thoughts before they appear on your slides with the integrated ClarisImpact outliner. Use the slide sorter to view and rearrange your entire presentation at a glance. Include speaker notes that help you give your presentation. Add pizzazz to on-screen presentations with over fifty slide transitions and slide markup.

E. More flowchart symbols Create a wider variety of flowchart diagrams using nine symbol sets. Symbol sets include: Telecommunication and Transportation networks, Decision Trees, Brainstorming, Root Cause Analysis, Total Quality Management, and Block Diagrams.

F. Symbol creation controls on flowchart connectors The flowchart tool includes an indicator showing connector text placement and autogrow/autoshrink symbols. Create flowcharts quickly and easily with these connectors.

G. Flexible organization charts Make complex organization charts fit where you need them. Quickly resize an entire organization chart by clicking and dragging while boxes in the chart automatically grow and shrink around text. The new Fit To Page feature prints an organization chart of any size on one page.

H. Versatile scheduling timelines ClarisImpact timelines work well for planning simple projects and tracking milestones. Grid lines automatically adjust to match your project dates, tasks can be linked to and unlinked from each another, and any task can be designated as a milestone.

I. Easy to use table feature Create complex tables easily. In addition to organizing text and numbers, tables work like spreadsheets by supporting industry-standard formulas and summations.

J. Many data chart types ClarisImpact includes 32 data chart types and a simple interface for creating them. Charts can be edited and styled in a variety of ways.

K. Enhanced calendars Produce business or personal calendars that display week numbers as well as weekday-only calendars. Calendar art makes it easy to highlight holidays and other common events.

L. Create great looking graphics Get creative with a broader palette of colors and gradients. Get your work done faster using the object Info palette and zooming controls. The ClarisArt libraries contain over 400 new clip art images to increase the variety of high-quality art you can use in your charts and diagrams.

Claris¨ and the ClarisImpact team thank you for your purchase of ClarisImpact 2.0. Your support, comments and suggestions help us to continue to bring you better solutions for your future productivity needs.

Installation Problem with ClarisWorks 5.0 for Windows Disks

When using the diskette version to install ClarisWorks 5.0 for Windows, the installer prompts for the incorrect path.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
When installing ClarisWorks 5.0 for Windows from diskettes, after the first disk is done, the setup prompts for an incorrect path for the second disk. The path it asks for will incorrectly look something like c:\\dos_istemp0.dir\\ while the correct path is most likely a:\\ (or possibly b:\\).

To correct the problem, type in the correct path before inserting the second disk and clicking the OK button. From then on the installer will correctly ask for the disks in the path you have specified.

ClarisWorks 5.0 for Windows: Cannot Install With DOS Compatibility Cards

There is a known problem with all DOS compatibility cards (on any computer, with any CD-ROM driver) where the system will not recognize any DOS CD's that are not in ISO-9660 format. This means other disc directory formats (such as High Sierra, Romeo, and Joliet) will not work on any Macintosh or compatible computer with a DOS Compatibility Card.
This article has been archived and is no longer updated by Apple.
The ClarisWorks Office CD is not truly ISO-9660 (because it contains long file names on the PC side of the disc, whereas the ISO standard uses strictly "eight-dot-three" file names) so these discs cannot be used on DOS Compatible systems to install the WINDOWS 95/NT version of ClarisWorks 5.0.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

Note: AppleWorks is the new name for ClarisWorks.

Claris Discontinues the Publication of the TechInfo Journal

The November 1997 publication is the final issue.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Sadly, the November 1997 publication of the Claris TechInfo Journal will be the final to be issued. We at Claris have enjoyed publishing this periodical and have learned a great deal about our products while doing the research necessary to write the articles. We are proud of the fact that since the TechInfo Journal's inception in 1993, its articles have been helping customers get the most out of their Claris software. With the proliferation of excellent information via the Web, users groups, books and periodicals, the demand for the journal has fallen off. Consequently, we are discontinuing the journal after this issue.

For those customers who found the journal useful, we recommend four sources for your consideration:

1. Please visit the Claris Web site for answers to frequently asked questions and to gain access to the extensive software libraries used by our technicians to help find solutions. You will also find trial software updaters, templates, product news, technical articles, referrals for trainers and consultants, links to relevant sites, applicable books, and more. The URL is: www.claris.com

2. For our FileMaker Pro customers please see the new FileMaker Pro Advisor magazine. Bob Cusick, Technical Editor, stated in the first edition, 'It's my job to help you get your work done through timely and accurate articles explaining the technical ins and outs of FileMaker Pro.' This excellent bimonthly periodical is ideally suited to both the Windows and Mac OS FileMaker Pro users. To obtain one complimentary issue of this magazine, mention that you are a Claris TechInfo Journal subscriber when you contact:

FileMaker Pro Advisor
PO Box 469003
Escondido, CA 92046-9737
Toll free: (888) 430-7600
Email: advanced@database-systems.com
Web: www.database-systems.com

3. For our ClarisWorks and ClarisWorks for Kids customers, check out the ClarisWorks Journal, published by the ClarisWorks Users Group (CWUG). CWUG is an international association of more than 15,000 members dedicated to supporting ClarisWorks software. CWUG is offering one free issue of their journal to recipients of the Claris TechInfo Journal. To obtain your free copy, please send a copy of the back page of this TechInfo Journal to CWUG at:

ClarisWorks Users Group
Box 701010
Plymouth, MI 48170
Telephone: (313) 454-1969
Fax: (313) 454-1965
Web: www.cwug.org

4. The complete library of our TechInfo articles, updated quarterly, is available for interested customers on a CD. This easy to use library is based on the very same one used by our technicians to solve customer questions. The annual subscription price is $249 for the TechInfo CD. For information or to download an order form, please contact: Toll free: (800) 325-2747, Web: www.claris.com/support/contact/contact.html

Thank you for your support of Claris products.

Offers not valid in connection with any other discounts or promotions. Prices and availability subject to change without notice. Limit one copy of each magazine per subscriber. Offers good in U.S. and Canada only. Offers expire 2/28/98.

A/UX: Working with Tape Cartridges (3/95)

I am having trouble working with A/UX and tape cartridges. Can you give me some tips?

This article has been archived and is no longer updated by Apple.
If you want to boot A/UX from the cartridge don't forget to make a swap partition on it and set the kernel value SWAPCNT to the size of the partition. Don't make eschatology partitions. They are for backup; and you don't need to backup the backup disk.

A good way of copying files to a syquest disk is to mount it as /syquest and do

find /dir -depth -print | cpio -puldma /syquest

which will create /syquest/dir and copy over /dir and all subdirectories to the cartridge. Next time you do it, leave out the "u" in "-puldma" and only files that have changed since the last copy will be copied. Great. This method will also copy over the files in /dev.

You don't need to partition each cartridge. Just format it, make sure block 0 is blank (use dd to check or to clear it) use pname to recognize slice 31 and you can use it as c?d?s31. It won't work under Mac OS, of course. To be able to boot from a cartridge you will need a small Mac OS partition plus root and swap partitions.

If your formatting software does not let you create A/UX partitions then you will have to do them under A/UX using dp. You can also format the cartridge under A/UX using the diskformat command and size 512. I suggest making a script to use dp so that you can do more than one cartridge quickly. An example might be something like:

```
dp /dev/rdsk/c4d0s31 << EOF
I7
a1 8 86662 SyQuest y 0 86662 0 1 y y
wq
EOF
```

Make sure you always unmount the disk before removing it. Otherwise, you will lose data. The SCSI disk driver should be modified so that the cartridge can only be removed when a umount is done. This is a simple modification.

Remember to do a fsck on the device before you mount it each time. It's easy to forget, because it is not done automatically (unless you put the drive into /etc/fstab). The consequences of using a disk that has not been fsck'ed can be serious, if there are filesystem errors on the disk that fsck could have fixed. (That is, these errors can occur if the Macintosh crashes, or if you forget to unmount the disk before removing it).

ClarisWorks Office Extends the Power of ClarisWorks 5.0

ClarisWorks Office, featuring ClarisWorks 5.0, Claris Home Page Lite, JIAN Business Basics templates, additional ClarisWorks templates and Internet connection software, extends ClarisWorks software's integrated tool approach to productivity software.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

ClarisWorks Office, incorporating ClarisWorks 5.0, Claris Home Page Lite software, and JIAN Business Basics templates, allows users of ClarisWorks productivity software to create and combine a wide variety of documents: word processing, spreadsheet, database, drawing, painting, and HTML pages. There are many new and exciting features as well, including the ability extend the scope of documents and presentations by adding hypertextual links to other areas of a single document, other ClarisWorks documents, or even links to pages on the World Wide Web. As with all Claris products, ClarisWorks Office is designed to allow everyone from the novice to the home business professional to be productive and creative. ClarisWorks Office is available for Windows 95/NT 4.0 and Mac OS.

ClarisWorks 5.0

Although those familiar with previous versions of ClarisWorks software will still feel at home, ClarisWorks 5.0 has a new look and feel that should make it easier to accomplish tasks and make changes within your documents. From the prominent Button Bar to the integration of many Internet-savvy new features, ClarisWorks 5.0 is designed to help you get your job done.

Button Bars

The most obvious change is the expansion of the 'Shortcut Buttons palette' into a comprehensive system of predefined and user-customizable Button Bars to meet your specific needs. Providing shortcuts to almost every aspect of ClarisWorks 5.0, this button bar serves as the command center for managing your documents. You can change the size and font of text, open your Web browser to "surf" the Internet, open your email program, email a friend, or launch a different application all from within the same ClarisWorks 5.0 document.

ClarisWorks 5.0 comes with several ready-made button bars, each geared to help you perform different tasks: a Default bar (for standard document management tasks like opening a new file or italicizing text); an Internet bar for Web connectivity; an assistants bar for accessing ClarisWorks assistants (predefined macros designed to make certain normally complicated tasks, like printing an envelope, easier); and a Document bar to hold any document-specific Shortcuts you create.

Links and the Internet

Perhaps the most exciting feature added to Clarisworks 5.0 is the ability to make your documents interactive. Clarisworks 5.0 software allows you to easily create hypertext links with other areas of a particular document, other ClarisWorks 5.0 documents, or even pages on the World Wide Web. Any word processing, draw or spreadsheet document can now contain links that will launch your Web browser (e.g., Netscape Navigator, Microsoft Internet Explorer, etc.) and connect to a specified Web page. Or, say, allow you to create an interactive Table of Contents or glossary, where a single click will bring the reader to a specific location within your document, or readily move from a spreadsheet cell to an explanatory paragraph, and then back again.

Spreadsheets, too, sprout new features

The look and feel of the program were not the only areas that received attention. The ClarisWorks Spreadsheet environment often praised for its simplicity and ease of use, also received a few tasteful upgrades. One highly requested addition is the ability to name cells and cell ranges, greatly expanding the power of calculation formulae while also making it easier to create and maintain complex spreadsheet solutions.

How is this easier? Well, instead of being forced to refer to a range of cells by their addresses (A1..A20, B7, etc.), you can now apply a name to these addresses and reference this name in your various formulas. A range of cells where you've recorded bank deposits, for example, may be identified and referred to as simply "Deposits." By extension, this also means that the limit of 255 characters per formula may be effectively side-stepped, as address ranges may be condensed to a very short reference tag.

When the name or cell range is selected, this name will appear at the top left corner of the spreadsheet where the cell reference normally appears. Once the cell or cell range has been named, it will show at the bottom of the Define Name pop-up menu. From this same pop-up menu, you can edit or replace the name(s) you have created. Their is also an Auto Name feature which looks at titles you have included on your spreadsheet and assumes you want to use them as the name of your cell or cell range.

Another new feature in the Spreadsheet environment is the addition of a new Paste Function button, allowing easier access to the many functions built into ClarisWorks. Also new is the ability to view functions in the Paste Function window by category as well as by name, making it easier to find the correct Date function, for example, when you are not sure exactly what it is called.) With these and other smaller changes, ClarisWorks spreadsheets have never been easier to use.

Doing it in Style(sheets)

Improvements have also been made to the Stylesheet feature to make it both more powerful and easier to use. For those who have not used the Stylesheet window in ClarisWorks, stylesheets are a means of grouping a variety of formatting parameters into a single instruction, and then giving that instruction a name. For example, if you want to make sure that all headings in a report are in 14pt Helvetica, are bolded, and are underlined, you might create a Stylesheet that contains these characteristics, and give it a name like Report Headings. Choosing Report Headings from the

Stylesheets menu (or from the list in the Default button bar) will cause selected text to take on these predefined characteristics.

In previous versions of ClarisWorks, you could only apply one style to a particular text, object or frame. In ClarisWorks 5.0, you now have the option to apply compound styles, a combination of characteristics from two or more styles. For example, using the Report Headings example above, you could also make selected headings formatted as checkboxes, while still preserving the other Report Headings characteristics.

A database for all seasons
The database environment, too, is the recipient of some key improvements. Chief among these is the addition of a multimedia field type, allowing you to display photos, store (and play) sounds, or incorporate QuickTime movies into your ClarisWorks database documents. Supported image types include ClarisWorks Library Picture format, PICT, JPEG, GIF, QuickTime Movie and Sound files and OLE Objects for Windows. Teachers can now include scanned pictures of their students inside each of their students' records, for example. To alleviate the storage burden that QuickTime movies would place on a database, they are stored by reference, while copies of the other image types are actually stored within the file.

An office full of templates
In order to truly make ClarisWorks Office the all-in-one resource for home and business solutions, Claris is including the JIAN Business Basics templates in Claris Office. The JIAN Business Basics, created by JIAN Software, offer tools which you can use to grow your business. JIAN Business Basics are ready-to-use business contracts, letters, checklists, spreadsheets, forms and other frequently used documents which can be used and printed "as-is" or customized for your business needs. There are over 60 tools available which relate to the topics of Sales & Marketing, Finance & Accounting and Management & Operations such as Press Release Documents, Financial Ratio Analysis or Invoice Template. Each tool was created to work in the ClarisWorks environment.

Other new features
There are many other additions and improvements :

* ClarisWorks 5.0 can now specify a default font in the preferences window. Each time you open a new word processing document, the font you chose will be selected. No need to create a stationery document expressly for this purpose.

* The draw and paint environments of ClarisWorks 5.0 sport a new Fill Texture Palette, from which you can fill drawn objects, such as squares or circles, with rich textures and pictures from the palette instead just basic colors or gradients.

* Equation Editor, included with ClarisWorks 5.0, can create complex mathematical and scientific equations, which can be inserted into your document.. Although it is not a calculator, the Equation Editor makes it possible to represent higher mathematical functions, algebraic expressions, even molecular compositions. Equation Editor is a separate software application by Design Science that is installed on your hard drive when you install ClarisWorks 5.0.

Meet the rest of the Office

Internet Connection Software
If you are not already signed up with a particular Internet service provider (ISP), or if you are interested in changing ISPs, ClarisWorks Office provides several choices to get connected. These services include browser software. NOTE: Although ClarisWorks Office includes Internet connection software, you must still sign up with one of these providers to take advantage of their services. Startup fees, account fees and other fees are not included in the purchase of ClarisWorks Office but are, in fact, the responsibility of the user.

Claris Home Page Lite
With Claris Home Page Lite you can quickly create instant Web pages. This easy WYSIWYG (What You See Is What You Get) application allows you to create Web pages without having to type any HTML code!

JIAN Business Basics (Claris Edition)
JIAN, makers of BizPlan Builder, have created over 60 different business solution templates for use with ClarisWorks 5.0. Everything from worksheets and checklists covering sales and marketing to management and operation contracts are included to help your small business grow.

System Requirements
You must meet the following minimum system requirements to use ClarisWorks Office*:

Windows 95/NT 4.0**:
* Intel 386 PC or higher (486 Processor for NT 4.0)
* 8MB of RAM (16MB for NT 4.0)
* ClarisWorks 5.0 requires 21MB (minimal install) to 48MB (full install) of hard disk space.
* Internet Browser requires 3-5MB of hard disk space, 5-10 MB of RAM, a modem and an account with an Internet Service Provider or a direct connection to the Internet.
* Claris Home Page Lite requires 10MB of hard disk space and 8MB of RAM.

Mac OS*:
* Mac OS compatible computer with a 68020 processor or higher

* 8MB of RAM (8MB PowerPC version requires virtual memory on)
* System 7.0.1 or later
* ClarisWorks 5.0 requires 21MB (minimal install) to 58MB (full install) of hard disk space.
* Internet Browser requires 3-5MB of hard disk space, 5-10 MB of RAM, a modem and an account with an Internet Service Provider or a direct connection to the Internet.
* Claris Home Page Lite requires 10MB of hard disk space, 8MB of RAM and a PowerPC processor

* Additional items required for Internet access include a modem (14400 baud or higher recommended) and account with an Internet service provider (may require payment of a separate fee) OR direct connection to the Internet.

** Both Windows 95/NT 4.0 and Mac OS versions require a CD-ROM drive. Also, additional RAM may be needed to operate applications simultaneously.

ClarisWorks: Row and Column Headers Print Too Dark

In ClarisWorks 5.0, row and column headers print to dark.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Knowledge Base.
This article has been archived and is no longer updated by Apple.

Issue:
When I print my ClarisWorks 5.0 spreadsheet, it prints a dark box where the row and column headers should be, so I can't see the letters and numbers.

Solution:
When printing, in the print dialog box, choose greyscale for the option labeled Image. Color will also work, but Black and White will not.

Explanation:
ClarisWorks 5 uses the new "Apple Platinum Appearance specification," which makes the column and row headings show up as black letters with a grey background. This new appearance will only print as greyscale and color, it will not print as black and white on some printers.

Changing the Color of a Line in a Paint Frame

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you wish to change the color of a line in a paint frame, use the lasso tool to select the line, select the desired color from the paint-can palette, then go to the Paint menu and choose Fill. When you click elsewhere in your document, the deselected line will have the new color.

Directions for Setting Up your PC to Boot either Windows 95 or Windows NT

How to set up your system to boot in either Windows 95 or Windows NT operating systems.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Setting up your PC to boot in Windows 95 and Windows NT is a method to use when you only have one machine available and you need to have both operating systems at your disposal.

Your hard drive(s) must be formatted as a FAT(also called FAT16) partition in order to be able to boot in either operating system. Windows NT cannot be installed on any hard drive that is formatted as a FAT32 partition, nor can it view data on drives with that format. Windows 95 cannot view data on a hard drive formatted as an NTFS partition.

With your hard drive(s) formatted as a FAT partition, here are the steps to follow for the dual boot:

1. Install Windows 95. If you already have Windows 95 installed, you don't need to reinstall it unless you need to reformat your drives because you don't have the proper kind of partition.
2. Put in the Windows NT CD-ROM. It should auto-run and bring up a window with a button to "Install Windows NT". If not, go into the /i386 folder and run winnt.exe.
3. NT will start to install and either prompt you for information or run on its own without prompting you. After it is finished the first phase of installation, it will restart your computer.
4. In the second phase of the installation, NT will display your drives and partitions. It will also ask which partition you want NT installed upon. Select any of the partitions that are FAT (you can even select the one that Windows 95 is on). When prompted for the partition reformatted, be sure to select that you want to keep the existing file system intact. NT will install to /winnt, not to /windows, so it won't overlay Windows 95.
5. The installation process will continue, with numerous reboots. NT will automatically set up a dual-boot menu.

Once completed, upon booting the system you'll see a menu that has three entries similar to this:
Microsoft Windows
Windows NT Workstation Version 4.00
Windows NT Workstation Version 4.00 (VGA Mode)

A countdown timer will start, and automatically boot into the first option in 30 seconds unless a key is pressed. Select the option you want and press enter. "Microsoft Windows" will boot your previously-installed Windows 95. "VGA Mode" for Windows NT is much like Windows 95's "Safe Mode".

To change which option is booted by default, boot into Windows NT, right-click on My Computer and select Properties. One of the tabs is "Startup/Shutdown". From that tab you can select which item is booted by default, and how long the default countdown time is set for.

How To Stop Loading Programs Automatically At Startup In Windows 95.

Here are some possible methods for to stop loading programs automatically at startup in Windows 95.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There are three places where you can try to stop programs loading automatically:

- The Startup folder
- WIN.INI
- Registry

The Startup folder is the most obvious location for a program reference. To check the contents of the start-up folder, right-mouse click on the Start menu, select Open, double-click on Programs and then double-click on Startup. If you see a shortcut to the program(s) you wish to stop loading automatically, delete it.

To edit the WIN.INI file, select Start, Run, type sysedit and click on OK. Inside the System Configuration Editor, locate the WIN.INI window and make it active. This file typically contains a lot of text. Search the WIN.INI file for a "run=" or "load=" line under the [windows] section. The programs referred to in these lines are the ones that load at startup. To stop these programs from loading at startup, just delete the entire line and save the changes.

* The Registry. Select Start, Run, type regedit and click on OK to open the Registry Editor. Navigate your way to HKEY_LOCAL_MACHINE\\SOFTWARE\\Microsoft\\Windows\\CurrentVersion\\RUN. In the right pane, you'll find programs that load when Windows 95 starts. Right-mouse click on the one giving you grief, select Delete, and close the Registry Editor.
(As always, before editing the Registry, back it up. One way is to zip your System.dat and User.dat files and store them on a floppy disk.)

Automatic Power-Down at Shutdown

Automatically Power-down your System at Shutdown.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Newer systems (based on the ATX main logic board standard) can automatically power-down when Windows 95 shuts down. Shortly after showing the "It is now safe to turn off your computer" screen, a software signal is sent that powers off the computer.

Windows NT 4.0 is capable of doing the same thing, but does not do so by default. To enable this feature:

1. Start RegEdit (regedt32.exe)
2. Scroll down to HKEY_LOCAL_MACHINE/Software/Microsoft/Windows NT/CurrentVersion/Winlogon
3. Edit the following item: PowerDownAfterShutdown: REG_SZ:0. Change it to PowerDownAfterShutdown: REG_SZ:1.

Converting FAT Partitions to NTFS

Using the command-line Convert utility to convert FAT partitions to NTFS.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
NTFS: NTFS is the Windows NT file system. Unlike FAT, NTFS does not use an allocation table but stores information about any file directly with the file. Other operating systems, including Windows 95, and many applications, such as ScanDisk, cannot read NTFS partitions. However, NTFS files or folders that are shared on a network can be accessed by other operating systems. Advantages of NTFS over FAT include faster access to files, more efficient information storage (for example, through a smaller cluster size), better data recovery, integrated file compression, larger disk partitions, and better file security. NTFS is preferred for Windows NT Server because of its better security and fault tolerance features. NTFS partitions also remain relatively unfragmented for long periods of time.

If you have existing FAT Partitions, you can use the command-line Convert utility to convert them to NTFS. This process is much less destructive than reformatting the partition because it does not destroy the files on the partition. If you convert the boot partition, the conversion will actually take place when you reboot the system. Remember that you cannot convert the active partition on a RISC-based system, because the boot partition on these must be FAT.

The syntax of the Convert utility is as follows:

convert <drive:> /fs:ntfs

Conversion is a one-way process. If you need to convert an NTFS volume to FAT, you must reformat the partition, or delete and recreate it; however, either process will destroy he contents of the partition. To preserve your data, back it up to another drive first. (If you need to re-create the active partition, you must run Windows NT Setup again.)

IEC 950 Standards: All Current Apple Products Meet and Comply

Does Apple design and test equipment to the IEC 950 standard?

This article has been archived and is no longer updated by Apple.
All our latest products (including the Serial NB Card) are designed to meet and comply with IEC 950. Furthermore, compliance of CPUs will be verified via third-party, safety-agency approvals. IEC 950 is a hybrid of the electrical-shock, test side of IEC 380 and the flammability requirements of UL 478. Incidentally, it is also Apple's Safety Specification. Older products were designed to meet IEC 380, but they also met the requirements of UL 478 and, therefore, meet the latest specification (IEC 950).

NuBus cards are in the Safety Extra Low Voltage (SELV) category and, as such, do not contribute to any electrical shock hazard. The PC board is approved to UL 94-V-0. In addition, it does not contain any other hazardous component, like a lithium cell. Therefore, a Macintosh system configured with a Serial NB Card does not pose any safety hazard, and the system meets all the requirements of IEC 950.

How Windows NT Generates MS-DOS Compatible Filenames

Windows NT generates 8.3 aliases from Long Filenames by using the following algorithm

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Windows NT file system (NTFS) filenames do not have the same limitations that MS-DOS FAT style filenames have. MS-DOS style filenames are limited to eight and three character strings separated by a period. NTFS filenames can be much longer and may contain more types of characters. When Windows NT copies a file from an NTFS partition to a FAT partition, it needs to change the filename for compatibility. The following rules are applied when filenames are converted from NTFS to FAT:

* All disallowed characters (spaces, restricted punctuation, Unicode characters) in the NTFS filename are removed.
* All periods except the last one preceding a character are removed.
* The first three characters following the last period are used for the three-letter extension of the FAT filename.
* All characters that are illegal in FAT but legal in NTFS are replaced with underscore characters ("_").
* The first six characters of the NTFS filename, a tilde character (~), and a single digit are used for the eight letter prefix of the FAT filename.

For the first four files with similar names:
If necessary, truncate the filename to the first six characters in the name and the first three characters in the extension.
Add the suffix ~<number> to the remaining six-character file name.

For Example, Let's say you had a filename called "MYTESTFILE.TXT". This would get truncated to "MYTEST~1.TXT".
If you had several files that were similar in name the results would be as follows"

LFN DOS Name
MYTESTFILE.TXT MYTEST~1.TXT
MYTESTFILE1.TXT MYTEST~2.TXT
MYTESTFILE2.TXT MYTEST~3.TXT
MYTESTFILE3.TXT MYTEST~4.TXT

For successive files:
If necessary, truncate the filename to the first two characters in the name and the first three characters in the extension.
Use a hashing algorithm to generate the next four characters
Append ~1 to the remaining six-character file name
If that fails to generate a unique name, append ~2, and so forth.

LFN DOS Name
MYTESTFILE4.TXT MYDDDA~1.TXT
MYTESTFILE5.TXT MYEDDE~1.TXT

MYTESTFILE6.TXT MYDDDE~1.TXT
MYTESTFILE7.TXT MYEEDA~1.TXT
MYTESTFILE8.TXT MYDDEA~1.TXT

Because the process can generate filenames that are difficult to interpret, it is good practice to keep the unique portion of the filename in the first six characters whenever possible

If this does not result in a unique filename, only the first five characters of the NTFS filename are used, followed by the tilde and two digits.

When filenames are moved from a FAT partition to an NTFS partition, no conversion takes place because NTFS fully supports the FAT file naming convention.

Removing Dual-Boot after Uninstalling Windows NT

Removing Dual-Boot after Uninstalling Windows NT

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If you install Windows NT after Windows 95, by default dual-boot will be set up on your PC.
However, if you then delete the /winnt directory to remove Windows NT, your system will still display a boot menu when started.
To remove that menu, back up your files (just to be safe), then boot from a Windows 95 Startup Disk (see Add/Remove Programs in Control Panel to create one), and execute the following command:

sys c:

After it completes you'll see the message "System Transferred". Remove the diskette and reboot, and your system will boot straight into Windows 95.
Published Date: Feb 18, 2012

Windows NT File System Files

Windows NT File System Files

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Following is a list of Windows NT system files organized by location. Following the filenames are short explanations.

WINNT\\SYSTEM32

FATBOOT.BIN FAT boot sector template
HPFSBOOT.BIN HPFS boot cluster template
DISKCOMP.COM Disk comparison utility
DISKCOPY.COM Disk copy utility
FORMAT.COM Disk format utility
TREE.COM Graphical directory display utility
ACLEDIT.DLL Access control list (ACL) editor
CUFAT.DLL FAT file system conversion
CUHPFS.DLL HPFS file system conversion
FMIFS.DLL Interface between File Manager and installable file system
IFSUTIL.DLL Installable file system utility
IOLOGMSG.DLL I/O log
UFAT.DLL Provides FORMAT and CHKDSK support for FAT file system.
UHPFS.DLL Provides FORMAT and CHKDSK support for HPFS file msystem.
ULIB.DLL Provides support for commands: DISKCOPY, SUBST, DOSKEY, ACLCONV, CHCP, KEYB, CONVERT, MODE, XCOPY, REPLACE, MORE, PRINT, RECOVER, COMP, FC, CHKDSK, FIND, TREE, SORT, DISKCOMP, ATTRIB, FORMAT, etc.
UNTFS.DLL Provides FORMAT and CHKDSK support for NTFS file system.
ACLCONV.EXE ACL conversion utility. Converts OS/2 LAN Manager server access control lists. Uses BACKACC data file.
APPEND.EXE Enables programs to open data files in specified directories as if they were in the current directory.
ATTRIB.EXE Attribute utility.
AUTOCHK.EXE Auto check utility. Run automatically by the system at boot to check disks.
AUTOCONV.EXE Auto file system conversion utility. Run automatically by the system when the user has requested a file system conversion of a volume that cannot be locked at run time or during Windows NT Setup.
BACKUP.EXE Backup utility
BACKUP.HLP Backup help
CHKDSK.EXE Check disk utility
COMP.EXE File compare utility
CONVERT.EXE File system conversion utility. Converts FAT or HPFS volumes to NTFS.
DISKPERF.EXE Starts or stops disk performance counters for use by Performance Monitor.
FASTOPEN.EXE Dummy file for backward compatibility
FC.EXE File compare utility
FIND.EXE Find string utility
FINDSTR.EXE Searches for strings in files. Can use regular expressions.
LABEL.EXE Disk label utility
NTBACKUP.EXE Tape backup utility
NTIO.SYS Provides IO.SYS support for MS-DOS-based applications.
PERFMON.EXE Performance Monitor
PERFMON.HLP Performance monitor help
PORTUAS.EXE Utility for UAS to SAM database conversion
RECOVER.EXE File recovery utility
REPLACE.EXE Replace file utility
RESTORE.EXE File restore utility
SETACL.EXE Sets ACLs on directory tree during Windows NT Setup.
SHARE.EXE Dummy file for backward compatibility
WINDISK.EXE Disk Administrator
WINDISK.HLP Disk administrator help
WINFILE.EXE File Manager
WINFILE.HLP File Manager help
XCOPY.EXE Extended Copy Utility

WINNT\\SYSTEM32\\CONFIG

```
SYSTEM          Master copy of partition information.
SYSTEM.ALT      Alternate copy of SYSTEM.
```

WINNT\\SYSTEM32\\DRIVERS

```
ATDISK.SYS      IBM AT (ST506) driver used my most ISA PCs
CDFS.SYS        CD file system driver
CDFS_REC.SYS    Mini-file system recognizer for CDFS
DISKPERF.SYS    Disk performance driver
FASTFAT.SYS     Fast FAT file system driver
FAT_REC.SYS     Mini-file system recognizer for FAT
FLOPPY.SYS      Floppy driver
FTDISK.SYS      Fault tolerance disk driver
HPFS_REC.SYS    Mini-file system recognizer for HPFS
NTFS.SYS        Windows NT file system (NTFS) driver
NTFS_REC.SYS    Mini-file system recognizer for NTFS
PINBALL.SYS     HPFS file system driver
SCSICDRM.SYS    SCSI CD-ROM driver
SCSIDISK.SYS    SCSI disk driver
SCSIFLOP.SYS    SCSI floppy driver
SCSIPORT.SYS    SCSI port driver
```

Keypad Graphics from Menu Bar Fail to Display for VT102 Mode

The VT102 Keypad graphics fail to display while in a communications document

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The Keypad graphics, normally displayed as a submenu, fail to display under OS8 in the communications environment. The VT102 tool present (under the Info submenu) is 1.0.2.

Currently we are unsure what is actually causing this problem, but it is being investigated.

A successful workaround is to do the following:
-Under the Connect Menu, select Terminal
-Choose the TTY tool
-Close the dialog box
-Repeat the above process but choose the VT102 tool.

The Keypad graphics will now function properly.

This problem does not affect the operation of the keyboard keypad. It functions properly without the workaround. It has only been tested and verified in ClarisWorks 5.0 under OS8. It has not been tested as yet with other versions of ClarisWorks or System 7.x. This workaround must be implemented each time a communications document is created or opened.

Special Characters in the Charcoal Font

How to get special Characters in the Charcoal font.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Hidden Charcoal Characters

Back in the old days, it was possible to generate such keyboard characters as the Command and Option key symbols only with the Chicago font. Thankfully, these symbols - and more - are available in OS 8's Charcoal font as well. Using the Charcoal font type the following key combinations to get these obscure characters:

Control-q = Command symbol
Control-g = Option symbol
Control-w = Backward Delete symbol
Control-j = Forward Delete symbol
Control-d = Shift symbol
Control-y = Up Arrow symbol
Control-p = Down Arrow symbol
Control-z = Right Arrow symbol
Control-x = Left Arrow symbol
Control-t = Apple symbol

Text Color and ClarisWorks 5.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Changing the text color in a word processing document has changed from ClarisWorks 4.0 to ClarisWorks 5.0. Previously, a Text Color command was available in the Style Menu. Under ClarisWorks 5.0, Text Color is an option that can be accessed from the button bar by changing the button bar setup as follows:

Choose Button Bar Setup
Click on Show Popups and Indicators.

For spreadsheet, database, drawing documents, the Text Color command is available in the Format menu.

Incompatibility Between ClarisWorks 5.0 and Spell Catcher 1.5.8 From Casady & Greene

There is a screen refresh issue with ClarisWorks 5.0 and Spell Catcher 1.5.8 from Casady & Greene when doing spell checking.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
After you have done a spell check in ClarisWorks 5.0 using Spell Catcher from Casady & Greene you will be returned to your ClarisWorks document and the spelling changes will be accomplished if any errors were detected; however, you will notice that your cursor is gone and clicking into the document does not display the cursor.

Solution:
To refresh the screen so that the cursor reappears and you can select words by clicking your mouse you need to switch to the finder or another running application and then back to your ClarisWorks document to get normal control over your document.

Fixes Included in ClarisWorks for Kids 1.0v2 for Macintosh

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks for Kids 1.0v2 corrects the following problems which occurred in the 1.0v1 version of the product:

* Can re-save a file to a HD with >2Gb available;
* Font menu appears correctly under System 8;
* New School Text fonts with international characters corrected

NOTE: There is no on-line updater available for this release. To obtain 1.0v2, customers must be sent a replacement CD.

ClarisWorks 5.0: Custom Outline Style Does Not Allow For Proper Custom Indents

Custom outline styles created in ClarisWorks 5.0 do not properly store custom indents.

Note: AppleWorks is the new name for ClarisWorks.

This article has been archived and is no longer updated by Apple.
This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

Steps to reproduce:

1. Create a new Word Processing document.
2. Show the Styles Palette.
3. Create a new stylesheet.
4. Select Type: outline Based on: None
5. Show all levels in the stylesheet window.
6. Select Level 1.
7. Double-click on the line spacing control in the document ruler and change the left indent to .25. Notice the indent is saved into the new style correctly.
8. Select Level 2.
9. Double click on the line spacing control in the document ruler and set the left indent to .50. Notice the indent is saved into the new style as 1.0.
10. Change the left indent to .75. The indent is saved into the new style as 1.75.

This behavior is not exhibited in ClarisWorks 4.0 or earlier.

The ClarisWorks 5.0v2 Update corrects several minor problems with the initial release of ClarisWorks 5.0. Outline styles can now be imported correctly when overwriting an existing style. To see the problems and issues addressed in 5.0v2 .see the Tech Info Library article Number 22214 at http://docs.info.apple.com/article.html?artnum=22214

ClarisWorks 5.0: Text Field Import Limited to 255 Characters (DB)

When importing into a ClarisWorks or AppleWorks 5.0 database from a text file, the maximum number of characters that can be imported into a text field is 255.

This article has been archived and is no longer updated by Apple.
If you try to import a field with more characters, you'll see an alert and any text after the 255th character is not imported.

Even though the maximum number of characters in a text field is about 1000, the maximum number that can be imported is 255.

Note: AppleWorks is the new name for ClarisWorks.

ClarisWorks Office: Windows CD Installation Issue

ClarisWorks Office Windows CD installation issue : complete contents are not visible, autorun doesn't work, or the installer quits with a "language not found" error, is definitely a driver compatibility issue.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
We have verified a driver compatibility issue with TEAC CD-Roms with some or all of the following symptoms:

1) Neither the CD-Rom nor the CD-Rom controller are listed under Device Manager in the System Control Panel.
2) The complete contents of the Claris Works Office CD are not visible.
3) Autorun does not work, even with Auto-insert Notification checked (in the properties for the CD-Rom drive).
4) Installer quits with a "language not found" error.

Solution seems to be to update the drivers for the CD-Rom drive. Drivers for desktop CD-Roms can be obtained via the web at http://www.teac.com/dsp/cd/dkcdrom.html. You will need to know the model of your TEAC CD-Rom.

This may or may not happen with other CD-Rom drives, but TEAC is by far the most prevalent.

ClarisWorks 5.0: Database Does Not Scroll To Found Record in List View

In List view in a ClarisWorks 5.0 database, when you use the Find command (command-F or Control-F), the database window may not jump to the found record, under conditions stated below:

This article has been archived and is no longer updated by Apple.

- A text field contains more text than can be displayed on screen.
- You use the Find command and the found text is in the long text field (it doesn't matter if the found text is in the displayed text or not).

When this happens, if the record with the found text is not on screen, the window will not scroll or jump to display the found record.

You need to manually scroll the window to view the found record. ClarisWorks 4 did not have this problem, it would scroll to display the record with the found text.

The above information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

ClarisWorks 5.0v2 Update corrects several minor problems with the initial release of ClarisWorks 5.0. To see the problems and issues addressed in 5.0v2 . read the Tech Info Library article Number 22214 at http://docs.info.apple.com/article.html?artnum=22214

Note: AppleWorks is the new name for ClarisWorks.

Contact List Prints in Incorrect Order

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When you choose to print as a Contact List in the Print window, your contacts will print in an incorrect order if the "Which Contacts" popup is set to "All XX Contacts", where XX is the number of contacts.

The workaround is to click on the "Which Contacts" popup and select "XX Contacts in List."

DOS 3.3: CHAIN

Your DOS master diskette contains a utility called CHAIN. Though described on page 106 of The DOS Manual, there are a few additional things to look out for.
This article has been archived and is no longer updated by Apple.
CHAIN does an effective PR#0 and IN#0 when it is used, disabling an 80 column card or a High-Res character generator in the process. The first program can save four memory locations that, when the second program restores them, leave the input and output vectors unchanged.

```
63000 rem prepare to chain
63010 J = peek (999) + peek (1000) * 256 - 110
63020 for K = 0 TO 3
63030 A(K) = peek (J+K)
63040 next K
63050 rem chain now
```

```
10 rem Program 2 #2
20 for K = 0 TO 3
30 poke J+K,A(K)
40 next K
50 rem rest of the program
```

CHAIN overlays your existing Applesoft program with the new program. Watch out for your programs that use DEF FN and Onerr Goto statements. These statements must be re-executed in the new program if they are to work properly, because both statements contain pointers into the program text, which is different for each program.

SMB File Transfer: Troubleshooting Macintosh IIfx Problems

I am having problems with a Macintosh IIfx and SMB File Transfer. I used the 6.0.5 Network Installer disk, and everything seemed to go well. The TokenTalk NB Card is working fine; I can see the zones and devices in the Chooser. Apple File Exchange starts up OK. However, when I try to access the "SMB Servers" choice from the Apple menu, the whole system hangs. I tried using the later versions (1.1.1) of the A/ROSE and TokenTalk Prep files from the MacDFT Golden disk, but I had the same results. Can you help?

This article has been archived and is no longer updated by Apple.
We tested the SMB File Transfer Utility with our Macintosh IIfx, and it worked fine. We did not have to use A/ROSE and TokenTalk Prep from the MacDFT Golden disk. We used the version 1.0 SMB software disk, which installs A/ROSE 1.1, PCSession Prep 1.1, SMB 1.0, and TokenTalk Prep 1.1 in the System Folder.

Here are some troubleshooting suggestions:

Check cable connections. Verify that the SMB server is up. Make sure you are using Apple File Exchange 1.1.2. (Earlier versions of AFE will not work.)

- Ensure that you are using version 2.12 ROM on the TokenTalk NB card.

- Remove any INITs in the System Folder that might cause a problem.

If you are still having problems, please send us more information, specifically:

- Hardware and software configurations and versions, including any network hardware and software.

- Other applications on that system, including INITs, CDEVs, and so on.

Macintosh SE/30,IIfx: Processor-Direct Slot (PDS) Pinouts

Article Change History

04/02/93 - REVISED
* To incorporate SE/30 more fully into the article (and the title).
* Corrected some pinout errors.

I am developing an accelerator board for the Macintosh IIfx and SE/30 and I need pinouts and any other relevant information for the processor-direct slot. Can you help?

This article has been archived and is no longer updated by Apple.
The processor-direct slot (PDS) in the Macintosh IIfx is similar to the PDS in the Macintosh SE/30. It has the same Euro-Din 120 connector as the Macintosh SE/30 PDS and Macintosh IIci cache connector.

Cards in the PDS are accessed at 20MHz. This speed should let developers create PDS cards without using expensive components while still providing access to the processor bus. There are two locations in the memory map for PDS cards. Developers should see the "Cards and Drivers Manual" for information on creating PDS cards. This manual is available from APDA.

The cache connector in the Macintosh IIci may look like the Macintosh IIfx PDS connector, but the pinouts are vastly different.

Note: If a Macintosh IIci cache card is placed in the Macintosh IIfx PDS, it will damage the logic board.

Here is the Pinout for the 68030 Direct Slot used in the Macintosh IIfx and SE/30. SE/30 Descriptions, where they are different, come first, followed by the IIfx description.

AppleTalk Phase 2: Short-Form Versus Extended-Form DDP Headers

Kinetics K-STAR 8.0 supports AppleTalk Phase 2. Under AppleTalk Phase 2, most of the AppleTalk data-link layer changed. Multicast addressing was added, and RTMP was changed quite a bit. Also, the network layer was changed. The short-form DDP header was outlawed. The short-form DDP header is useful only for sending packets within a network, not between networks.

When Kinetics heavily modified K-STAR to support AppleTalk Phase 2, they failed to change the DDP packets their RTMP and ZIP packets were encapsulated in. So, even under K-STAR 8.0, FastPaths send their RTMP and ZIP packets in the short-form DDP header on AppleTalk Phase 1 (non-extended) networks. This seems to work under most circumstances. However, if you run an Apple Internet Router, it expects to see the extended-form DDP headers even on AppleTalk Phase 1 networks. Therefore, even if you use the AppleTalk Phase 2 Upgrade Utility, you still get "Router Version Mismatch" errors.

Why didn't Kinetics switch all their DDP headers to the extended form, which is valid on all networks and always has been? Why would we ever send anything in a short-form header? Why do we even support sending short-form headers since extended-form headers can do everything the short-form ones can?

This article has been archived and is no longer updated by Apple.
In AppleTalk Phase 2, the short-form DDP header is not "outlawed". The short-form DDP header is, and will continue to be, a valid DDP header format.

The extended-form DDP header must be used on all AppleTalk Phase 2 extended networks. Examples of AppleTalk Phase 2 extended networks include EtherTalk 2.x and TokenTalk 2.0.

The short-form DDP header can be used only on non-extended networks, like LocalTalk or EtherTalk 1.x. On a non-extended network, the short-form DDP header can be used for packets whose source and destination nodes have the same network number. The Link Access Protocol (LAP) header for LocalTalk and EtherTalk 1.0 packets contain the source and destination node IDs. Because of this, the source and destination network numbers and node IDs in the extended-form DDP packet are redundant when the packets source and destination nodes have the same network number.

Short-form DDP headers are used solely for efficiency reasons. In fact, an implementation of DDP is permitted to send extended-header DDP packets even when the source and destination nodes are on the same AppleTalk Phase 1 or non-extended AppleTalk Phase 2 network. For example, the AppleTalk Internet Router uses extended-form DDP headers exclusively, even on non-extended networks, like EtherTalk 1.x.

TA43791_MacintoshtoSytek_Broadband_Connectivity_(TIL05748).pdf

Macintosh-to-Sytek Broadband Connectivity

We use a Sytek broadband network with Novell Netware as a standard. Is there any product that lets the Macintosh participate in such a network?

This article has been archived and is no longer updated by Apple.
You should look into a router that routes from LocalTalk or baseband (EtherTalk) to broadband. One such router is the MultiGate 2000 from Network Resources Corporation, which has the ability to connect AppleTalk networks to EtherTalk, broadband, or fiber-optic networks.

The MultiGate 2000 supports Novell, among other network environments, and would give you the flexibility to use LocalTalk or the EtherTalk NB Card, or such Ethernet interface products for compact Macintoshes (and so on, Macintosh SE/30) as the Kinetics EtherPort SE/30. For more information, refer to the Technical Info Library article called "NRC Series 2000 AppleTalk Routers: Description" or contact: Network Resources Corporation.

Other possible solutions are described in the Technical Info library article "Macintosh-To-Novell Netware With AppleTalk" or can be located by searching on "broadband" in the Technical Info library or in either of the buyer's guides on AppleLink. For contact information, search the Technical Info library under "Technical Info library."

TA43792_X_Solutions_for_the_Macintosh_(TIL05749).pdf

X.400 Solutions for the Macintosh

Article Change History

1/19/93 - UPDATED
* Touch Communications, Inc. now SAIC.
6/8/1990 - REVIEWED
* For accuracy.

My company has a growing number of customers in Europe, and we need to communicate (E-mail) with them via the Macintosh. Our corporate backbone already has an X.400 gateway, but we need a front-end, much like AppleLink, to facilitate national and international communication. Is there such an application?

This article has been archived and is no longer updated by Apple.
Apple used RetixMail for a Macintosh demonstration in Hanover.

Apple Europe demonstrated the WOPODA developer tool at the last Hanover fair. It is based on the ODA (Office Document Architecture) standard and lets you do conversions from any word processor to ODIF (Office Document Interchange Format), a standardized format for documents. We needed an X.400 product to send the ODIF documents to the other vendors (including DEC, IBM, Sun, HP, and so on) and used RetixMail for the Macintosh. Here is some information about Apple's forthcoming solution:

The Apple X.400 product is an X.400-compliant MTA (Message Transfer Agent) that runs on any modular Macintosh under System 7. It includes the seven layers of the OSI model. It works either over X.25 (on top of the MacX25 product) or over 802.3 (this is the most used link in the U.S.). It lets Macintosh users gain access to public X.400 networks or to connect to their private X.400 backbone.

Note that APDA is the distributor for the Apple X.400 product to give developers the opportunity to write client software for it.

There are two existing X.400 solutions for the Macintosh, to our knowledge, from Retix and SAIC (formerly Touch Communications). They are similar in their design: the MTA (Message Transfer Agent = the X.400 server) runs on a PC and the UAs (User Agents = the clients) run on a Macintosh. So, you need one PC, at least, to access the X.400 backbone.

- Retix did a PC-based MTA and created two versions of their own client: RetixMail for the PC and RetixMail for the Macintosh. You have to buy both client and server software to use it.

- Touch took another approach: they did an X.400 gateway for Microsoft Mail and one for QuickMail. Macintosh users who use Microsoft Mail or QuickMail today can keep their existing client software. They just have to buy a PC with Touch X.400 software plus either the Microsoft Mail gateway or the QuickMail gateway to connect to the X.400 backbone.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

DOS 3.3: RENUMBER and the MAXFILES command

Applesoft RENUMBER doesn't work with MAXFILES other than 3.
This article has been archived and is no longer updated by Apple.
RENUMBER is a machine language program loaded as an Applesoft program, when run, relocates the machine language up to HIMEM in your system. DOS defaults to MAXFILES 3, so HIMEM is on page boundary $9600, in a 48K Apple. Changing MAXFILES moves HIMEM off this page boundary.

RENUMBER's relocator still does the move, but it doesn't relocate the address properly. The usual result is that the system drops into the monitor in the address range of $0200 - $0300.

A/UX: Trivial File Transfer Protocol (TFTP) Supported

Do any versions of A/UX supports TFTP host and client?

This article has been archived and is no longer updated by Apple.

The TFTP (Trivial File Transfer Protocol) is part of the standard Internet protocols. A/UX B-Net (Berkeley Network) supports most Internet protocols like TCP, IP, FTP, TFTP, SMTP, ICMP, UDP, and so on.

Yes, the TFTP client and server model have been supported since the first release of A/UX (1.0). /usr/bin/tftp and /usr/etc/in.tftpd in A/UX are the TFTP client and server, respectively.

Macintosh Display Cards: RGB-to-NTSC Converters

Do you know of a device that can convert the color RGB signal (interlaced) from the new video cards to NTSC? Does it have the correct grounding for the sense pins to put the Display Card 8/24 into interlace mode and let the convolution (in 8-bit color) work?

This article has been archived and is no longer updated by Apple.
RasterOps has announced an RGB-to-NTSC converter device. It is mentioned in the RasterOps ad in the June 1990 Macworld (pages 114-115). We have also received a marketing flyer on this converter. The name of the product is the RasterOps Video Expander.

The sense pin issue is normally handled in the cable configuration. This eliminates any concern over the converter having to deal with the card configuration. Engineering has tested an early version of the converter with the new cards. It appears that the shipping converter will work with the Macintosh Display Cards. We have not yet had one to test. However, the Display Card marketing group assures us that everything will be fine.

Another RGB-to-NTSC converter is from Computer Video. Their product, Video NTSC Encoder, provides another solution for converting the High-Resolution 8-Bit Macintosh Video Cards to an NTSC output signal. We believe this converter box will work with the new cards. It uses the configuration of the cable to tell the new Macintosh Display Cards which mode to use.

For more details, search the Technical Info library under "Computer Video" and "RasterOps."

Published Date: Feb 18, 2012

Mirror Backup Solutions for the Macintosh

I heard that there is a mirror-backup solution for the Macintosh called "Reflections" that is sold by Profyle Computers, Ltd.
This article has been archived and is no longer updated by Apple.
Profyle creates mirror systems, not just the software. They have complete software and hardware systems for doing mirror backups. The drives range from 100MB to 1.2GB. Currently, Profyle has no U.S. distribution. For more details, search the Technical Info library under "Profyle" and "Natural Intelligence."

A similar type of backup utility was recently announced. Natural Intelligence publishes a product called "Shadow", which does automatic backups.

Shadow periodically copies the documents that have changed since they were last backed up. Shadow can back up onto any kind of disk, network server, or Finder-mountable tape drive.

Published Date: Feb 18, 2012

LocalTalk or PhoneNET: Cable Tester

Do you have a recommendation for a LocalTalk circuit tester?

This article has been archived and is no longer updated by Apple.
We found this article in the Redgate Buyer's Guide Library on AppleLink:

"The AT-Tester is a LocalTalk network cable tester that can test both LocalTalk cables (Mini DIN 3) or PhoneNET cables (RJ-11).

"A user can ensure total circuit integrity in Mini DIN 3 cables by plugging the cable into the power unit and plugging the remote end to the test unit. The tester will then show a user what the problem is. The telephone cable is tested the same way, but using the RJ-11 ports mounted beside the Mini DIN 3 port on either side of the unit."

For more details, search the Technical Info library under "AESP, Inc."

ImageWriter II: Text Collides When Printing in Courier 9 and 10

I have a Macintosh SE running System Software 6.0.4. I use several word processing programs, mostly Microsoft Works 2.0. When I print in Courier 9-point, the ImageWriter II runs words together, either by not spacing between words or by printing the first letter of one word over the last letters of the preceding word. In effect, this is a horizontal compression problem.

I was able to duplicate this problem with a different ImageWriter II attached to a Macintosh II. When I ran Microsoft Works, the text was compressed in a number of places. I didn't test other font sizes.

Can you explain what is happening?

This article has been archived and is no longer updated by Apple.
We were able to duplicate the problem when printing in "Best" mode. We tested other fonts in 9-point and found that only Courier showed these problems. Courier 10 is actually worse than Courier 9.

We don't have an explanation and have forwarded print samples and test results to the proper organization.

LaserWriter IINTX & Macintosh IIfx: SIMM Speeds Different (3/94)

Why aren't SIMMs for the Macintosh IIfx and the LaserWriter IINTX interchangeable? What are the differences, and what are the reasons for not interchanging them?

This article has been archived and is no longer updated by Apple.
The pinouts for the Macintosh IIfx and LaserWriter IINTX SIMMs are the same and both have nearly identical SIMM requirements, but the Macintosh IIfx requires SIMMs rated at 80ns or faster, while the LaserWriter IINTX only requires RAM rated at 120ns.

Macintosh IIfx 1MB SIMMs will work in a LaserWriter IINTX, if they fit physically (see Note), but standard LaserWriter IINTX SIMMs will not work in the Macintosh IIfx because the RAM is too slow.

Overall, we recommend that you use Macintosh IIfx SIMMs in Macintosh IIfx systems and LaserWriter IINTX SIMMs in LaserWriter IINTX printers.

NOTE: The LaserWriter II chassis opening limits the height of SIMMs used on the LaserWriter IINTX logic board. We found that some 1MB SIMMs are too tall, and the LaserWriter IINTX logic board will not slide into the chassis when they are inserted.

Macintosh-to-DEC Printer Solutions

I need to interface a DEC LN03R printer to a Macintosh II. Do you have any suggestions?

This article has been archived and is no longer updated by Apple.
We are assuming that you are talking about the Digital ScriptPrinter LN03R.

To connect the ScriptPrinter directly to the serial port of the Macintosh, you need a cable with the correct pinouts to support all signals between the printer and the Macintosh. Second, even though the ScriptPrinter is PostScript-controlled, you need a driver on the Macintosh so you can select from the Chooser. To our knowledge, there is no such driver. One alternative is to print to a disk file from the application, and send the file to the printer using a terminal emulation program. With the correct cable, you can communicate to the printer using a terminal emulation program, like MacTerminal, over the serial port. This is not very convenient.

Another alternative is to use the printer on the network. With Alisa Digital Printer (ADP) support system, an option for AlisaTalk for VAX/VMS, Macintosh users can print to Digital PostScript devices, such as the LN03R ScriptPrinter and the PrintServer 40. To the Macintosh user, the Digital PostScript device looks like an Apple LaserWriter.

ADP makes use of VMS system queueing and printing. Features include forms and paper-type control, optional job-flag and trailer pages for job identification, paper tray selection, and support for the Adobe system typeface pack. One VMS receiver process handles all Macintosh users; a new process for each job is not necessary. The software uses standard Digital Print symbionts and automatically loads the Laser Prep dictionary to the front of each Macintosh job submitted.

Another product called PacerPrint from Pacer Software, Inc., offers similar features. For more information on the Alisa Digital Printer support system or PacerPrint, search the Technical Info library using keywords "Alisa or Pacer".

Finally, PATHWORKS (formerly LanWORKS) for Macintosh, the new Apple-Digital Alliance product announced May 1, 1990, available later this year, will offer this capability. The service is called VAXshare Print Server, and it will support Digital's LPS20, LPS40, ScriptPrinter LN03R, and Apple's LaserWriter, LaserWriter Plus, LaserWriter IINT, and LaserWriter IINTX.

CD Remote: Controls Only the First of Multiple CD-ROM Drives

How will the desk accessory "CD Remote" act if more than one CD-ROM unit is hooked to a Macintosh, and standard CD audio disks are placed in all drives?

This article has been archived and is no longer updated by Apple.
If more than one Apple CD-ROM device is used on a Macintosh computer, the device with the lowest SCSI number is the unit that CD Remote will control. As an example, two CD-ROM devices are on the SCSI bus. One has a SCSI ID of 2 and the other has an SCSI ID of 5. The CD-ROM device with the SCSI ID of 2 will be the unit accessed by CD Remote. There is no way to change this.

A/UX: Domain Names: Plus Sign (+) not Allowed (9/94)

I have a Macintosh IIx running A/UX that is connected to an Internet consisting of Sun and VAX servers with several kinds of workstations. The problem is that I must begin my domain name with the plus sign (+), and A/UX does not recognize the plus sign as part of the name.

Do you know of a fix for this problem?

This article has been archived and is no longer updated by Apple.
Naming conventions for Domain, Host, Net, and Gateway should follow the rules specified in RFC (Request For Comments) 952. Here is part of RFC-952 regarding the naming convention on the Internet:

A "name" (Net, Host, Gateway, or Domain name) is a text string up to 24 characters drawn from the alphabet (A-Z), digits (0-9), minus sign (-), and period(.). Note that periods are only allowed when they serve to delimit components of "domain style names". No blank or space characters are permitted as part of a name. No distinction is made between upper and lower case. The first character must be an alpha character. The last character must not be a minus sign or period.

Apparently, a domain name beginning with the plus sign (+) violates the RFC-952 naming convention. We think that A/UX "BIND" (Berkeley Internet Name Domain) follows the naming convention described in RFC-952; the plus sign (+) is not allowed in the domain name.

We don't think there is a workaround on A/UX, unless the customer name server host follows the RFC-952 naming convention.

Floppy Disk Failure: Possible Causes

Our office has experienced what seems to be a high failure rate with diskettes. In what ways can disks be damaged and what can be done to prevent further problems?

This article has been archived and is no longer updated by Apple.

Disk wear results mostly from time in use. Abnormal disk wear is usually caused by unclean environments or misaligned or dirty mechanisms. Cigarette smoke, hair (human or pet), and dust all contribute to disk failure.

You might want to invest in a head-cleaning device. Check the industry periodicals for reviews and pick the least abrasive one.

Everex Backup Problem

Our file server is a Macintosh SE with 4MB RAM and two external 80MB hard drives running System Software 6.0.2. One hard drive is partitioned into two volumes. When I try to backup one of the volumes on the partitioned drive to an Everex 91/60 using Everex Backup Software, I get System Error 28. (The other volumes back up without any problems.) Can you explain this?

This article has been archived and is no longer updated by Apple.

The EMAC engineer we spoke with indicated that Error 28 typically means too many files have been selected for backup. They suggest either starting up from the EMAC Utility disk for the backup or performing multiple backups with a smaller number of files. For more information, contact their tech support.

TA43809_DOS_and_APPEND_(TIL00577).pdf

DOS 3.1, 3.2 and 3.2.1: APPEND

The APPEND command opens sequential files, then reads through all of the records until it finds the end. The next WRITE command is then appended to the end of the file. Unfortunately, there are some problems with APPEND.

This article has been archived and is no longer updated by Apple.

When the last carriage return written out is the last byte in the last sector of the file, DOS doesn't allocate another sector for the end of file mark. Therefore, the next APPEND never finds the end of the file, and so the file pointer gets left at the beginning of the file. Consequentially, the next WRITE command writes over the first record.

Try a READ after the APPEND command:

A. When the READ returns an "Out of Data" error, do a normal APPEND, assuming that you're using an ONERR GOTO in Applesoft.

B. A successful READ means that APPEND writes over the file. In this case, the only way to add to the end of the file is to copy the entire file into another, then write your information into the new file. Delete the old file and rename the new file with the old file's name.

Side-by-Side Monitors Can Interfere with each Other

I have a customer who bought an Apple RGB monitor and an Apple Two-Page Monochrome monitor to sit side-by-side. The monitors interfere with each other, so badly that I'm ready to send each of them back and buy third-party products. Anyway, what can be done to have both those monitors side-by-side without any screen warping?

This article has been archived and is no longer updated by Apple.
We found the following in the Technical Information Library using "monitor and interference" as a search string:

Apple Two-Page Monochrome Monitor: Images Vibrate

Interference between two monitors placed side-by-side can cause images on the monitors to vibrate. The reason is that, when placed side-by-side, monitors can magnetically interfere with each other, causing the image on one or both monitors to appear to vibrate slightly. This interference problem is most often seen when an RGB color monitor is placed next to a large-screen monochrome monitor. The amount of interference can also vary depending on the user's environment.

Moving the monitors further apart, especially the rear ends, usually reduces the vibration effect.

Technical Reason For Picture Vibrating

The cause of this shimmering effect lies in the vertical refresh rate, the number of times a monitor repaints the screen each second. When this rate differs significantly between monitors, the interference described above can occur. There is often a large difference between RGB and monochrome monitors. Thus, the vibration effect most often occurs with this combination. Because other factors are involved, it is possible for two monitors with the same refresh rate to exhibit this effect, although this is less frequent.

Shielding monitors so as to prevent this type of interference would add a great deal to the cost of each monitor. Further, by shielding a monitor you can prevent the monitor from interfering with other monitors, but other monitors could still interfere with it. Apple is investigating a number of technologies to prevent this interference in the future and plans to incorporate them as they become feasible.

We are sorry that we cannot solve your problem at this time, but you may see an improvement if:

- the orientation of the monitors is reversed

- the monitors are separated by 8-10 inches

- a metallic plane (foil-wrapped cardboard, for example) is placed between the monitors.

AppleShare: How To Change Network CDEV to EtherTalk

When using a Macintosh II family machine equipped with EtherTalk cards and running EtherTalk only, as an AppleShare server, how do I change the Control Panel's Network setting to EtherTalk?

Once AppleShare is up and running, the Network CDEV cannot be changed to EtherTalk because AppleTalk is active. The Chooser won't let me turn off AppleTalk.

If I have the AppleTalk Internet Router running on the machine, it's no problem because the ATIR handles the change.

This article has been archived and is no longer updated by Apple.
Here is a simple way to do this:

1) Start up the Macintosh with a floppy, system disk.

2) Set the startup application for the Macintosh hard disk to be the Finder. This prevents AppleShare from starting automatically the next time the Macintosh is started up.

3) Restart the Macintosh from the hard disk. It should boot to the Finder.

4) Use the Network CDEV to change from Built-in to EtherTalk.

5) Open the Server Folder and select the AppleShare File Server application (click it once). Set it as the startup application using the Special menu's Set Startup option. Be sure you don't select MultiFinder in this step, because the AppleShare File Server software is not MultiFinder-compatible.

6) Restart the Macintosh, and it should boot to the AppleShare File Server software, now using EtherTalk instead of LocalTalk.

Note that with EtherTalk version 1.2 and later, you can switch network connections without going through this process. The CDEV alerts you that network services will be disconnected and unavailable until restarting. A cancel option is available.

TA43816_MacintoshtoDEC_Integration_Issues__(TIL05776).pdf

Macintosh-to-DEC: Integration Issues (1/95)

A new building, with approximately over 400 Macintoshes, is being set up with a full Ethernet-based network. All the workstations will be Macintosh IIci 8/80 systems, with a variety of DEC and Apple file- and data-servers. The cabling system to be used is thin-wire coax, with either thick-wire or fiber risers (ideally FDDI) in the building, leading to two wiring closets on each floor.

From each of the two closets, one strand of star-wired coax will extend to each workstation. Although it may seem strange, this cabling architecture has been decided upon before the network protocol and data distribution method has been finalized. As I understand it, DEC DEMPRs will be used for coax cable distribution, and some form of DEC bridge installed for DECnet traffic isolation, but this is subject to change.

I am unsure what routers/bridges are available for AppleTalk, DECnet, and AppleTalk and DECnet traffic management.

Obviously, the AppleTalk Internet Router is not a major player, as it can only route AppleTalk packets. DECnet packets, and, therefore, AppleTalk packets embedded ("tunneled") within DECnet packets would simply not get through. However, is there something in PATHWORKS for Macintosh that will act as a gateway between AppleTalk and DECnet? If so, how does this work? Layered on top of AppleTalk Internet Router perhaps? What products would you suggest, either from Apple, DEC, or third-party product families, that we should take a look at?

Finally, do you know of any Macintosh-familiar contacts in DEC who we could contact from this end on DEC-specific issues?

This article has been archived and is no longer updated by Apple.
Just so we are together on this, bridges operate at Layer 1 and the Media Access Control (MAC) sublayer of Layer 2 of the seven-layer Open Systems Interconnection model, and they route packets according to the destination address. Bridges, therefore, are protocol-transparent and allow networks to be constructed using multivendor products and multiple protocols.

Routers, on the other hand, operate at the network layer (Layer 3) of the OSI model and use the protocol information contained within the packet to determine how packets should be routed. In the past, routers were limited by their ability to handle only a single protocol. That's no longer the case.

Many of the newer bridges have multiple communications ports and route packets according to protocol, packet type, and packet length. These are often called "routing bridges."

The following routers support both DECnet and AppleTalk:

Cisco Systems's AGS is a self-learning/load-balancing router that connects 802.3 to 802.5 networks. Protocols supported are TCP/IP, OSI, XNS, DDN, X.25, DECnet, AppleTalk, and Novell's Internetwork Packet Exchange (IPX). It supports the Spanning Tree Protocol, source routing, up to 8 local nets and 14 wide-area net interfaces per unit at up to 4M bits/second. It supports RS-232-C, RS-449, and CCITT V.35. Net management supported is Simple Network Management Protocol (SNMP).

Network Equipment Technologies' LANExchange 50 is a self-learning/load- balancing router that connects 802.3 to 802.5 networks. Protocols supported are TCP/IP, DECnet, XNS, X.25, and AppleTalk. It supports the Spanning Tree Protocol, source routing, up to 24 local nets, and 24 wide-area net interfaces per unit at 1200 to 4M bits/second. It supports RS-232-C, RS-449, and CCITT V.35. Net management supported is Simple Network Management Protocol (SNMP).

Wellfleet Communications, Inc.'s Link Node/Concentrator Node is a self-learning/load-balancing router that connects Ethernet Versions 1 and 2; 802.3 to same local net. Protocols supported are TCP/IP, XNS, IPX, OSI, and AppleTalk. It supports the Spanning Tree Protocol, up to 26 local net on Concentrator Node; 8 on Link Node and up to 52 wide-are interface on Concentrator Node; 16 on Link Node. It supports RS-232-C, RS-449, CCITT V.35, T-1 DS1. Network management supported is SNMP and 802.1.

The AppleTalk/DECnet Transport Gateway in PATHWORKS for Macintosh allows users on one network to access services on the other network. It performs transport relay from DECnet NSP to and from AppleTalk Data Stream Protocol (ADSP). An example of use is running MacX on a Macintosh using a VAX DECwindows client. Without the gateway, the Macintosh needs to run DECnet protocol to talk to DECwindows on the VAX. With the gateway, the Macintosh can run AppleTalk and still can use the VAX DECwindows as its client.

With AppleTalk for VMS 3.0, one can use the VAX as a DECnet and AppleTalk router. With DECnet routing and AppleTalk routing turned on, the VAX can be used to route traffic between two AppleTalk networks. Network management is done via a new management utility called ATK$MANAGER.

For any DEC-specific issues, you may try the AppleLink address DIGITAL.SELL, Apple's DEC team.

For more details, search the Technical Info library under "Cisco Systems," "Network Equipment Technologies," and "Network Resources Corp."

Display Card 8/24 GC: Compatible Third-Party Monitors

I ordered a Macintosh IIfx with the Display Card 8/24 GC. I am also considering a Radius or RasterOps monitor. Do our 24-bit video cards support third-party, large, color monitors?

This article has been archived and is no longer updated by Apple.
SuperMac is the only company that we are aware of that makes monitors that work with the Display Card 8/24 GC. SuperMac is selling two new monitors that work with the new Apple video cards. One is the "Color Two-Page Display" and the other is the "Platinum Two-Page Display."

Both these monitors have a display resolution of 1152 x 870 pixels. The Display Card 8/24 GC will support up to 8 bits per pixel on these monitors.

MacX25: List of Supported X.25 Functions

I need the facts for the following MacX25 categories:

- Packet retransmission support
- Closed user group with in- and outgoing access
- In- and outbound calls barred
- In- and outbound calls carred with a c.u.g.
- One way logical channel incoming and outgoing
- Multi-link procedures
- Direct call
- Hunt group
- Flow control parameter negotiation
- Abbreviated address calling

This article has been archived and is no longer updated by Apple.
Much of this information is in the manual. We assume you want to know if
MacX25 "supports" the following X.25 functions:

Packet retransmission support	No
Closed user group with in- and outgoing access	Yes
In- and outbound calls barred	Yes
In- and outbound calls carred with a c.u.g.	Yes
One way logical channel incoming and outgoing	Yes
Multi-link procedures	No (No X.25 "MultiLink Operation")
Direct call	N/A (but does have Call Redirection Notification)
Hunt group	N/A
Flow control parameter negotiation	Yes
Abbreviated address calling	Yes (implimented via configurable address files)

DOS 3.3: Disk Layout

This article discusses the layout of the DOS 3.3 diskette.
This article has been archived and is no longer updated by Apple.
DOS reserves the first three tracks (0,1,2) of every disk for the boot image of itself, while track 17 ($11) is reserved for the directory and VTOC. Tracks 1 and 2 can be freed by modifying the bit map in the VTOC; however, the disk won't be able to boot properly.

Expanded the directory by changing the link bytes in bytes 1 and 2 of the last sector of the directory.

The number of sectors required for a DOS file can be calculated: Sectors = length / 256 + length / 256 / 122

The physical number of sectors required to hold the data is recorded in the first part of the expression. It's 2 bytes higher for a program and 4 bytes higher for a binary file. The second part contains the track/sector information, even when there is no data. Thus, the minimum number of sectors for a file is two.

Random access files, as are all files, are maintained through the track/ sector list at the beginning of the file. DOS:

- Locates the start of the record
- Determines which sector that byte would be in, relative to the start of the file
- Determines with the track/sector list in which sector the record is located
- Calculates the offset into the sector
- Writes data.

DOS allocates enough sectors in the track/sector list to access the required sector; however, DOS dosen't allocate any sectors when there hasn't been any data written to the records of that sector.

Example:
```
10 D$ = chr$(4)
20 print D$;"open test, L500"
30 print D$;"write test, R65"
40 print "hello"
50 print D$;"close test"
```

This program creates;

- 65 records * 500 bytes = 32500 bytes = 126 sectors
- 126 sectors = 2 track/sector list sectors

for a grand total of:

1 sector of data
2 sectors of track/sector list

No data sectors are allocated for records 0 through 64.

Retrospect: Incompatible with "Tape Disk" Init

I got a copy of Dantz Development Corporation's Retrospect backup software to use with my Apple Tape Backup 40 SC drive, but it doesn't seem to work.

This article has been archived and is no longer updated by Apple.
Dantz Development Corporation, the makers of Retrospect (the site licensed archival/backup software) have found an init conflict between Retrospect and the Apple Tape Backup 40 SC drive's "Tape Disk" INIT.

Essentially, "Tape Disk" is an init that lets the user mount any tape inserted into the Apple Tape Backup 40SC drive onto the desktop. However, Retrospect also has an INIT called "Retro.SCSI" that has been optimized for use with the Apple Tape Backup 40 SC unit.

Thus, if "Tape Disk" is present in your System Folder and loads at startup, Retrospect will be unable to recognize the Apple Tape Backup Unit, (even if Retro.SCSI is not present in your System Folder) whether or not it can be seen using a diagnostic SCSI utility, such as the "SCSI probe" CDEV.

To fix this problem, remove the "Tape Disk" init from your System Folder and restart your Macintosh. Retrospect should recognize your Apple Tape Backup 40 SC unit at that point.

Macintosh SE: Video Display Linearity Adjustments

Using a Macintosh SE, I have drawn three circles of equal size on the same horizontal axis. The circles are touching. When I measure the diameter of the circles on the screen, I find that although the right-hand one is OK, the left-hand one is 1/8 of an inch too narrow.

What's the official way of measuring screen linearity? What is the acceptable tolerance? Does Apple set up the CRT magnets or are they set up by the CRT supplier? How do I have them reset?

This article has been archived and is no longer updated by Apple.
Acceptable tolerance for linearity is approximately 10 percent (horizontal and vertical). That is, an object moved from one place to another will grow or shrink by no more than 10 percent. The CRT magnets, installed by the supplier, are extremely difficult to adjust and should not be moved, even by a service representative. There is no way to adjust linearity of the Macintosh SE display. Apple Manufacturing has developed test patterns to measure linearity.

If the user is dissatisfied with the appearance of the display, the analog sweep PRINTED CIRCUIT BOARD should be replaced by an authorized service provider.

Display Card 8■24 GC: Using With Different Monitors

With a Macintosh Display Card 8*24 GC installed for one monitor, and a number of other cards for other monitors (Apple or third party), will all the monitors benefit from the Macintosh Display Card 8*24 GC? Will if accelerate QuickDraw for the other monitors as well.
This article has been archived and is no longer updated by Apple.
When multiple display cards are installed, the Macintosh Display Card 8*24 GC accelerates drawing in frame buffers of the Macintosh Display Card 4*8, Macintosh Display Card 8*24, and other frame buffer cards.

The Macintosh Display Card 4*8 and Macintosh Display Card 8*24 show the most improvement because they support slave NuBus block transfers and many other display cards do not.

Acceleration for frame buffers other than the one resident on the Macintosh Display Card 8*24 GC would not be as dramatic because of the greater amount of NuBus traffic required.

Only one Macintosh Display Card 8*24 GC may be used for graphics acceleration in a system. If two cards are present, one must have its acceleration function disabled.

LaserWriter 2.0 ROM: Parity & Hardware Handshaking Change (2/95)

This article has been archived and is no longer updated by Apple.
The LaserWriter's serial communication capability has been enhanced. The DTR flow control protocol has been introduced as an alternative to the XOn/XOff protocol.

DTR flow control makes use of a control signal, Data Terminal Ready, which is available through the DB-25 connector (but not through the DB-9 connector). Normally the LaserWriter leaves this signal turned on. However, when it needs to stop the flow of characters from the host, it turns DTR off. The host must immediately stop sending characters until the LaserWriter turns DTR back on again. Similarly, another signal, Data Set Ready, (DSR) may be used by the host to control the flow of data sent to it from the LaserWriter.

Failure of the host to conform to the selected flow control protocol may result in unexpected occurrences of 'ioerror', caused by overflow of the LaserWriter's input buffer. Note that only one flow control protocol can be used at a time, and for flow control to work correctly, the LaserWriter and the host must agree on which protocol is in use.

The parity parameter of 'setsccbatch' or 'setsccinteractive' has been changed to an options parameter that encodes both the treatment of the parity bit (as before) and the choice between Xon/Xoff and DTR flow control. The values of the options parameter now have the following meanings:

Xon/Xoff Flow Control

0 Ignore parity: (RCV high order bit ignored, XMIT high order bit is zero).
1 Odd parity: (RCV checked for odd parity, XMIT each character has odd parity)
2 Even parity: like odd but for even parity.
3 No parity: all eight bits are data and no checking is performed.

DTR Flow Control

4 Ignore parity (see 0 above)
5 Odd parity (see 1 above)
6 Even parity (see 2 above)
7 No parity (see 3 above)

The 9 pin connector's signal pin assignments are unchanged from before.
The set of signals on the DB-25 have been slightly expanded as follows:

2 Transmit Data
3 Receive Data
4 Request to Send (RTS) (optional)
6 Data Set Ready (DSR) (optional)
7 Signal Ground
20 Data Terminal Ready (DTR) (optional)

A cable diagram for connecting a LaserWriter to an RS-232 port might look
like this:

. RS-232 Port Pin -- Pin on LaserWriter

. 2 2
. 3 3
. 6 6

The optional signals need to be connected only if the host computer requires them. If DTR flow control is used, the DTR and DSR lines must be connected.

Availability of DTR flow control considerably simplifies use of the LaserWriter from some computer systems, including the IBM PC. To set up the IBM PC for communication with the LaserWriter over serial port 1 using DTR flow control, issue the commands:

MODE COM1:9600,n,8,1,p

MODE LPT1:COM1

To set up the LaserWriter, connect your serial cable from the LaserWriter to the RS-232 port, set the server mode switch on the LaserWriter to the '9600' position and send from the host computer to the LaserWriter the following
PostScript Code:

Caution:

If you choose to use the PostScript code provided in this article, you assume all risks involved in making these changes. PostScript code, if not entered correctly, can place the LaserWriter into a condition requiring service.

```
%=============================================================
% Begin PostScript Code
%
serverdict begin 0 exitserver
statusdict begin
25 9600 4 setsccbatch
end
%
% end PostScript Code
%=============================================================
```

This changes the LaserWriter over to DTR flow control when executing in PostScript batch mode over the 25 pin connector. The LaserWriter will now be communicating with the RS-232 port using DTR (hardware) handshaking. This status is written into EEROM and will be permanent until changed.

To set up the LaserWriter to use DTR flow control during Diablo 630 emulation, send it the same program with 'setsccinteractive' substituted for 'setsccbatch'.

To change back to Xon/Xoff (software) handshaking, send this PostScript code to the printer:

```
%=============================================================
% Begin PostScript Code
%
serverdict begin 0 exitserver
statusdict begin
25 9600 0 setsccbatch
end
%
% end PostScript Code
%=============================================================
```

These programs need to be sent to the LaserWriter with the server mode switch set to '9600' even if setting up Diablo mode communications protocols. Once the handshake mode is changed, the user may then switch to Diablo mode (switch in 'Special') if desired.

5208 Protocol Converter: Macintosh Substitute For Dial3X

I use "Dial3X" to access my IBM AS400 via the IBM 5208 protocol converter.

Dial3X is full 5250 emulation using the 5208 FILEXFR protocol. I'm looking for a Macintosh software solution. Do you know of any software for the Macintosh that is equal to Dial3X?

This article has been archived and is no longer updated by Apple.
The 5208 Protocol Converter provides support for "non-IBM ASCII terminals", meaning that it supports VT100, and probably other terminal types too.

After you find out which terminals are supported, you can choose from a wide range of emulators available for the Macintosh, or merely use a VT100 emulator such as MacTerminal or MicroPhone II. You will also need to verify what kind of file formats are being used, and what file transfer methods are provided by the 5208, but one or more of the commonly used generic types of transfer programs will likely be supported by the 5208 and terminal emulators.

LaserWriter 8500: Actual Versus Specified Line Length

I own a LaserWriter 8500 that I use in my publishing business for outputting single color separations. I require a high-level of printing accuracy for this type of work. On some of my printed output I have observed that the specified output length for lines does not always match the actual output length when printed to the LaserWriter 8500. The actual output length can be up to 1/16" shorter than expected. Is this normal?
This article has been archived and is no longer updated by Apple.
As you require extreme output precision, you may observe that the specified output doesn't match the actual output in the scanning direction. For example, an 8x8 inch square drawn in a graphics application and then printed to the LaserWriter 8500 may have sides whose length varies from the specified 8 inches. The side of the rectangle parallel to the feed direction (vertical) is typically the specified length, yet the side parallel to the scanning direction (horizontal) may be slightly shorter.

The printed output from the LaserWriter 8500 is within specifications and is not a cause for concern for the majority of customers. If you require precision output, Apple has released a modified PPD file which provides a method for fine-tuning the printed output. The PPD provides 8 adjustment settings from which to choose until appropriate output is realized.

The modified PPD file titled LaserWriter 8500 PPD 1.2 can be downloaded from the Apple Software Updates web site at **http://www.apple.com/swupdates**. A Read Me file is included with the update which provides detailed installation and usage instructions.

AppleVision 1710: Repair Program Ended

My AppleVision 1710 display is showing a black screen. The green LED on the front is on but the image is all black. Is there a special repair program to fix this problem?
This article has been archived and is no longer updated by Apple.
There are no special warranty repair programs available for the AppleVision 1710 and 1710AV displays. The last repair program ended December 31, 1998.

The following instructions will help you perform a display reset if the LED is on but no video is displayed:

1. Connect the display to a Power Macintosh computer running the AppleVision software version 1.5.5 or later*.
2. Connect the power, video, and ADB cables to the Power Macintosh.
3. Power on the computer while holding down the Command-Option-A-V key combination until you hear the system beep sound.
4. The system beep indicates that the display has been reset.

If the image does not return, contact an Apple Authorized Service Provider to facilitate the repair of your display for you. To locate a dealer near you call 1-800-538-9696.

*Apple Displays 1.5.5 previously known as AppleVision software includes several changes from AppleVision 1.5.3. and can be downloaded from the Apple Software Updates Web site at http://www.apple.com/swupdates.

PowerBook 3400 & G3: Installing Memory

Can I install additional memory in my PowerBook 3400 computer?
This article has been archived and is no longer updated by Apple.
Installing memory in the PowerBook 3400 and G3 computer is possible if you are familiar with electronic components. If you attempt installation, any damage caused by the installation will not be covered by the Apple Limited Product Warranty.

In order to accomplish the installation you will need a Torx T-8 screwdriver and a soft cloth to protect the display. The RAM card must use TSOP low-profile RAM chips only. A card with high profile chips may damage your computer. Verify with the memory vendor that the card is specifically designed for use with a PowerBook 3400 or G3 computer.

All instructions presume you are facing the PowerBook as if you were typing.

First, disconnect all cables from the unit, close and latch the display, and remove the battery. On the bottom side of the PowerBook are three screws which attach the keyboard, remove all three screws. Turn the computer back over to drop the screws out.

Next, open the display and remove the keyboard. You may have to use a small tool to gently lift the keyboard from the PowerBook. Lift the front edge of the keyboard up above the palmrest and gently pull it towards you approximately 3/8 of an inch to release it from the computer. There are two cables which attach the the keyboard to the logic board, pulling more than 3/8 of an inch can damage the cables.

Place a soft cloth over the display to protect it and lay the keyboard face up on the cloth.

Touch the metal area inside the PowerBook to dissipate any static electricity you may have built up on your body before handling the RAM card.

If you are replacing an existing RAM card, remove it by gently lifting up on the lower right corner of the card and rocking it out. The new card will take its place. Align the new card on the socket and press down firmly until you feel the card seat into the connector. Be sure the card is level and firmly installed into your PowerBook to ensure reliable operation.

To reinstall the keyboard, insert the back edge under the speaker grille and press down on the front edge to seat the keyboard into the PowerBook. Adjust the display so it is at a 90 degree angle to the computer and rest the PowerBook display on a table top. In this orientation the bottom of the PowerBook will be facing you, then replace the three screws securing the keyboard. Gently squeeze the keyboard and PowerBook to ensure a close fit while replacing the screws. Be careful not to overtighten them, stop when they are snug.

Turn the PowerBook back over, reinstall the battery and power it on to ensure the PowerBook is functioning properly. Once booted up, choose About This Computer from the Apple menu and check the total amount of memory installed. It should be 16MB plus the size of the card installed. If it is not or if the PowerBook makes the sound of breaking glass or get a memory error message during bootup, there could be a problem with the RAM card and it should be removed.

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. To visually identify which type of computer you have, close the display and inspect the display case. A Macintosh PowerBook G3 has a small, six-color Apple logo on the display case. A Macintosh PowerBook G3 Series computer has a large Apple logo on the display case that is not six-colored.

Mac OS 8.5: Keyboard Commands Disabled by Simple Finder

After installing Mac OS 8.5, I have noticed that when I am in the Finder, none of the traditional keyboard commands seem to work (Command-W, Command-N, etc.).
This article has been archived and is no longer updated by Apple.
If you enabled the Simple Finder option during or after the install, keyboard commands, among other things, are disabled. This is a feature introduced with Mac OS 8. To undo this option, go to the Finder and select Preferences from the Edit menu. Uncheck the Simple Finder option and close the Preferences window. This will re-enable features disabled by Simple Finder.

The following are disabled when Simple Finder is active:

- get info (including setting up sharing)
- label
- add to favorites
- make alias or show an original
- put away a desktop item
- print from the Finder
- select all items
- get to the clipboard
- make pop-up windows
- clean up, arrange or sort items in a view
- access view options
- erase a disk
- sleep or restart
- Command keys are not displayed in the menus and do not work for those items present. Command keys also do not function for commands that have been removed
- Pop-up windows and context menus are not available
- Folders that are being viewed as pop-up windows return to windows
- Settings in Preferences and View Options remains persistent when switching between short and long menus

Disk First Aid 8.2.1: Restarts iMac When Quit

Disk First Aid version 8.2.1 or later will automatically restart an iMac when you quit the application.
This article has been archived and is no longer updated by Apple.
To repair some hard drives safely, Disk First Aid needs to quit all applications, including the Finder. With Disk First Aid version 8.2, occasionally icons on the Desktop would not reappear until after the computer was restarted.

Disk First Aid version 8.2.1, running on iMac, automatically restarts the computer after quitting. Future versions of Disk First Aid will not require the restart. Currently Disk First Aid version 8.2.1 ships only with iMac, however, similar behavior could be expected on a different computer running this version.

Mac OS 8.5: PowerBook 3400/G3 Modem Extension Required

I am using a non-Apple modem with my PowerBook 3400 so I removed the Apple Modem extension. Now ethernet does not work.
This article has been archived and is no longer updated by Apple.
For ethernet to work properly on either a PowerBook 3400 or a PowerBook G3 (not G3 Series), the PowerBook 3400/G3 Modem extension must be installed. The extension is installed on both of these PowerBooks with Mac OS 8.5, do not remove it, even if other modem software is installed. Removing this extension will result in the loss of the ability to use ethernet connections.

Note: Macintosh PowerBook G3 computers should not be confused with Macintosh PowerBook G3 Series computers. Though the names are similar, there are significant differences. To visually identify which type of computer you have, close the display and inspect the display case. A Macintosh PowerBook G3 has a small, six-color Apple logo on the display case. A Macintosh PowerBook G3 Series computer has a large Apple logo on the display case that is not six-colored.

Mac OS 8.5: Setup Assistant Not Recognizing CSW 4xxx Drivers

Mac OS Setup Assistant, under Mac OS 8.5, does not seem to recognize my Color StyleWriter 4100.
This article has been archived and is no longer updated by Apple.
The Mac OS Setup Assistant does not recognize, and is unable to configure the Color StyleWriter 4000 Series drivers and therefore, the Apple Color StyleWriter 4100 or Color StyleWriter 4500. To configure one of these printers, you will need to do so through the Chooser.

If you use the Mac OS Assistant to configure your computer, after responding to all of Mac OS Setup Assistant questions, quit the assistant and open the Chooser. Then select the Color StyleWriter 4000 Series driver to setup your printer for use on the appropriate serial port.

Mac OS 8.5: Enhanced Auto-Routing Folders Inside System Folder

What are auto-routing folders in the Mac OS, and are there new ones for Mac OS 8.5?

This article has been archived and is no longer updated by Apple.
Auto-routing folders are those folders within the System Folder that appropriately receive items dropped onto the System Folder. This relieves the user of having to know into which sub-folder within the System Folder a new item needs to be placed. To utilize this feature, simply drop any System Folder addition(s) onto the closed System Folder. A dialog will appear indicating which inner folder will actually receive the dropped item(s).

Auto-route folders are sometimes referred to as magic folders, because of the intrinsic ease of their access though the top level System Folder.

The Finder in Mac OS 8.5, now uses the Folder Manager for auto-routing items dropped into the System Folder into folders that have been registered with the Folder Manager for auto-routing.

Some examples of new folders within the System Folder support auto-routing of items are:

- Preference files (with type "pref") - now correctly routed to the Preferences folder
- ColorSync Profiles - routed to the ColorSync Profiles folder
- Theme files - routed to folder Theme Files in the Appearance folder
- Theme Sound files - routed to folder Sound Sets in the Appearance folder
- Picture files (JPEGs) - routed to folder Desktop Pictures in the Appearance folder
- Find file search engines - routed to the Internet Search Sites folder
- Compiled scripts - routed to the Scripts folder (Note: this may not be the appropriate place due to the organization of sub-folders within the Scripts folder.

There are other enhancements to auto-routing that are of more interest to developers installing their products. These are detailed in the Tech Note for Mac OS 8.5.

AppleScript: Trademark Symbol Removed from Folder

Why was the trademark symbol dropped from the AppleScript folder in Apple Extras folder?
This article has been archived and is no longer updated by Apple.
This was done to simplify localization of folder names for international software. Other products, such as QuickTime, have also had the trademark symbol removed from file and folder names.

After installing Mac OS 8.5, there will be two AppleScript folders in the Apple Extras folder, the old folder with the trademark symbol and a new folder without. The old AppleScript folder is left in the Apple Extras folder, in case you have moved other material to this folder. The old Script Editor is deleted from the old AppleScript folder, and the new Script Editor placed in the new AppleScript folder.

If there is nothing in the old AppleScript folder that you wish to save, then you may safely move it to the Trash.

Mac OS 8.5, 8.6, 9.0: Keyboard Shortcuts

What keyboard shortcuts are available in Mac OS 8.5, 8.6, and 9.0?
This article has been archived and is no longer updated by Apple.
Here are the keyboard shortcuts for Mac OS 8.5, 8.6, and 9.0 a plus sign (+) means keys are held down together.

Getting out of freezes
If your computer freezes while you are using it, the following key combinations may help to recover from the freeze.

- - Turns your computer on and off. Your work will be saved before the computer shuts down.

- - Cancels an operation in progress.

- - Forces a program to quit. Unsaved work will be lost.

- - Restarts or shuts down the computer (on some models). Unsaved work will be lost.

- - Forces the computer to restart. Unsaved work will be lost.

Starting up
Holding down the individual key or key combination during startup will provide the described results.

- - Rebuilds the Desktop file.

- - Turns off extensions in the Extensions folder.

- - Closes all open windows in the Finder.

- - Resets Chooser and control panel settings stored in parameter RAM.

- - Starts up the computer from a CD.

- - Bypasses the startup disk when starting up.

Working with icons

Arrow Keys - Selects the icon above, below, to the left, or to the right of the selected icon.

Letter keys - Selects the icon whose name begins with the letters typed.

- - Selects the next icon alphabetically.

- + Click icon - Selects all of the icons clicked.

Drag across icons - Selects all icons in the group.

- + Double-click icon - Opens the icon and closes the window the icon is in.

- + Drag icon to folder - Copies the icon to the folder.

- - Highlights the name of the selected icon.

- + Drag icon(s) - Aligns selected icon(s) to the nearest gridpoint.

- +Drag icon - Creates an alias of the icon.

- - Moves selected icons to the Trash.

Working with windows

- +Click close box - Closes all disk and folder windows.

- +Click collapse box - Collapses all disk and folder windows.

- - Closes the frontmost window, or collapses a pop-up window to its tab state at the bottom of the screen.

- - Closes the frontmost window and converts it from a pop-up window to a normal Finder window.

- - Closes all open windows and converts them from pop-up windows to normal Finder windows.

- +Click zoom box - Enlarges a window to the full size of the screen.

- +Switch programs - Hides the windows of the previous program.

- +Drag window - Moves a window without making it active.

- +Press window's title - Displays a pop-up menu of folders to which the current folder belongs.

- - In a list view, expands the contents of the selected folder(s).

- - In a list view, collapses the contents of the selected folder(s).

- +Expand folder - In a list view, expands the contents of the folder and all folders contained within it.

- +Collapse folder - In a list view, collapses the contents of the folder and all folders contained within it.

Saving files
These shortcuts work in Save dialog boxes. A plus sign (+) means keys are held down together.

- - Selects the item above or below the selected item.

Letter keys - Selects an item in the active list whose name begins with the letters typed.

- - Moves to the next keyboard focus item.

- - Moves to the top of the scrolling list.

- - Moves to the bottom of the scrolling list.

- - Scrolls the list up one screen.

- - Scrolls the list down one screen.

- - Moves up one level in the file hierarchy.

- or - Changes current location to the desktop.

- or - Opens the selected folder or volume.

- or - Selects the original of an alias.

- - Creates a new folder.

- - Clicks the Save button (if it is active).

- or - Clicks the default button (usually Save or Open).

- or - Closes the dialog box.

Additional keyboard shortcuts for the new Save dialog box
The following keyboard shortcuts also work in the new Save dialog box.

- - Displays the next location in a historical sequence (similar to the "Forward" command in Web browsers).

- - Displays the previous location in a historical sequence (similar to the "Back" command in Web browsers).

Opening files
These shortcuts work in Open dialog boxes. A plus sign (+) means keys are held down together.

- - Selects the item above or below the selected item.

Letter keys - Selects an item in the active list whose name begins with the letters typed.

- - Moves to the top of the scrolling list.

- - Moves to the bottom of the scrolling list.

- - Scrolls the list up one screen.

- - Scrolls the list down one screen.

- - Moves up one level in the file hierarchy.

- or - Changes current location to the desktop.

- or - Opens the selected folder or volume.

- or +Open alias - Selects the original of an alias.

- or - Clicks the Open button.

- or - Closes the dialog box.

Keyboard shortcuts for the new Open dialog box
The following keyboard shortcuts also work in the new Open dialog box.

- - Selects all files that can be opened (if the Edit menu is active).

- - Expands the selected folder or volume.

- - Collapses the selected folder or volume.

- - Displays the next location in a historical sequence (similar to the "Forward" command in Web browsers).

- - Displays the previous location in a historical sequence (similar to the "Back" command in Web browsers).

Taking pictures of your screen
To create a picture file of all or parts of your screen, hold down these keys. (The file is saved on your startup disk.) A plus sign (+) means keys are held down together.

- - Creates a picture file of the entire screen.

- - Creates a picture file of a rectangular section of the screen. (After pressing and releasing the key combination, drag across the part of the screen you want to take a picture of.)

- - Creates a picture file of a window. (After pressing and releasing the key combination, click the window you want to take a picture of.)

Note: To copy a section of the screen or a window to the Clipboard instead of saving it as a file, press the Control key as you select the part of the screen or window.

Working with languages
These shortcuts work on computers with WorldScript installed. WorldScript is software that lets you use other languages on your computer, and is installed by Apple language kits.

- - Rotates to the default keyboard layout or input method in the next script.

- - Rotates to the next keyboard layout or input method in the active script.

Note: This shortcut is available, even without WorldScript installed, by selecting this option in the Keyboard control panel.

MacX: Can‘t Start Remote VAX Applications on MultiNet (1/95)

This article discusses why MacX is unable to start up remote applications on VAX systems running MultiNet.

This article has been archived and is no longer updated by Apple.
We have been testing MacX in a DECwindows, VMS/Multinet environment and were never able to get it to work successfully.

We have been working with TGV technical support to find out why MacX is unable to start up remote applications on VAX systems running MultiNet. We were able to get DECwindows applications to display on the MacX server using TCP/IP transport (no DECnet transport, since we don't have that connection tool on my Macintosh), only if we started the application manually on the VAX. We were unable to use the MacX "Remote" menu to start the applications from the Macintosh. The problem was traced to a problem in the rexec server on the VAX.

MultiNet is based on the UC Berkeley implementation of TCP/IP. This is a fairly robust implementation of TCP, since it has been around since about 1982 and has been tuned significantly over the years. However, the Berkeley people added the notion of "privileged ports" to their implementation of TCP.

A TCP port number is a 16-bit integer which identifies individual applications on the same host. In the UCB world, port numbers 1-1023 are considered "privileged," and only the superuser is allowed to access them. The UCB rshell and rlogin protocols use this concept to do remote authentication without sending passwords over the network. The basic idea is that if a request comes in from a privileged port on the remote host, then it must be the superuser making the request, so the server "trusts" the requester. The authentication procedure then proceeds without the use of passwords (I'll not bore you with the details). If the requester is not using a privileged port, then the request is denied (i.e. the server closes the connection). (Aside: if the host on which the requester resides does not have the concept of a privileged port, then it could conceivably allow anyone to open a port in the range 1-1023 and thus spoof the UCB rshell/rlogin servers. This makes the privileged port concept a bad idea.)

MacX does not use the rshell protocol; it uses the rexec protocol instead. Rexec does not use the privileged port authentication scheme, but instead relies on the username and password being sent over the network. The MultiNet rexec server erroneously checks to make sure that the requester is using a privileged port and closes the connection if it is not. This behavior is incorrect. Rexec does not use the privileged port number scheme, so it should not do this check. The rexec server distributed with UCB-based UNIX systems (like Ultrix and SunOS) is implemented properly, so it does not do the check. That is why MacX interoperates well with UNIX, but not with VMS/MultiNet. I do not know if other TCP/IP implementations for VMS have this problem or not. Oh yeah, since A/UX contains the UCB networking code, including the r-utilities, it works fine as well.

Please note that the problem is not in VMS DECwindows, nor is it in the interaction between DECwindows and the TCP/IP transport provided by MultiNet. We know this because we were able to start up DECwindows clients from the VAX and that worked properly. The problem is only with the MultiNet rexec server erroneously checking for a privileged port from the requester, and TGV has indicated to me that the problem will be fixed in MultiNet V2.2. This problem will not affect using MacX with the DECnet connection tool, since DECnet obviously doesn't use the rexec protocol. It will also not have any affect on other implementations of TCP/IP for VMS, unless they have the same problem.

Mac OS 8.5: Register With Apple

What is the purpose of "Register with Apple"? What is a workaround if it does not work?
This article has been archived and is no longer updated by Apple.
Mac OS 8.5 includes an application called Register with Apple, first introduced with the Apple iMac computer.

This is an automated AppleScript which checks to see if the customer has a valid Internet Setup already configured. If not, it launches Apple Internet Assistant. The whole process proceeds until the user either cancels or has a valid Internet dial-up connection configured. Then the software launches the iMac's default browser and attempts to connect to Apple's Online Product Registration site.

Workaround

If you are unable to successfully register using the Register with Apple application, you can also register by:

- Using your web browser to open " http://www.apple.com/register/ "
- Complete the product registration card included with the product you purchased

LaserWriter: "Prepping" a LaserWriter on a Mixed Network

Is it possible to prep an Apple LaserWriter II without a Macintosh on the network?

I have mixed PCs, UNIX, and Macintoshes on LocalTalk network. I turn off the LaserWriters at night but in the morning a Macintosh user may not be the first person that prints. Does AppleShare PC handle this? Is there a TEXT PostScript version of the LaserWriter prep we can download via other types of CPU? Any idea on this

This article has been archived and is no longer updated by Apple.
AppleShare PC does not require that a LaserWriter be "prepped" by a Macintosh, or by sending a prep file from the PC before printing. It is capable of printing to a LaserWriter without any Macintosh assistance.

Some programs do require features that are only available in downloaded dictionaries, but these products typically include their own LaserWriter driver that handles this. If a user writes PostScript code on the PC that requires features provided by Laser Prep, they can extract the substance of Laser Prep from a Macintosh, and then download it from the PC along with their code.

Capturing the Laser Prep code on a Macintosh can be done by separating it from any PostScript file that has been generated, by holding down Command-K at print time. Here is the procedure:

1) Use the Chooser to select a LaserWriter, and turn off Background Printing.

2) Open a word processor and create an empty document.

3) Choose the Print... command in the File menu.

4) Click OK.

5) Immediately hold down the Command and k keys.
- the k key dumps a PostScript image with Laser Prep
- the f key would dump a PostScript file without Laser Prep
Hold the keys down until you see the Print Status dialog box.

The Print Status dialog box will say "Creating PostScript File." When the program is through printing, you will find a text file in the current application's folder called "PostScriptn," where n is a number that increments from 0 for each print job. If this is your first try, the file should be named "PostScript0."

Now that you have the PostScript file, you can extract the Prep section by editing it with your word processor. Cut out the section at the end that represents the empty print job. It should begin after the file's first blank line and look something like this:

T T 0 0 730 552 -31 -30 761 582 100 72 72 1 F F F F T T T F psu
(Bill's Macintosh IIx; document: Untitled)jn
...and so on...

What remains can be transferred to the PC, and downloaded from there to the LaserWriter whenever needed (along with the user's code).

TA43852_Business_BASIC_III_Numerics_(TIL00581).pdf

Business BASIC III: Numerics

This article has been archived and is no longer updated by Apple.
Apple III Business BASIC uses the same floating point math package that Applesoft uses internally. However, Business BASIC only display a maximum of 6 decimal digits when it prints. This limitation was built in because the last three digits of Applesoft's math package develop errors that can seriously affect some applications.

MacTCP: List Of Applications

Is there a list of all commercial and public domain programs that use the Apple MacTCP driver or that allow the Macintosh onto a TCP/IP network (either through a DDP/IP gateway or directly onto Ethernet)?

This article has been archived and is no longer updated by Apple.
The following is a substantial, but by no means complete, list of programs that use MacTCP:

Commercial Products that use MacTCP

MacX from Apple

HyperCard MacTCP Toolkit from Apple (APDA)

TCP/Connect (Telent: VT240,TN3270, TEK 4014, FTP, Mail, News) from InterCon

MacPathWay Access (Telent: VT240, TN3270, FTP, SMTP mail) from Wollongong

NetOne TCP for Macintosh (FTP, Telnet) from Ungermann-Bass

TCPort Host Access (FTP, Telnet) from Novell

Database access from Oracle and Informix (WingZ)

TGRAF (Tektronix 4017) graphics emulator from Grapoint

Mathematica (mathematical modeling) from Wolfram Research

GatorMail SMTP gateway from Cayman Systems

Exodus (X window server) and a VT 220, 240, 241 emulator from White Pine Software

Non-commercial Products that use MacTCP

MacIP, MacMH (FTP, Telnet, Mail) from Stanford University

NCSA Telnet from NCSA, University of IL

3270 emulator from Brown University

BeaverGate SMTP gateway for QuickMail

For more information, search the Technical Information Library under the names of the various vendors.

Mac OS 8.5: Apple System Profiler 2.1.1 Features

What are the features of Apple System Profiler 2.1.1?
This article has been archived and is no longer updated by Apple.
The Apple System Profiler (ASP) is a software application that gathers and displays information about the Macintosh computer on which it is run. This information includes data such as system software version, memory installed, types and number of hard disk volumes attached, and information on installed control panels, extensions, and applications. The goal of Apple System Profiler is to provide all who service and support Power Macintosh systems with an easily understood, consistently available, extensible, scalable and accurate profile of the computer they are working with.

Apple System Profiler version 2.1.1 provides many new features and enhancements over previous versions. Some of the overall goals for version 2.1.1 are to add features that have been requested, to support new Power Macintosh models, and to match the Mac OS 8 appearance "look and feel" more closely.

Features
ASP v2.1.1 adds many changes since the v1.4 release:

- ASP 2.1.1 supports AppleScript scripting and some, but not all, features are recordable with the Apple Script Editor. AppleScript support includes:
- Querying or setting which data options to gather in a system profile report
- Creating a system profile report (document)
- Saving a report to disk
- Printing a report
- Retrieving the text of a report

ASP 2.1.1 uses the Mac OS 8 Finder's "look and feel" to present its Control Panels, Extensions, and Applications file information. Additional information is provided when an item is selected (similar to the Extensions Manager). The Devices and Volumes Information now links volumes with associated drive devices, displaying this information in a graphical format.

ASP 2.1.1 adds significantly more information, such as drive serial numbers and RAM configuration, to further assist end users and support technicians in the troubleshooting process. Compared to earlier ASP versions, ASP 2.1.1 displays the following additional information:

- RAM configuration (location, size, and type)
- Lists of machine names (earlier versions only said "Power Macintosh" if there were multiple versions of the same machine)
- Device information (as applicable):
    - USB
    - SCSI and Internal ATA
    - SCSI and ATA device serial numbers, if available
    - PCI
    - NuBus
    - PC Card and Media Bay
    - Personality card name
    - Network volumes
    - Internal RAM Disk
    - Floppy
- Additional information about cards, such as Ethernet card's hardware Ethernet addresses
- Keyboard type
- Driver version numbers for drives with media
- File sharing status for each volume
- Volume partition and disk sizes (and % full)
- Cache sizes (backside and external)
- Matches drives/devices to volumes
- Desktop printer information
- File creation, modification, file size, memory size, and "balloon help" info
- Looks for file information on multiple volumes of the user's choice
- Web sharing status (on/off--doesn't indicate whether installed or not)
- QuickTime version (does indicate whether installed or not)
- Matches display information with built-in video or display cards
- Open Transport settings:
    - AppleTalk, TCP/IP
    - Whether single-link multihoming (Open Transport 1.3 or later) is active or not
- Drag and Drop information onto the Finder desktop (text-clipping file), and other applications

Additionally, ASP 2.1.1 no longer displays the OpenDoc version or the customer care code.

System Requirements
Minimum Hardware Requirements:

- iMac or PowerPC Macintosh or Macintosh computer with a PowerPC Upgrade Card
- Mac OS 8.5 memory requirements: 16 MB installed RAM, total of 24 MB through Virtual Memory

Minimum Software Requirements

- 4 MB memory free
- Mac OS 7.6 or later
- 1.4 MB free disk space

Recommended Requirements for Maximum information:

- Open Transport installed
- Startup with all extensions on

For additional information on how to use this feature, click the Help button or open the Help Center (from the help menu) and type the name of the feature. Balloon Help can also answer questions about window contents, window controls and menu items in the Finder, Control Panels and Applications, where supported. To turn on Balloon Help, choose "Balloon Help" from the Help menu in the Finder.

Mac OS: Using Text to Speech and Speech Recognition

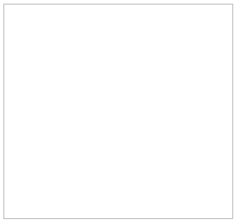
How do I use the Text to Speech and Speech Recognition functionality of the Mac OS? I have Mac OS 8 installed on my PowerPC Macintosh.
This article has been archived and is no longer updated by Apple.

Using Text to Speech

The TTS software running on the your Macintosh allows speech-enabled applications to speak selected text. The way this typically happens is you select some text (or an entire document), then select the application's Speak command. The TTS software in the System Folder then takes over and reads the text aloud. That's it!

Generally speaking, the Speech command will likely be in a menu or tool bar if the application supports TTS. The voice menu or list of available voices will usually be close by.

In SimpleText, use the Sound menu:



Other applications may or may not support speech. If youare not sure if your application support TTS, you should contact the developer of the application.

Mexican Spanish TTS uses the same menus and control panel as English TTS. To change from an English voice to a Mexican Spanish voice, simply select Carlos or Catalina from the list of available voices.

Using English Speech Recognition (SR)

This section explains how English SR works. As we progress through the process, remember SR can only recognize commands that are in the Speakable Items folder (with one exception: the OK/Cancel check box in the Speech control panel allows button names to be understood by SR).

Introduction to Speech

The first time the computer starts up after SR has been installed, the Apple Guide-based Introduction to Speech tutorial automatically opens:

This tutorial walks the SR user through the basics of turning on and configuring SR, how to speak to the computer, how to read the SR indicators, how Speakable Items works, etc. If novice SR customers call you with basic SR problems, it's a good idea to have them run through this tutorial. As a support rep for Apple, make sure you go through it when you work on the PlainTalk hands-on lab (a companion to this self-paced training).

So How Does It All Work, Then?

The Feedback Window

When your SR-enabled computer starts up, in addition to your normal desktop, you'll see a floating SR feedback window:

The face you see above corresponds to the feedback character previously selected (in the Speech control panel). In this example, "Tiki" is the SR name of the computer. "Speakable Items is ready" indicates the SR software and hardware have started up and are waiting for the user to speak a known command.

Speakable Items

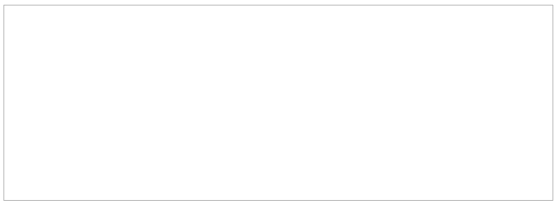
So what counts as a valid command? Any item in the Speakable Items folder. This is a special folder installed by the SR installer in the Apple Menu. Any item in Speakable Items can be used as a command. For example, a user can put an alias of the Indigo beep sound in to the Speakable Items folder, issue the spoken command "Indigo" (or "Open Indigo"), and SR will play that sound, just as if the user had double-clicked that icon.

Simply put, any item in Speakable Items can be opened by speaking its name. That is how SR works.

The Speakable Items folder comes with a set of commands pre-installed. There is a More Speakable Items folder in the Apple Extras: Speech Technology folder. Not surprisingly, it contains additional commands you can drag into your Speakable Items folder.

What Happens When You Speak

When you speak, the PlainTalk microphone picks up your sound input and sends it to the SR hardware and software for recognition processing. How can you tell if your microphone is working and SR is listening? You'll see sound waves like these:



These sound waves to the left of the character indicate that computer can hear you. Sound waves are important indicators when troubleshooting SR. If you do not get any sound waves, you either don't have the mic connected, you don't have the right type of CPU, or the SR software is off or misconfigured.

To tell the computer you are ready to speak to it, speak its name. Look at the feedback character; if its eyes are open and you see sound waves, it is trying to interpret your speech. If its eyes are closed, SR is in standby, and nothing will happen until you wake up SR by using the keystroke set in the Speech control panel, above.

When the computer recognizes its name and is ready for your command, you will see its name ("Tiki" in this example) disappear from the feedback window. Whatever you say next will be interpreted. If it is correctly interpreted AND matches up with a speakable item, SR will open (execute) that item (command).

Adding Speakable Items

Simply put, adding icons of any kind to the Speakable Items folder adds commands to your SR system. As you may have noticed in the Speakable Items folder window, many commands are AppleScript macros. You can use the standard AppleScript Script Editor to create you own macros or edit existing ones.

Both English and Mexican Spanish TTS read aloud selected text when used with applications that support speech. Basically you simply highlights text, then select the application Speak command.

Speech Recognition is more complex. To speak commands and have SR execute them, you speak the computer's name, then the command. Commands are limited to what's in the Speakable Item folder. Add items to that folder to increase the number of commands you can have understood.

Mac OS 8.5: Apple Help Refers to Find Instead of Sherlock

The Find application has been replaced by Sherlock. This article discusses why Apple Help refers to Find instead of Sherlock.
This article has been archived and is no longer updated by Apple.
The Find application has been renamed Sherlock since in addition to Find File, it now provides additional capabilities of Find By Content and Search Internet.

Due to this late name change, Apple Help was not able to be updated to remove references to the Find application. The information about Find in Apple Help is accurate otherwise and previous methods of accessing the Find application, such as pressing the Command-F keys or selecting Find from Finder's File menu will open the Sherlock application. You can also select Sherlock from the Apple menu.

Mac OS 8.5: Map Control Panel No Longer Supported

I have installed Mac OS 8.5 and I can't seem to find the Map control panel and I want to set my particular time zone. Where is it?

This article has been archived and is no longer updated by Apple.

The Map control panel is not supported in Mac OS 8.5 and should not be used. Time zones are now set using the Date and Time control panel instead.

Published Date: Feb 18, 2012

A/UX: TCP/IP & AppleTalk Packets Can Coexist

Is it possible to have both TCP/IP and EtherTalk available and active at the same time under A/UX? If so, what is the procedure for doing this?
This article has been archived and is no longer updated by Apple.
AppleTalk (via either EtherTalk card or LocalTalk serial port) is supported under A/UX. AppleTalk printing and File Sharing services are two examples of this. A/UX also supports TCP/IP networks, so that A/UX users can connect to networks of computers running a variety of UNIX-based operating systems. Both EtherTalk and TCP/IP use the Ethernet hardware, and they can use the same Ethernet card. AppleTalk and TCP/IP are not mutually exclusive. That is, a computer running A/UX can be connected to a TCP/IP network at the same time that it is connected to an AppleTalk network.

You can connect a computer that is running A/UX to a LocalTalk network or to an EtherTalk network. Earlier versions of A/UX required a user who logged in as root to modify the /etc/appletalkrc file to select LocalTalk or EtherTalk. With A/UX 3.0, any user who can log in by using the Finder control panel to select LocalTalk or EtherTalk. The /etc/appletalkrc file is no longer provided.

For TCP/IP, once you have determined the values of the TCP/IP configuration parameters for your Macintosh, you can run newconfig to make a kernel that supports the TCP/IP networking software. To run newconfig, log in as root in the Finder environment and open a CommandShell window, or log in as root in the Console Emulator.

Type the command: newconfig bnet

Respond to the prompts that newconfig displays. When you have finished, restart the computer.

You can get additional information on this process by referring to the A/UX Network System Administration manual chapter on Configuring and Managing a TCP/IP Network.

Mac OS 8.5: Appearance Control Panel-Changing Smart Scrolling

When I enable the Smart Scrolling feature in the Appearance Control Panel under Mac OS 8.5, I get proportional scroll bars and dual scroll arrows at one end. I only want one of these features.
This article has been archived and is no longer updated by Apple.
It is possible to enable either one of these features by writing a simple AppleScript. Sample scripts follow:

1. Open the Script Editor from the AppleScript folder in the AppleExtras folder.

2. Make sure that "Smart Scrolling" is NOT checked on the options tab of the Appearance control panel.

3.

A. To enable dual scroll arrows only, type the following:

tell application "Appearance"

set scroll bar arrow style to both at one end

end tell

B. To enable the proportional scroll bar only, type the following:

tell application "Appearance"

set scroll box style to proportional

end tell

4. Click on "run". If you get an error, check for typographical errors and verify you are running Mac OS 8.5.

5. If there is no error, then the finder windows should now have the new feature. Save the script as a compiled script or application for future use.

To learn more about AppleScript, see AppleScript help in the help center or **http://www.apple.com/applescript/**.

iMac: Improper Repacking Can Cause Damage

How to avoid damaging an iMac during shipping or transport resulting from improper seating in the original Styrofoam packaging material.
This article has been archived and is no longer updated by Apple.
The difference between an improperly and properly packaged iMac computer is ensuring the computer is sitting flush with the bottom corners of the packaging.

Improperly Seated
This image shows an iMac which is not fully seated in the packaging. Notice the iMac corner is not flush with the Styrofoam. See Figure 1.

Figure 1 Improperly seated iMac

Properly seated
When repacking an iMac using the original packaging material, ensure the front bottom corners are fully seated to avoid damage during shipping or transport. See Figure 2.

Mac OS 8.5: Installing Mac OS 8.5 Read Me

The following is the Installing Mac OS 8.5 Read Me.
This article has been archived and is no longer updated by Apple.

Installing Mac OS 8.5

This document describes how to install Mac OS 8.5. It includes compatibility information, instructions for the Install Mac OS application program, and basic installation troubleshooting.

For more detailed information, the Mac OS 8.5 installation manual can be viewed at:

ftp://manuals.info.apple.com/Apple_Support_Area/Manuals/mac_os/0340643MOS85IM.PDF

Before you install

· Turn off any security software that you may have installed on your computer.

· If you have a PowerBook, make sure that it is plugged into AC power and set not to go to sleep.

· Start up your computer using the Mac OS CD-ROM disc. See your installation manual for instructions.

Note: If you're installing the Mac OS from a network, you won't be able to start up using the CD. Before installation make sure your computer has AppleShare software version 3.6.4 or later. See the document in the AppleShare folder in the Utilities folder for instructions.

If you can't start up with the Mac OS CD, or you're installing from a network, be sure to do the following additional steps:

· Turn off any virus-protection software that you may have installed on your computer.

· Disable all non-Apple extensions and control panels. See the installation manual for more details.

· Restart your computer before installing Mac OS 8.5.

Although compatibility problems are not expected, you can ensure a smooth upgrade by checking with the manufacturers of any non-Apple software you use to make sure it is compatible with Mac OS 8.5. If you do experience a problem, see the troubleshooting chapter in your installation manual for information on isolating compatibility problems.

Compatibility information

· Installing Mac OS 8.5 on computers with Ultra Wide SCSI cards

Some older Ultra Wide SCSI cards require a firmware update before they will work with Mac OS 8.5. If the card's firmware is not compatible, your computer will crash during installation or when you start up from the CD. Before installing Mac OS 8.5, contact the manufacturer of your Ultra SCSI card to determine if a firmware update is necessary.

· Internet Setup Assistant and LAN connections

If you connect to the Internet through a local area network, select the "add a new Internet configuration" option when you use the Internet Setup Assistant. Selecting the option to modify the default configuration will not correctly configure your TCP/IP settings.

· Third-party Finder and utility software

Some third-party programs that extend or add features to the Mac OS may be incompatible with Mac OS 8.5. Examples include programs that change the way menus work, change how files are stored, or alter the way you work with files in the Finder. Contact the software's manufacturer for information about using such programs with Mac OS 8.5. This is especially important if you're using a program that automatically alters the way files are stored (such as compressing them) because you might not be able to access those files until you obtain updated software for use with Mac OS 8.5.

· Computers with DOS Compatibility cards

Apple DOS Compatibility cards do not work with Mac OS 8.5. After you install the software, you will no longer be able to use your DOS Compatibility Card to run DOS or Windows software.

· Computers with PowerPC processor upgrade cards

You cannot use Mac OS 8.5 on a computer with a 680x0 processor that has been upgraded with a PowerPC processor upgrade card.

· 400K floppy disks and Mac OS 8.5

The 400K MFS disk format is not supported by Mac OS 8.5. If you have information or programs on 400K disks that you want to access, copy the files to your hard disk, an 800K floppy disk, or a 1.44MB floppy disk before installing Mac OS 8.5.

· PowerTalk and Mac OS 8.5

PowerTalk is not compatible with Mac OS 8.5. After you install Mac OS 8.5, you won't be able to access your PowerTalk mail or catalogs, nor will you be able to use your PowerTalk keychain or other services.

· QuickDraw GX and Mac OS 8.5

Application programs that use QuickDraw GX may not be able to print due to changes in the version of QuickDraw GX included with Mac OS 8.5. See the file About QuickDraw GX on the CD for more information.

· MacODBC and Mac OS 8.5

If you use MacODBC, you should either install it before installing Mac OS 8.5, or perform a custom install of MacODBC and make sure the ASLM extensions are not selected. The MacODBC installer installs older versions of ASLM extensions that are incompatible with Mac OS 8.5.

· Installing Mac OS 8.5 on accelerated NuBus PowerPC computers

If you have a Power Macintosh 6100, 7100, 8100, or 9150 with a third-party accelerator that increases the clock speed of your computer, the Installer might refuse to install Mac OS 8.5 because it doesn't recognize your system. Contact the accelerator's manufacturer for help.

· Performa or Power Macintosh 5000 and 6000 series computers

Some Performa or Power Macintosh 5200 series, 5300 series, 6200 series, and 6300 series models cannot use Mac OS 8.5 until a hardware problem is fixed. The repairs are covered under the Apple repair extension program. To see if your computer has this hardware problem, use the 5xxx/6xxx Tester utility in the Utilities folder on the CD before installation.

IMPORTANT The Power Macintosh or Performa 5260, 6320, and 6360 do not have this hardware problem and do not need to use the tester program.

Troubleshooting suggestions

Some Apple-branded disks manufactured by third parties, including the Apple 365 MB external hard disk, are not supported by the Apple disk utilities. If your disk cannot be updated with the Apple utilities, you'll need to use a third-party disk utility to update the driver.

If you see a message that your disk has problems and cannot be repaired, make sure file sharing is off, then try installing again. If that doesn't work, try using another disk-repair utility. If you don't have another utility, or if that utility also doesn't work, you may need to reinitialize the disk. Copy all your files to another disk first, as reinitializing erases the disk. For more information about reinitializing, see the manual that came with your computer.

If you experience problems during installation, be sure to start up with the Mac OS CD. See your installation manual for instructions.

If you're installing over a network, or if you have a non-Apple CD-ROM drive and can't start up with the CD, turn off all extensions that weren't provided with your system software. Then restart the computer. See your installation manual for instructions.

Additional troubleshooting information is available in the installation manual.

How IIGS Network Can Print From Single 3.5 Drive

I want to assemble an Apple IIGS system disk with the Chooser and other associated AppleTalk software that can use AppleWorks 3.0 on an Apple IIGS with a single 3.5 drive and networked ImageWriter II.

Here's what I need to know: What's the minimum ProDOS 8 system configuration that will allow this? Where do I get the required files, and how will I know if I've got the right versions?
This article has been archived and is no longer updated by Apple.
Since the associated AppleTalk software is contained within GS/OS for the Apple IIGS computer, start by using the GS/OS Installer to make a GS/OS boot disk. Install the "AppleShare on a 3.5 Disk" script. Once this has installed successfully, select the "AppleShare" script (NOT the "AppleShare on a 3.5 Disk" again) and press the "Remove" button. After this step is finished, select the "AppleTalk ImageWriter" script and press the install button.

This disk will be the boot disk for providing access to the networked ImageWriter. Contained on this disk will be all the needed system files to run both GS/OS applications and ProDOS 8 applications. Chooser.II is not needed because the Graphic Control Panel will be used.

Once the Apple IIGS has booted to the Finder, use the Graphic Control Panel's AT ImageWriter CDEV to select the desired network ImageWriter. This will leave the selected printer stored in RAM for use by AppleTalk protocols. It will also write the selected printer into the CDEV's resource file for use on the next bootup. Thus, if the same printer is desired, it will not need to selected again. Eject (with the drive button) the GS/OS boot disk, insert the AppleWorks disk, and double-click on the AppleWorks application icon. Be sure to specify the correct slot information about the printer within AppleWorks (slot 1 for O3 ROMs or slot 7 for 01 ROMs). AppleWorks will then work as Claris has designed it to work in a one-drive environment. When you exit AppleWorks, the system will return to the Finder.

If this operation is performed with the GS/OS 5.0.2 System.Disk and System.Tools, all the correct versions will be automatically installed.

Mac OS 8.5: Importing Existing Internet Configurations

I am upgrading to Mac OS 8.5 from Mac OS 8.1 which is already setup for accessing the internet through my ISP. Do I have to install and use the Internet Setup Assistant from Mac OS 8.5?
This article has been archived and is no longer updated by Apple.
If you are comfortable working with the AppleTalk, TCP/IP, and Modem control panels, you can bypass the Internet Setup Assistant to configure your computer for internet access. If you are not comfortable, Apple recommends that you use the Assistant to get your computer set up.

There are two methods for reconfiguring Mac OS 8.5 for internet access without using the Internet Setup Assistant; re-enter the information from scratch, or export your current configurations and import them back in after the Mac OS 8.5 install.

The following steps will guide you through exporting your current configurations and importing them back in after you upgrade.

1. Open the TCP/IP control panel.
2. Select Configurations from the File menu, or use the Command-K key command to open the Configurations window.
3. Select a configuration you wish to export then click the Export button, this will save the configuration to the folder of your choice. Do this for each configuration you wish to export.
4. Close both the Configuration window and the TCP/IP control panel.
5. Do the same with your AppleTalk control panel if you have different configurations.
6. Install Mac OS 8.5 without the Internet Setup Assistant.
7. After restarting, open the TCP/IP control panel and then the Configurations window.
8. Select Import and navigate to the folder containing the configurations you just exported.
9. Import each configuration, select the one you want to be active, then close the Configuration window.

Your TCP/IP control panel is now properly configured to access the internet. You will also have to export and import your PPP configuration information. This information will be in the PPP control panel or in the Remote Access control panel depending on if you were using Open Transport PPP or Remote Access to dial your ISP.

Mac OS X Server 1.x: Password not Working After Keyboard Layout Change

I'm trying to type in my password, which I know to be correct, but I am unable to log in. One of the changes I made during my previous session was changing the keyboard layout. Does changing the keyboard layout affect password entry?
This article has been archived and is no longer updated by Apple.
Note: This article pertains to Mac OS X Server versions 1.x, which were released prior to May 2001.

The keyboard layout effects not only what is typed, but how the data is sent to the computer. It may appear that you have typed the same information, but the computer thinks it is different.

If a password is typed using the USA keyboard layout and then the layout is switched in the Localization preference panel passwords will no longer work. This is also true if you FTP, Telnet, or rlogin to a computer using a different keyboard layout than what was used to create password.

The only way to fix this problem is to change your password. Select the keyboard layout that your password was typed with in the Localization preferences. In the Password preferences type in the original password when prompted. Go to the Localization preferences again and change the keyboard layout to the new layout. Go back to the Password preferences and type in the new password.

If you are trying to remote login (via FTP, Telnet, etc) to your computer, the computer you are on will also have to have the same keyboard layout selected. If you are on a Mac OS X machine you can use the Preferences, as described, to change to layout. If you are running on a non Mac OS X machine, contact the manfuacturer of the operating system. Note: this probably will not work. The layout may be operating system specific.

Mac OS 8.5: Token Ring Cards No Longer Supported

This article provides an alternate source for Token Ring products for Mac OS computers.
This article has been archived and is no longer updated by Apple.
Apple has exited the market as a vendor for Token Ring products. Apple has no plans for any new Apple-branded Token Ring products for Mac OS. The company also does not plan to offer any additional driver updates or hardware/software fixes for Apple's NuBus or PCI Token Ring cards. We will not be testing or shipping legacy Token Ring software in new releases of the Mac OS.

Even though no further products, updates, or fixes are planned, Apple continues to recognize that selected Mac OS users have an ongoing requirement for Token Ring products. Towards this end, Apple has been closely working with Madge to ensure the availability of 3rd party Token Ring products that are compatible with the latest Apple hardware and the Mac OS operating system.

Madge Token Ring products are available through authorized Madge resellers. Visit their web site at http://www.madge.com for more information.

TA43870_Macintosh_Portable_Developer_Issues_on_MIDI_Support_(TIL05815).pdf

Macintosh Portable: Developer Issues on MIDI Support

I was told there were some problems with MIDI software on the Macintosh Portable at introduction. What is the current status of this? What is Apple doing to fix the problems? What must a developer do?

This article has been archived and is no longer updated by Apple.
The only change since introduction is that most developers have provided an update to their software or have begun using Apple's MIDI Manager, or both. There are two support issues to be aware of when using an older version of MIDI Manager (1.1) and the Macintosh Portable. Both issues relate to the implementation of the serial ports of the Macintosh Portable.

1) Version 1.1 of the MIDI Management Tools does not support the Macintosh Portable.

MIDI Management Tools version 1.1 required changes to work correctly with the serial ports of the Macintosh Portable. These changes were implemented in version 1.2 of the MIDI Management Tools.

2) Some older versions of third party MIDI applications will have difficulty with the Macintosh Portable.

Until the introduction of Apple's MIDI Manager, all MIDI software had to write to the serial port hardware directly, bypassing the Macintosh Toolbox, to obtain acceptable performance. Writing to the hardware is not an ideal procedure for developers; Apple changes things about the hardware from one Macintosh model to the next. This forced MIDI software developers to revise their programs every time a new Macintosh model was introduced.

With the changes in design of the Macintosh Portable, these direct hardware calls and Toolbox workarounds no longer perform as they would on earlier models of Macintosh. Fortunately, Apple resolved this issue by providing the MIDI Manager. If developers use the MIDI Manager, they will not need to revise their programs as a result of any serial port changes in future computers. MIDI Manager will be revised as needed to deal with changes in serial ports. With MIDI Manager 1.2 or later, applications supporting MIDI Management Tools work correctly on the Macintosh Portable.

Make sure to use the most current version of the MIDI Manager to ensure that a program will communicate successfully with the serial port, regardless of Macintosh model.

Mac OS 8.5: Disabling Network Services Location Registry

Mac OS 8.5 includes Personal Web Sharing 1.5.1 which has a new option to register my web server on my network using the Network Services Location (NSL) technology. Can the NSL registry feature be disabled?
This article has been archived and is no longer updated by Apple.
Personal Web Sharing 1.5.1, by default, turns Network Services Location registry on. You may turn off the NSL feature by disabling the Mac OS 8.5 provided DNSPlugIn and SLPPlugIn extensions located in the System folder's Extensions folder. You can disable these extensions using the Extensions Manager control panel.

If you want Network Services Location activated for another application but want to turn it off for Personal Web Sharing, use ResEdit to open both the Web Sharing control panel and Web Sharing extension. Set string number 28 to zero for Str# 300. The Personal Web Sharing server should be stopped through its control panel before attempting to use ResEdit.

After this change has been made, you need to throw away the Web Sharing folder in the active System folder's Preference folder. Restart the server within the Personal Web Sharing control panel and the NSL registry will be off just for this Web Sharing server.

Note: Apple does not provide technical support for ResEdit. When using ResEdit, always work on a copy of a file rather than the original. Caution should be heeded prior to using ResEdit to modify any files.

AppleScript 1.3.2: Memory Leak Affects "Stay Open" Scripts

This article describes a known condition relating to AppleScript version 1.3.2 distributed with Mac OS 8.5.
This article has been archived and is no longer updated by Apple.
Apple is aware of a memory leak involving AppleScript 1.3.2 which ships with Mac OS 8.5. AppleScript scripts saved as "stay open" applications, and which make calls to Scripting Additions (OSAX), will experience a memory leak over time leading to their ceasing to function. We are investigating this problem and will provide more information as it is available.

Note that Mac OS 8.5.1 resolves this issue. The Mac OS 8.5.1 Update is available for download from Apple Software Updates sites.

For Mac OS 8.5 users, a workaround follows:

The work-around for the applet shell memory leak is to put all scripting addition commands inside a "Tell" block targeting an application. Since the Finder is always running, it is a good candidate for this purpose. For example, to use the "beep" command without leaking memory, you would write:

```
tell application "Finder"
beep
end tell
```

Please see the following articles for additional information:

Article 26165: "**About Mac OS 8.5.1 Update**"
Article 30865: "**Mac OS: What is a Memory Leak?**"

Mac OS 8.5: Multilingual Internet Access and Language Kit Updater

Information on the Multilingual Internet Access and Language Kit Updater included with Mac OS 8.5.
This article has been archived and is no longer updated by Apple.

Multilingual Internet Access

Multilingual Internet Access is an optionally installable component with Mac OS 8.5. It provides some of the previous features of Apple's Language Kits, including reading Web pages on the Internet. The language scripts supported are Arabic, Hebrew, Devanagari, Gurmukhi, Gujarati, Traditional Chinese, Simplified Chinese, Korean and Japanese.
Multilingual Internet Access does *not* replace Apple's Language Kits:

- In most cases, Multilingual Internet Access only includes one font for each of the language scripts. The Apple Language Kits include multiple fonts per language script.
- The 2-byte input methods for Traditional Chinese, Simplified Chinese, Korean and Japanese are not included, therefore text input is not possible in those languages without the use of language kits. Although text input is possible using the 1-byte language scripts, Apple will not be supporting this, due to the limited fonts included with Multilingual Internet Access.

Please see the "About Multilingual Internet Access" Read Me for more information.

Language Kit Updater for Mac OS 8.5

You must install the Language Kit Updater for Mac OS 8.5 (LKU8.5) in the following circumstances:

- After upgrading to Mac OS 8.5 from an earlier version of the Mac OS, with Language Kits already installed.
- Every time you install or remove one or more of the the following current Language Kits:
  - Arabic Language Kit 1.0.1
  - Chinese Language Kit 2.0, 1.2
  - Cyrillic Language Kit 1.0
  - Hebrew Language Kit 1.0.1
  - Indian Language Kit 1.0
  - Japanese Language Kit 1.2
  - Korean Language Kit 1.0
- If you custom remove a language kit or part (or all) of Multilingual Internet Access, you may also remove some files needed by your remaining language kits or Multilingual Internet Access language scripts. This is because of shared files. If this should occur, it is recommended that you reinstall either the language kit or the Multilingual Internet Access language script which does not work properly, after the custom removal. Again, remember to install the LKU8.5 each time a language kit is installed.
- Since LKU8.5 will update any of the above listed Apple Language Kits, there is no required order for the installation of multiple language kits, as long as the Language Kit Updater 8.5 is installed last.

The LKU 8.5 is located in the Language Kit Update folder in the CD Extras folder on the Mac OS 8.5 CD. Also included is a Read Me with further information. Any attempt to use the LKU8.5 with previous versions of the above Language Kits is not supported and therefore not recommended.

For further information, please see www.apple.com/support.

Mac OS 8.5: Sherlock and HTTP Proxy Settings

Does Sherlock honor the entries of HTTP proxies in the Internet Control Panel of Mac OS 8.5?

This article has been archived and is no longer updated by Apple.

Sherlock will use HTTP proxy entries from the Internet control panel. It honors both the HTTP proxy setting, and the bypass domains. Sherlock does not support SOCKS firewalls with this release. Sherlock also does not support HTTP Proxies that require user authentication, since there is no code to put up a dialog for the username and password.

Published Date: Feb 18, 2012

Mac OS 8.5: Modifying Number of Hits from Sherlock Search

When doing an Internet search using Sherlock, I notice the number of hits returned varies depending upon the search engine used. The number of hits also seems to be less than if I do the search at the web site itself rather than through Sherlock. Why is this?
This article has been archived and is no longer updated by Apple.
The Search Internet feature in the Sherlock application allows users to perform Internet searches using one or more Internet search engines. The Sherlock application itself contains no information about the exact data formats expected or generated by individual Internet search engines; when accessing any particular Internet search site, the Sherlock application uses a search plug-in file that describes the data formats both expected by the site for queries and produced by the site in its responses to queries.

Within the plug-in for a specific search engine are parameters for, among other things, the maximum number of hits returned on a search. If the plug-in specifies the maximum number of hits returned, that value can be altered by modifying the plug-in using your favorite text editor.

In most search plug-ins, the number of hits is signified by the "nh" input name. nh specifies the number of hits that should be returned in a response to a query. In the example below, the number of hits to be returned from a search is 25.

<input name="nh" value="25">

Not all search engines use the "nh" to signify the maximum number of hits returned on a search. For example, the Excite search plug-in uses "perPage" instead. Changing the value from "perPage" to some number will return up to that number of hits.

<input name="perPage" value="perPage">

For a plug-in which does not specify a value, it is possible to add one but you will need to first determine what input name is used to signify the maximum number of hits. To find the input name, begin by logging into the search engine through the web, we will use Lycos for this example. On the Lycos home page click on Pro Search and set the number of hits to be returned at 30, this number will be easy to recognize in the URL.

Perform a search on any topic. Once the search finishes, look in the URL string in your browser for the number of hits you selected, in this case, 30. That number will be preceeded by some text then the ampersand symbol (&). You will need the text back to the ampersand to enter into the Sherlock plug-in for that search engine.

In this case, Lycos uses "maxhits" as the term for the number of hits returned in a search. Now you are ready to edit the search plug-in. Open the Lycos plug-in in your text editor. You will see a number of lines beginning with <input name=... You will be creating one more line which should be exactly as follows:

<input name=maxhits value=30>

Close and save the Lycos plug-in and now when you search Lycos from Sherlock, the maximum number of hits returned will be 30.

More information regarding the modification, and creation of Sherlock search plug-ins can be found on the Sherlock web site; **http://www.apple.com/sherlock**. Clicking the Developer button will bring you to more detailed information relating to plug-in development and/or modification.

Mac OS 8.5: Adobe PSPrinter 8.3.1 Driver Conflict

Installation and use of the AdobePS 8.3.1 PostScript printer software on your Macintosh running Mac OS 8.5 can cause a system freeze or other printing related errors. For best performance, remove AdobePS 8.3.1 from Macintosh computers running Mac OS 8.5 and use LaserWriter 8.6 instead.
This article has been archived and is no longer updated by Apple.
Note: AdobePS 8.3.1 print software may get installed via the AdobePS 8.3.1 Installer, or via other installers that accompany some 3rd party printers and applications.

After removing AdobePS 8.3.1 from your Extensions folder, check that the proper PPD for your printer is located in the Printer Descriptions folder. Apple printer PPDs may be restored by reinstalling LaserWriter 8.6 from your Mac OS 8.5 Installer.

PPDs for 3rd party PostScript devices are usually included in the software that accompanied the product. Alternate sources for PPD files include the product vendor web site, or from the Adobe web site at http://www.adobe.com/ .

Mac OS 8.5: Error Opening Internet Control Panel or File Exchange

When opening the Internet control panel, I get an error stating "To use the Internet control panel, you must first install Internet Config Extension version 2.0, or later."

Also, opening the File Exchange control panel gives an error sating "Internet Config is not installed properly."
This article has been archived and is no longer updated by Apple.
Both the Internet control panel and the File Exchange control panel in Mac OS 8.5 use version 2.0.2 of the Internet Config Extension. However, several installers (typically web browsers and email programs) may automatically replace that extension with an older version.

To resolve, use the Mac OS 8.5 Installer and do a custom install of the Internet control panel. The installer will automatically reinstall the Internet control panel as well as the latest version of the Internet Config extension.

ASIP 6.0: Incorrect Date and Time in SMB File Properties

When I get Properties on a file on an AppleShare IP (ASIP) 6.0 server from a Windows client, the Modified and Accessed dates are not correct.
This article has been archived and is no longer updated by Apple.
Several Date and Time issues for SMB clients have been addressed in AppleShare IP 6.1.

In addition, please note the following items:

- Make sure that the date, time, time zone, and Daylight Saving Time options are correct on all client computers and on the AppleShare IP server.

- The Mac OS does not maintain an "Accessed Date" attribute, so this field is always set to the same value as the Modified Date attribute.

Mac OS 8.5: Obtaining QuickTime Pro Upgrade Key

Update and overview of the QuickTime Pro upgrade process.
This article has been archived and is no longer updated by Apple.

Background

The Mac OS 8.5 retail package includes QuickTime Pro; however, QuickTime Standard Edition is automatically installed with Mac OS 8.5. To get QuickTime Pro, you must register your copy of Mac OS 8.5 by double-clicking the "Register with Apple" icon on your desktop, or by visiting Apple's online registration web site at:
http://www.apple.com/register/

During the registration process, you will be asked to provide your e-mail address (twice, to eliminate typing errors) and a valid SKU number from the registration card included with Mac OS 8.5. If you enter an invalid SKU, you will not be able to complete the registration process.

Within one day after registration, you will receive an e-mail thanking you for registering and informing you that the QuickTime Pro upgrade key will be sent by e-mail within 7 days.

Customers Outside of the United States

Instructions for the registration process and data entry forms have been localized for European customers. At the initial registration screen, select a country from a pull-down list. At this time, some countries, including France, are missing from this list. Apple expects to have the remaining countries added shortly. In the meantime, you can select "other" from the list although the instructions will be in English.

If You Don't Receive Your Upgrade Key

If you have not received your upgrade key, you should verify that:

- you completed the registration process, and entered a valid SKU
- you entered a valid e-mail address that accepts e-mail from apple.com accounts
- it has been seven days since you registered your product

If it has been less than seven days since you registered, be aware that it may take as long as seven days before you receive the upgrade key. Otherwise, you may re-register, being sure to provide a valid email address that accepts email from apple.com accounts.

Customers Who Did Not Purchase A Retail ("Shrink-Wrapped") Copy Of Mac OS 8.5

Customers who did not purchase a retail ("shrink-wrapped") copy of Mac OS 8.5 but who wish to upgrade to the latest version of QuickTime should refer to Apple's QuickTime web site at:
http://www.apple.com/quicktime/upgrade/index.html

You can find answers to your questions about QuickTime at: **http://www.apple.com/quicktime/**

Note: Those who qualified to receive Mac OS 8.5 for $19.95, do not qualify for the free upgrade key.

Mac OS 8.5, Mac OS 9: Performing a Clean Installation

This technical document describes the clean installation procedure for Mac OS versions 8.5 to 8.6 and 9.0 to 9.2.2.
This article has been archived and is no longer updated by Apple.
Performing a clean installation creates a new System folder on your hard disk. The old System folder is renamed Previous System Folder. You may want to perform a clean installation if you are having persistent difficulties with your computer that a normal reinstallation does not solve.

Important: Because your computer has a new System Folder, after a clean installation you must reinstall third-party fonts, extensions, and control panels that you have added to your system or that came with programs you have installed.

The steps below assume that you are accepting the default choices for installing system software. You may customize what gets installed by manually selecting the various system software components after clicking Customize.

To perform a clean installation:

1. Start up your computer from the system software CD. You should use a version of system software that came with your computer, or later.
2. Open the Mac OS Installer application.
3. In the Welcome dialog box, click Continue.
4. In the Select Destination dialog box, click Options.
5. Select the Perform Clean Installation option, then click OK.
6. Select the destination hard disk, then click Select.
7. Click Start to begin installation.

After you're sure you've copied all the items you want to save into your new System Folder, delete the Previous System Folder from your hard disk.

Macintosh Display Cards Overview (3 of 3)

(This is a continuation of, "Macintosh Display Cards Overview (2 of 3)")
This article has been archived and is no longer updated by Apple.
- NuBus Block Transfer

One important display card acceleration feature is the NuBus block transfer function. Macintosh Display Card 8/24 GC supports both master and slave NuBus block transfer. Macintosh Display Card 4/8 and 8/24 support NuBus block transfers in slave mode only.

Most Macintosh systems do not support NuBus block transfer so this function is primarily a factor between NuBus cards with block transfer abilities. However, the Macintosh IIfx does support block transfers in slave mode only.

NuBus block transfer facilitates faster movement of data. Normally data is moved across NuBus in 32-bit words, 16-bit half-words, or bytes. Bus availability must be arbitrated between each word transferred. Under NuBus block transfer, the bus is arbitrated by the master, and then held while one address word and 16 data words are transferred to the addressed NuBus slave. Block transfer mode significantly accelerates the flow of data between the new display cards.

Because the Macintosh and many other NuBus cards lack NuBus block transfer support, another scheme is used to speed up data transfer between the Display Card 8/24 and other NuBus clients. Pseudo-block transfer is similar to block transfer in that it claims the bus for a 16 NuBus data word transaction; however, it must send an address word for each data word that it sends. The extra transfer activity makes pseudo-block transfer slower than block transfer but still an improvement over normal NuBus access times.

- Multiple Display Cards in One System

When multiple display cards are installed, the Macintosh Display Card 8/24 GC accelerates drawing in frame buffers of the Macintosh Display Card 4/8, 8/24, or other frame buffer cards. Display Cards 4/8 and 8/24 show the most improvement because they support slave NuBus block transfers and many other display cards do not. Acceleration for frame buffers other than the one resident on the Display Card 8/24 GC card would not be as dramatic because of the greater amount of NuBus traffic required. Only one 8/24 GC may be used for graphics acceleration in a system. If two cards are present, one will have its acceleration function disabled.

- Upgrades

The Macintosh Display Card 4/8 can be upgraded to Display Card 8/24 by using the Macintosh Display Card VRAM Kit.

The Macintosh Display Card 8/24 GC can be upgraded with the Macintosh Display Card DRAM Expansion Kit, which improves the performance of applications that use large off-screen bitmaps and other imaging methods.

System Software

System Software Version 6.0.5 or greater is required with Display Cards 4/8, 8/24 and 8/24 GC. Macintosh II, IIx ,and IIcx systems require the 32-bit QuickDraw patch file. Macintosh IIci and IIfx systems have 32-bit QuickDraw in ROM and require only System 6.0.5 or greater.

System Requirements

To use the Macintosh Display Card 4/8, 8/24, or 8/24 GC you need:
- A modular Macintosh II personal computer with an available NuBus slot
- System Software Version 6.0.5 or greater
- For Macintosh II, IIX and IIcx: the 32-bit QuickDraw software file is needed to run 24-bit color applications.
- To take advantage of full 24-bit color, a minimum of 2MB of memory is recommended.

Support Issues

- Cables For Current Portrait and Two-Page Display Customers

Current Portrait and Two-Page display customers must purchase a DB-15 to DB-25 adaptor when connecting any of the new display cards. Customers buying new Portrait and Two-Page displays will receive the proper cable.

- A/UX

The Display Card 8/24 GC will not initially work with A/UX. A/UX 2.0 compatibility is planned.

- Power Consumption

The Display Card 8/24 GC uses up to a maximum of 20 watts. In systems with all NuBus slots utilized, the power requirements of all cards installed should be added together to ensure that the NuBus power draw is not exceeded. Six-slot Macintosh modulars provide 90 watts for nuBus, 3-slot Macintoshs provide 45 watts.

- Macintosh II ROMs

The original Mac II ROMs had several problems that will not allow the Display Cards to function properly. There is a service program in place that will replace the original ROMs with new ones.

Connector Pinouts

Power Macintosh G3 (Blue and White): Enabler Built Into Software ROM and Mac OS

The enabler file is now merged with the Mac OS ROM file.

This article has been archived and is no longer updated by Apple.
There is no longer a stand-alone enabler. The Power Macintosh G3 OS is 8.5.1 (or newer) with modifications for the hardware.
Published Date: Feb 18, 2012

Power-On Self-Test Beep Definition - Part 1

What do the beeps during the Power-On Self-Test (POST) mean?

Refer to article 58442: "**Power On Self-Test Beep Definition - Part 2**" for information on more recent Macintosh computers.
This article has been archived and is no longer updated by Apple.
The power-on self-test resides in the ROM of the computer. Only computers that are based on the ROM-in-RAM (New World) technology, such as the iMac, Power Macintosh G3 (Blue and White), Power Mac G4 (PCI Graphics), PowerBook (FireWire) and PowerBook G3 Series (Bronze keyboard) will generate these beeps. This test runs whenever the computer is powered on after being fully shut down (the power-on self-test does not run if the computer is only restarted).

If a fault is detected during the test, you will not hear a normal startup chime. Instead, the system will beep as explained below. If you experience one of these beeps, you should call your Apple-authorized service provider for additional troubleshooting assistance.

1 beep = No RAM installed/detected
2 beeps = Incompatible RAM type installed (for example, EDO)
3 beeps = No RAM banks passed memory testing
4 beeps = Bad checksum for the remainder of the boot ROM
5 beeps = Bad checksum for the ROM boot block

Power Macintosh G3 (Blue and White): Behavior of Power Button Varies

This article lists the different ways the Power Macintosh G3 (Blue and White) responds when the Power button on the front panel is pushed.
This article has been archived and is no longer updated by Apple.
The response to the front panel button varies depending upon the current state of the Power Macintosh G3:

If the system is off it turns on.
If the system is asleep it wakes up and presents the Shutdown dialog box.
If the system is on and running it presents the Shutdown dialog box.
If the system is in a hung state it powers down the system (this may take up to 7 seconds to occur).

DAL: Client O.S. Runtime Environments

This article discusses DAL client operating system runtime environments.
This article has been archived and is no longer updated by Apple.

Macintosh

Data Access Language (DAL, formerly known as "CL/1") supports the Macintosh Operating System version 6.0.5 or later on all Macintosh hardware platforms with at least 2MB of RAM. The API is available in MPW C and Pascal object format, Think's Lightspeed C object format, and HyperCard XCMD/XFUNC format (embedded in DAL-HyperCard Help stack) for support of HyperCard 1.2 or later.

Host Servers

DAL supports the VAX/VMS operating system across the VAX hardware platform. This server supports the following DBMSs:

* Oracle
* Sybase
* Informix
* Ingres
* Rdb

DAL Server for A/UX supports the following DBMSs:

* Oracle
* Informix
* Ingres

DAL Server for VM/CMS supports the SQL/DS DBMS on VM/CMS systems.

DAL Servers for MVS/TSO and MVS/VTAM support the DB2 and Teradata DBMSs on MVS/XA and MVS/ESA systems.

Network Adapters (Communication Drivers)

Asynchronous

DAL supports async communications for VAX and A/UX with appropriate supporting hardware.

AppleTalk (ADSP)

DAL supports the AppleTalk Data Stream Protocol (ADSP) on Macintosh client systems running the ADSP driver software over the built-in AppleTalk connection or EtherTalk supporting hardware to VMS host systems running the DAL Server and AppleTalk for VMS.

ADSP Tool

DAL supports the Comm Toolbox AppleTalk Tool to VMS hosts running the DAL Server and AppleTalk for VMS.

Async CTB

DAL supports the Comm Toolbox async tools to VAX and A/UX DAL Servers.

3270 Connections

DAL supports 3270 connections on Macintosh systems equipped with hardware that supports the following 3270 solutions:

Apple MacDFT 1.1 running on:

* Coax/Twinax Card
* TokenTalk Card
* Serial NuBus Card

Tri-Data - Netway 1000, Netway 2000 - uses the Tri-Data API
Avatar - MacMainFrame - uses the Avatar API
DCA - MacIRMA Card - uses the MacIRMA API

SNA*ps Gateways running on:

* Coax/Twinax Card
* TokenTalk Card
* SDLC Card

APPC Connections

SNA*ps APPC Gateways running on any of the above NuBus cards.

Protocol Converters

Asynchronous access to protocol converters (front-ending MVS or VM) that access VT100-type output.

Apple Studio Display 17 and 21: Using VGA-to-Mac Adapter

This article provides information on connecting the Apple Studio Display 17 and 21 to computers with the standard Macintosh DB-15 video connector.
This article has been archived and is no longer updated by Apple.
The connector on your display cable is a VGA video connector (3-row D-Sub 15 connector shown below). To connect your display to a computer or graphics card with a Macintosh-type connector (2-row DB-15 connector), or to a graphics card with both VGA and Macintosh connectors, you need to use the VGA-to-Mac adapter that came with your monitor.

1. Turn off the power to your computer and connect the Macintosh (2-row DB-15) end of the adapter to your video card and tighten the thumbscrews.

2. Connect the monitor cable to the VGA end of the adapter and tighten the thumbscrews as shown below.

3. Power on the computer.

The viewable image size of the Apple Studio Display 21 is 19.8 inches, the Apple Studio Display 17 has a viewable image size of 16.0 inches.

Important: When using the Apple Studio Display 21, the USB connector is needed for your computer to work correctly with your monitor. If the connector is not attached properly, the software controls are not available.

Apple Displays: Changing the DDC Setting

This article defines the DDC setting and tells how to change it.
This article has been archived and is no longer updated by Apple.
DDC stands for "Display Data Channel," a communication protocol used by many displays for display/CPU connections. If the DDC setting is not correct, you will not be able to access all the resolution settings that your monitor and system will support.

You can change the DDC setting of the Apple Studio Display 17 and Apple Studio Display 21 by using the On-Screen Display controls (described in your Users Manual).

Most newer Macintosh computer models support DDC, so the default DDC setting on the display is ON.

Important: If you have reset the DDC control, turn the monitor off and then on again by pressing the power button at the lower right corner of the monitor's front panel, then restart your computer. Doing this ensures that the new DDC setting is enabled.

The viewable image size of the Apple Studio Display 17 is 16.0 inches.

DAL: Overview and Goals

Overview

Data Access Language (DAL, formerly known as "CL/1") is a host database access tool that provides a connectivity language and a set of supporting software components that link personal computer applications to host databases. The connectivity language conforms to the Structured Query Language (SQL) standard. DAL can be used to access host database data from the desktop, where it can be manipulated and presented using familiar personal computer applications. Host databases can only be relational in nature.

DAL provides uniform access to host database data across a wide range of host hardware platforms, operating systems, database management systems, and network connections. The role of DAL is to insulate the desktop application from these details and differences, allowing it to concentrate instead on providing better interaction between "personal" processing on the desktop and organizational computing on the host system.
This article has been archived and is no longer updated by Apple.

Goal of DAL

The goal of DAL is to provide an open, standard, host database access language that enables plug and play connectivity between desktop applications and organizational data. That is, a desktop application using DAL should be able, "out of the box," to access database data on a DAL-supporting host system and make that information an integral part of the data available to the desktop application user.

DAL gives software developers access to a broad range of shared database data through a single programming effort. DAL provides communications as a built in part of the runtime environment in the form of network adapters (communication drivers), thereby relieving the programmer from the burdensome task of communications programming. Because DAL lets packaged application software uniform access different host operating systems, database management systems (DBMSs), and networks, DAL lets software developers focus on integrating corporate data into their applications, rather than low-level networking and programming tasks.

Using DAL, the desktop application can describe a host data access request in a uniform, high-level way. The DAL server for the host system then carries out the request and returns the results to the desktop application. DAL provides automatic data translation when transferring data between the client and host systems. The language supports a set of standard data types
which are used to represent all data manipulated by DAL programs. Data from a host data source is automatically mapped into these standard data types when data is accessed. Descriptions of the host data source are also expressed in terms of the standard DAL types.

Apple Studio Display 21: May Be Difficult to Tilt

This article explains why it may take some force to tilt my Apple Studio Display 21 upwards.
This article has been archived and is no longer updated by Apple.
There is a detent when the display is sitting level in the tripod stand. The weight of the display provides resistance to upward movement from that detent.

Lift the front of the display by the small indentations on the left and right underside to tilt the display to an appropriate viewing angle.

Power Macintosh G3 (Blue and White): ADB and USB Devices Simultaneously Supported

It is possible to use both USB and ADB input devices on the Power Macintosh G3 (Blue and White).
This article has been archived and is no longer updated by Apple.
Be aware that if you have two similar input devices, such as a USB mouse and an ADB mouse connected simultaneously, the results are unpredictable and it is not recommended. However, using a USB mouse with an ADB keyboard, or vice versa, is fine.

At Ease: Cross-Linked Aliases

It is possible that when clicking an application in an At Ease pane a different application opens.
This article has been archived and is no longer updated by Apple.
There was an issue with At Ease that would cause it to occasionally open the wrong application. This has been fixed with At Ease version 5.0.2.

You can download the 5.0.2 update from Article 30864 **At Ease 5.0.2 Updater: Read Me**, which also contains information on additional fixes to At Ease.

If the aliases still do not function properly after the installation of version 5.0.2, one of the following suggestions should resolve the issue. Try them one at a time in the order shown below.

- Hold down the Command and Option keys while selecting your Panels workgroup. This gives you a dialog that says "Are you sure you want to rebuild the items for the workgroup". Select "Yes".
- From the Finder, throw away the At Ease Items WG 5.0 folder from the workstation, not the server. The At Ease Items WG 5.0 folder is recreated upon the next At Ease login.
- Remove and re-add the applications in At Ease Administration for the Panels workgroup which is opening the wrong application. Then repeat the previous step.

Apple Portrait Display: Specs and Pin Assignments

This article gives the specifications for the Apple Portrait Display monitor along with pin assignments for input signal jack.
This article has been archived and is no longer updated by Apple.

Picture Tube	15-inch (38.1 cm) diagonal Phosphor EIA Type B4 (White) High-contrast antiglare
Input Signal	Video: RS-343 standard Sync: Separate sync, negative going, TTL
User Controls	Power Switch (back panel) Brightness, with detent reference (right side) Contrast (right side)
Scanning Frequencies	Horizontal 68.85 kHz Vertical 75.0 Hz Dot Clock 57.2832 MHz
Resolution	640 (H) dots by 870 (V) lines
Active Video Display Area	Adjusted at the factory to produce an active video area of 8.0-inch (203.2 mm) horizontal by 10.8-inch (276.1 mm) vertical. The remainder of the screen is used for the dark border around the display.
Weight	35 lbs (16 kg), approximately
Power Requirements	75 watts maximum, all line conditions
Input Voltage	Operating range 85-270 Vrms, self-configuring Frequency 50-60 Hz
Operating Ambient Temperature	10 degrees C to 35 degrees C (50 degrees F to 95 degrees F)
Operating Humidity	90% maximum, non-condensing
Operating Altitude	10,000 feet (3,000 m) maximum
Fuse Protection	The monitor contains internal power line fuse protection. This fuse should be replaced with the same type be a qualified service technician.
Warm-up Time	20 minutes to meet all specifications

Pin Assignments For Input Signal Jack (D-25 Shell Style)

Pin	Function
A1	Monochrome video
A2	75 Ohms #1
A3	75 Ohms #2
1	Hsync return
2	Vsync
3	Sense #3
4	Sense return
5	Csync
6	Hsync

7	Vsync return
8	Sense #2
9	Sense #1
10	Csync return
Shell	Shell ground

Macintosh Server G3: Technical Specifications

This article provides the technical specifications for the Macintosh Server G3.
This article has been archived and is no longer updated by Apple.

Technical Specifications

Processor

- 350- or 400-MHz PowerPC G3 processor
- 1MB backside level 2 cache on processor, running at 175 or 200 MHz depending on processor speed
- 100-MHz system bus

Memory

- 128MB or 256MB of PC100 SDRAM (3.3-volt, unbuffered, 64-bit-wide, 168-pin, running at 100 MHz)
- Four DIMM slots support up to 1GB of PC100 SDRAM using the following DIMMs:
  -32MB, 64MB, or 128MB DIMMs (64-bit-wide, 64-Mbit technology)
  -128MB or 256MB DIMMs (64-bit-wide, 128-Mbit technology)

Storage*

- One of the following hard disk drive configurations:
  -One 9GB 7,200-rpm Ultra2 LVD SCSI drive with PCI card
  -Two 9GB 10,000-rpm Ultra2 LVD SCSI drives with PCI card
- 24x-speed (maximum) CD-ROM drive
- One or two expansion bays for additional Ultra Wide SCSI or Ultra2 LVD SCSI drives

Interfaces

- **Connectivity**
  -Two 400-Mbps FireWire ports
  -Two 12-Mbps Universal Serial Bus (USB) ports
  -Apple Desktop Bus (ADB) port (maximum current draw for all ADB devices is 500 mA)
- **Communications**
  -Built-in 10/100BASE-T Ethernet connector (RJ-45)
- **Expansion**
  -Four PCI slots: three 64-bit, 33-MHz slots (one of which contains the Ultra2 LVD SCSI card) and one 32-bit, 66-MHz slot (dedicated to the ATI RAGE 128 graphics card)
- **Video**
  -15-pin mini D-Sub VGA connector and Macintosh-to- VGA adapter
- **Sound**
  -Minijacks for 16-bit stereo audio input and output; 44.1-kHz sampling rate
  -Built-in speaker

Keyboard and mouse

- Apple USB Keyboard and Apple USB Mouse

Electrical requirements

- Line voltage: 115V AC (90V to 132V AC) or 230V AC (180V to 264V AC)
- Frequency: 47 to 63 Hz, single phase
- Maximum continuous power (not including display): 200W

Environmental requirements

- Operating temperature: 50° to 104° F (10° to 40° C)
- Storage temperature: -40° to 116° F (-40° to 47° C)
- Relative humidity: 10% to 90% noncondensing
- Maximum altitude: 10,000 feet (3,048 m)

Size and weight

- Height: 17.0 inches (43.2 cm)
- Width: 8.9 inches (22.6 cm)
- Depth: 18.4 inches (46.7 cm)
- Weight: 28.7 pounds (13.0 kg)**

*Storage devices and number of available expansion bays vary among configurations; see Available Configurations chart for details. Other configurations are available as build-to-order options from the Apple Store.

** Varies depending on configuration. Example includes CD-ROM drive and Ultra2 LVD SCSI hard disk.

SDRAM: Difference Between 64 Mbit and 128 Mbit Technology

This article describes the difference between 64 and 128 megabit (Mbit) SDRAM technology.
This article has been archived and is no longer updated by Apple.

Symptom

Apple Specifications support 128 megabyte (MB) SDRAM DIMMs using both 64 and 128 megabit (Mbit) technology on certain computers. However, the difference isn't explained.

Affected Products

- Power Macintosh G3 (Blue and White)
- Power Mac G4 (PCI Graphics)

Solution

As of the writing of this document, high capacity memory modules were possible by stacking two 64-Mbit chips placed together in the same package. Higher capacity SDRAM DIMMs would eventually be out of specification due to the number of lower density chips.

However, using 128-Mbit devices allow higher density memory DIMMs that meet the specification for power consumption, size, and performance.

In the case of the Power Macintosh G3 (Blue and White) and Power Mac G4 (PCI Graphics) 128 MB DIMM, that memory size is the point where either 64- or 128-Mbit technology memory devices can be used.

Important: 256 MB DIMMs must use 128-Mbit technology in order to be functional in the Power Macintosh G3 (Blue and White) and Power Mac G4 (PCI Graphics).

Fiber Distributed Data Interface (FDDI): Description (9/94)

What exactly is FDDI?

This article has been archived and is no longer updated by Apple.

FDDI stands for Fiber Distributed Data Interface and is an American National Standards Institute (ANSI) standard. Their fiber optic LAN standard is for a token-passing, counter-rotating ring that sends data at 100MB per second.

The ANSI X3T.9 committee took IEEE 802.5's token-ring standard and optimized it for fiber. The services provided on an FDDI network are a superset of the services that 802.5 provides; in general, any software that runs over 802.5 should run over FDDI, only faster. This speed is at least six times greater than the three IEEE 802 LAN standards. Even though 802.3 (Ethernet), 802.4 (token bus and MAP), and 802.5 (token ring) all can be implemented with fiber, they do not take advantage of fiber's capacity.

A FDDI network counter-rotating ring means you have two fiber cables instead of one. Normally only one cable will carry data; the second is used when a cable fault occurs to the first. A station is either single attached (connected to a concentrator which is connected to the ring) or dual attached (connected to both fiber cables directly onto the ring). When two neighboring dual attached stations detect a fault, they bring up the secondary data path. Hence the need for every dual attachment device to have management capabilities built in. Dual attached concentrators are used to interface single attached nodes to the ring. Concentrators will have multiple ports to accommodate multiple single attached devices. Concentrators may also be single attached, but will always be on a link that is eventually connected to a dual attached concentrator attached to the ring. With concentrators, you can build a physical star topology offshoot to the ring network.

The maximum circumference of an FDDI network is 100 kilometers (or 200 kilometers if you count both rings), and supports up to 500 stations (1,000 physical connections to both rings). The maximum distance between two active nodes cannot exceed 2 kilometers, so unless all nodes are active all of the time, the FDDI network will probably be less than the 100-kilometer maximum.

Though the recommended transfer rate is 100MB per second, you could send data on both rings simultaneously for a 200MB transfer rate. Although the data rates on the FDDI ring remain constant when loaded, a station's access time to the network may decrease depending upon the station's priority. Sustained data transfer rates for a 100MB implementation is approximately 80MB per second, due to overhead bits, token passing times, and so on.

FDDI is implemented at the Data Link and Physical layers of the Open Systems Inconnection (OSI) seven-layer model. The basic fiber-optic link consists of an optical transmitter, optical receiver, fiber-optic cable, and optical connection.

The next generation of fiber-based high-speed LANs is already being looked into by the ANSI X3T9.5 committee. One that is upwardly compatible with FDDI, that adds voice and video capability, is FDDI-2. FDDI-2 specifies a time-division multiplex approach to divide the available network bandwidth between voice and data.

Power Macintosh G3 (Blue and White): SCSI Card Compatibility with Apple Scanners

On a Power Macintosh G3 (Blue and White) with an Apple SCSI card installed, the scanner driver may not load; its icon appears during startup with a red X through it. Further, scanning software does not recognize the scanner.

This article has been archived and is no longer updated by Apple.

The Apple Scanner extension version 4.2 does not support the Apple PCI SCSI cards available for the Power Macintosh G3 (Blue & White).

Apple has released Apple Scanner version 4.3 to address this issue available from the Apple Software Updates Web site at http://www.apple.com/swupdates/ .

Convert2DOS Read Me

This article is comprised of the Read Me for Convert2DOS. This software was released by Apple on January 21, 1999 and is available for downloading from Apple Software Updates Online. Click here to access this update: **Download**

Name: Convert2DOS

Version: 1.0

Released: May 26, 1998

Requires:

Convert2DOS has been tested on US versions of MacDraw Pro, and requires a Mac or equivalent with a 68030 or better, a high-density floppy drive, System 7.x, PC Exchange or Apple File Exchange, 50 K of free disk space plus space for converted files, 2.5 MB of RAM (more for optimum performance)

Description:

Convert2DOS is a Macintosh application that takes MacDraw Pro files and creates a set of files in IBM-compatible format so you can open your MacDraw Pro files in ClarisDraw for Windows or ClarisImpact for Windows without altering your original MacDraw Pro files.

Instructions:

This software consists of a self-extracting archive. To use, download it to your hard drive and then double-click it to decompress the software.

This article has been archived and is no longer updated by Apple.

Convert2DOS - Macintosh to Windows

Convert2DOS takes MacDraw Pro® files and creates a set of files in IBM-compatible format so you can open your MacDraw Pro files in ClarisImpact® for Windows. Convert2DOS does this without altering your original MacDraw Pro files.

What you need

To use the Convert2DOS, you need the following equipment and software:

- a Macintosh computer or equivalent with a 68030 processor or better
- a 3.5-inch high-density floppy disk drive
- Macintosh System Software 7.0 or later
- PC Exchange or Apple File Exchange
- approximately 50 K of free disk space plus space for the converted files
- 2.5 MB of RAM (more for optimum performance)

Converting MacDraw Pro files

You can convert MacDraw Pro files by dragging them onto the Convert2DOS application icon, or by opening them from within Convert2DOS. If you drag a file onto the application icon, Convert2DOS automatically creates the necessary converted files and names them according to a standard set of rules. If you open a file from within Convert2DOS, you can name the converted files yourself.

Converting MacDraw Pro files automatically

To convert MacDraw Pro files automatically:

1. In the Finder, select the MacDraw Pro file you want to convert. Shift-click any additional MacDraw Pro files you want to convert.
2. Drag the file or files onto the Convert2DOS application icon.

In the Save Converted Files dialog box, select the name of the directory (folder) where you want to save the converted files and click Select Directory.For each MacDraw Pro file you convert, Convert2DOS creates two files in the directory you select, one with the extension .MDP and one with the extension .RES. Convert2DOS creates the eight-letter roots of these file names based on the name of the original MacDraw Pro file. (For more information on how Convert2DOS automatically names converted files, see "File Naming Rules" later in this file.)

Converting MacDraw Pro files from within Convert2DOS

To convert MacDraw Pro files from within Convert2DOS:
